Overall, this work supports the idea that procedural justice is a widespread societal value determining how authority should be wielded, at least within certain contexts (Trinkner and Tyler 2016). But do the sources of empirical legitimacy vary from one country to another? In contexts that (a) have high levels of crime and (b) have legal institutions that have not yet shown their ability to secure a basic level of security, police effectiveness may be a stronger antecedent of court legitimacy than procedural justice. In line with this expectation, some studies have found that effectiveness is at least as important as procedural justice in terms of predicting police legitimacy (in Ghana, see Tankebe 2009; in South Africa, see Bradford et al. 2014; in Pakistan, see Jackson et al. 2014; and in Japan, see Tsushima and Hamai 2015). But, generally speaking, procedural justice is a relatively consistent predictor of police legitimacy in countries across the world (Kochel et al. 2013; Jonathan-Zamir and Weisburd 2013; Hough et al. 2013a, b; Cheng 2015, 2016; Murphy et al. 2016; Sun et al. 2017; Brouwer et al. 2017). It seems, looking across the available evidence, that process matters when police power is exercised – that underpinning the normative justification of police power is the importance of treating those they protect and regulate with dignity and respect, behaving in neutral, unbiased ways, showing trustworthiness and a willingness to help citizens, and allowing citizens voice and agency in interactions (Trinkner and Tyler 2016; Trinkner et al. 2017).

## The Motivational Qualities of Empirical Legitimacy

The law is the single most powerful general purpose tool available to government for regulating the behavior of diverse individuals with diverse values and interests. Deterrence and legitimacy are the two key mechanisms through which the law regulates behavior. Consider stealing. While most people probably view stealing as wrong, one could quite easily imagine a subset of individuals who believe that stealing is morally permissible, or at least morally ambiguous, in certain circumstances. If deterrence motivates the latter group's behavior, those individuals would nevertheless refrain from stealing – irrespective of their views on the rights and wrongs of stealing – so long as they judge that the risks and costs outweigh the benefits of the act of stealing. If legitimacy is a motivator, they would refrain from stealing because they have internalized the overarching moral value that one should obey the law *because it's the law*. The overarching moral value "kicks in" even when more specific views on the rights and wrongs of stealing fail. In both cases, deterrence and legitimacy hope to provide a *content-independent safety-net* of social regulation.

When considering legitimacy as a reason to act, it is useful to position legitimacy within Bottoms's (2002) four categories for the explanation of compliance with authority in general, and with the criminal law in particular:

1. Prudential or self-interested calculations about the potential costs and benefits of breaking the law, taking into account the risks and costs of punishment
2. The impact of obstructive strategies, such as locking up offenders to prevent their reoffending, and locking up the targets of criminal attention, literally or metaphorically
3. Normative considerations about the "rights and wrongs" of noncompliance
4. Habit

Legitimacy forms part of people's normative considerations about the "rights and wrongs" of noncompliance, stepping in when moral values, social norms, and habit do not apply. Importantly, legitimacy provides a motive to obey the law rather than a motive to act consistently with the law. Acting consistently with the law means conforming with the law for reasons independent of the law – it means "…engaging in the same behavior we would have engaged in even if no laws regulating it existed" (Schauer 2015: 6). That there are laws against stealing – that one could face punishment if one were caught and

prosecuted – is tangential to law-consistent behavior (as indeed are obstructive strategies). Each time you do not steal something because (a) you think stealing is wrong, and/or (b) you think others will disapprove, and/or (c) you are not in the habit of stealing – which as McAdams (2015) argues is a proximate reason that ultimately requires further explanation back in time – then this is law-consistent rather than law-abiding behavior (Schauer 2015). By contrast, legitimacy means treating an order or rule as "superseding and replacing one's own judgement" (Bottoms and Tankebe 2012: 135). People internalize a general moral obligation to obey the law through the associate obligations, positional duties, and affective bonds that legitimate power structures generate and maintain.

To empirically isolate the content-independent motivational force of legal legitimacy, criminological studies tend to adjust for key predictors of legal compliance and offending behavior in their statistical analysis. A UK study found that duty to obey the law predicted legal compliance, adjusting for the morality of the criminal acts and normative alignment with the police (Jackson et al. 2012b). An Australian panel study into tax fraud showed a link between legitimacy and offending behavior, adjusting for perceived risk and personal morality (Murphy et al. 2016). A study of "active offenders" as part of the Chicago Gun Project found that individuals with social networks that were saturated with gang members tended to have more negative views toward the law and legal authorities, and that legitimacy was a significant negative predictor of carrying a gun (but not of fighting), adjusting for an index of deterrence (Papachristos et al. 2012).

There is, however, a complication. Duty to obey emanates from a recognition of institutional normativity, yet the moral force of the law obviously has value content. The normativity of the law may be evident in people's belief that the laws that are generally enforced in one's community align with one's sense of right and wrong and that members of one's community should obey the law to help maintain a mutually beneficial scheme of social cooperation (cf. Rawls 1964). In a national US study, Trinkner et al. (2017) found that duty to obey was a significant negative predictor of past criminal behavior (e.g., buying something that might be stolen, taking something from a store without paying for it, and illegally disposing of rubbish or litter), even after adjusting for normative alignment with the law (as well the judgments about the risk of sanction and the morality of buying stolen goods, shoplifting, dumping rubbish, and so forth). This increased these authors' confidence that duty to obey was playing a content-independent role in explaining variation in compliance with the law, precisely because they could disentangle duty to obey from normative alignment.

On the topic of obligation, the duty to obey component of the legitimacy concept is generally seen to be "truly free consent," i.e., a kind of obligation grounded in the active and positive recognition of an authority's right to govern (Tyler and Jackson 2013). In the context of the police, however, there is some debate about whether obligation should be equated with legitimacy (Bottoms and Tankebe 2012; Tyler and Jackson 2013; Tankebe 2013; Johnson et al. 2014; Jackson et al. 2016 cf. Kelman and Hamilton 1989). The issue is largely methodological. Do standard legitimacy indicators "pin down" a normatively grounded form of obligation to obey the police? Could people respond positively to attitudinal statements like "*you should accept the decisions made by police, even if you think they are wrong*" and "*to what extent is it your duty to do what the police tell you even if you don't understand or agree with the reasons?*" not because they feel a normatively grounded moral duty to obey, but because they feel powerlessness to do otherwise? One way to assess whether legitimacy indicators are really capturing "truly free consent" is to assess their correlations with other theoretically relevant constructs. Indicators like "*I feel a moral obligation to obey the police*" and "*I feel a moral duty to support the decisions of police officers, even if I disagree with them*" have been shown to be negatively correlated with more instrumental and/or strategic forms of obligation, and strongly and positively correlated with procedural justice, normative appropriateness, and identification with the role of "law-abiding

citizen" (e.g., Jackson et al. 2016). While this suggests that it is reasonable to include duty to obey within the legitimacy concept, more work is needed on other forms of obligation, as well as strategies to distance oneself from (or resist) demands from legal authorities (see, e.g., Braithwaite et al. 2007; Murphy et al. 2009; Etienne 2011; Murphy 2016). In addition, the idea of legal estrangement (Bell 2017) may be an interesting way to frame future research and debate.

## Widening the Scope of "Motivation"

An interesting feature of the legal legitimacy literature is its disconnect from work into the expressive function of law despite some points of potential overlap. In a recent essay on two jurisprudence books (Schauer 2015; McAdams 2015), Nadler (2017) provides an engaging account of the idea that "the law influences attitudes and behaviour through what is expresses" (p. 63) and the notion that information and coordination are key to the expressive function of the law. McAdams (2015) describes how the content of law signals to citizens what authorities and other citizens deem to be counter-normative (information) and by shaping expectations about how others will behave (e.g., whether they will engage in disapproving or censuring behavior), the content of law helps to coordinate behavior. As Nadler (2017) illustrates, a "no-smoking" sign not only expresses widespread social disapproval for the act, it also empowers others to intervene if one is smoking, and a potential smoker might take this into account when deciding whether to light up.

Although pure speculation at present, it is possible that judgments of the normative appropriateness of the law (i.e., the belief that the laws in a community generally align with citizens' sense of right and wrong and that enforcing those laws helps to provide a mutually beneficial scheme of social cooperation) trigger or strengthen existing information and coordination mechanisms. People who believe that collective obedience with the law maintains the moral consensus that helps a community to function may be more open and responsive to information and coordination signals, assigning not only greater importance to cooperative norms, and other people's views and actions regarding the normativity of compliance. A concerted effort to tighten up the enforcement of laws proscribing the downloading of content that infringes copyright (combined, say, with a communication campaign) might help shift people's values regarding illegal downloading, especially when they are normatively aligned with the law. If one is generally committed to the idea that legal compliance and law enforcement helps to build and maintain moral consensus, one may be more open and responsive to cooperative norms and counter-normative signals.

Normative alignment may play a similar triggering role in the context of the police. For instance, a recent study found that the stronger the experience of procedural justice (in a recent road traffic stop), the higher the levels of normative alignment with the police, the stronger the agreement with the idea that drive-drinking is immoral, and the greater the willingness to comply with traffic laws in the future (Jackson 2015). On this account, a positive encounter with police – one that affirms a sense of shared values and appropriate standards of behavior – may signal the appropriateness of police authority, the appropriateness of policing this sphere of action, and the appropriateness of the particular law that officers are enforcing at that moment. The officer uses her power and authority in morally appropriate ways; she treats the citizen with respect and dignity; she underlines the importance of road safety; and this helps to persuade citizens of the morality of these particular traffic laws.

This chimes more broadly with social-psychological literature regarding social/descriptive norms and consensus information. When facing doubt, uncertainty, or periods of strain (such as involvement in the criminal justice system), individuals may consult others, particularly those in positions of authority (like police), to validate and reaffirm beliefs and values. Discussion, observation, or events such as traffic stops and arrests can elicit periods of social "stocktaking" that convey feedback information

about prevailing cultural attitudes toward certain types of behavior (i.e., illegal downloads, speeding, drink-driving, and so forth). Shared uniformities (or divergences) in attitudes provide referent information to individuals as to their position within a certain group and the "rightness" of their beliefs relative to other group members (Turner 1984). As individuals consult these descriptive norms, or those social norms which indicate how most – or at least, *valued* – others might behave in a given situation, they can use "majority" behavior as an adaptive or prescriptive heuristic to guide conduct (Duguid and Thomas-Hunt 2014). Discovering that similar others (whether similarity is experienced cognitively, or normatively) appear to validate one's beliefs and attitudes – that there is an apparent "consensus" behind these values – provides positive feedback information (that the law is "right") and coordination (that others agree).

To close, as with Trinkner et al.' (2017) work regarding illegal internet downloading (as well as some of our own research pertaining to the police's ability to, in many ways and for many groups, dictate the bounds of legitimate police authority, see Bradford et al. 2017; Huq et al. 2017), legitimacy may be a more fluid concept than often approached. There may be multiple motivational qualities underpinning why people shift their views about the normativity of law and legal institutions. But at its core, legitimacy revolves around norms and values, and a consensual normativity between individual and power-holder. It is a sense of shared norms that both constitutes legitimacy and provides its central motivating power.

# Employee (Labor Management) Relations

Bill W. K. Taylor
Department of Public Policy, City University of Hong Kong, Kowloon, Hong Kong

## Synonyms

Critical labor studies; Employment relations; Human resource management; Industrial relations; Industrial sociology; Labor and employment relations; Labor problem; Labor relations

## Introduction

Employee relations or labor management relations introduce three areas: definition of the term, the subset of public sector issues, and the country case of China.

## Definition

Defining the subject has proved very tricky with official definitions, such as from the International Labour Organization (ILO) or governments, often creating as much confusion as clarification. Definitions have often become descriptions with several sentences, ambiguities, exceptions, and clarifications. The problem of definition stems from the political or ideological color which each attempt to define the subject is laden. Defining labor management relations in terms of whether an employment contract exists between two parties, for example, establishes whether a labor management relationship exists and clarifies some formal terms of that relation. Thus, if the parties were to recourse to a legal dispute with one another, the nature of the relation could be established. Moreover, this allows a distinction to be made between a contract for services (employment contract) and an independent contractor (contract the service). However, such a definition ignores a whole host of elements which go into the relationship between labor and the employers, the organizations which are involved, and the timeline from preemployment to retirement which develops between them. Thus, a useful definition seeks to embed legal (a contract) or economic (wage labor exchange) relations in the broader and deeper social context.

Labor management relations are concerned with the relationship between an individual who is employed and the employer and/or the managers who direct an individual's labor. The relationship carries two interrelated elements: an individual relationship between a worker and his or her boss and a collective relationship which stems from the collective or, at least, interdependent nature of work (Burawoy 1979). An individual worker interacts with other workers necessarily as part of their work whether directly or through machines, but also their identities and expectations as workers are shaped by the community in which they live, family relations, and wider networks.

The context to the employment relationship is usually considered in three broad overlapping areas: economic, political, and social.

Economically, the price of labor or wage/salary and the expectations thereof the employer and employee are shaped by the cost of living, cost of employment, inflation, and so on. Politically, ongoing relations between employers and employees are inherently political, with discernible power dynamics, but also more formally, policies, laws, and political institutions have an impact in shaping these power relations. Socially, gender, race, sexual orientation, age, and a host of other factors shape the perceptions of self and the other party to the relationship, and the views on these at a psychological and material level are largely shaped socially.

Given this complexity, academics have often used an institutionalist approach to researching and teaching the subject (e.g., Dunlop 1958). Such institutions include companies, labor unions, third-party intermediaries, governments, and increasingly nongovernment organizations (NGOs). Using a systems approach, these institutions interact through established procedures and activities. Thus, there may be an established legal right for trade union members not to be intimidated by an employer simply because they belong to the union. The institution of the government grants or protects by the procedure of passing a law to grant rights to institution of a labor union which restrict the activities of the institution of employer with regard to their employees. For example, discriminatory wage differentials based on gender are not the product of laws or economic factors but the lack of social urgency to force this into the political agenda to be resolved. This compares to slavery, which appears as prevalent as ever in human history, but is tucked away from global north sensibilities. A similar social peculiarity exists in the way public violence is aggressively suppressed, but probably equally prevalent domestic violence is protected and largely ignored. Thus, the social context is crucial to understanding relations generally (Hyman 1975).

All this takes place within a context of competing ideologies. Ideas of liberalism, conservativism, and radicalism shape how individuals think the relations between labor and management should be, and many conflicts can arise from such normative influences (Fox 1974). Even the idea of the employee is an ideological loaded term: a worker, a proletariat, and an individual who works can be described as carrying out their duties, laboring, doing their job, and bearing the yoke.

## Public Sector

The public or government-controlled sector has often been in the forefront of managing employment issues and has justifiably been identified as taking the lead in establishing practice (whether best or worst) for the private sector to follow. In the area of labor management relations, public sectors often had awkward conditions, as some of the rules or assumptions in the subject do not seem to apply. For example, the employer's ability to pay is not directly based on either the productivity of labor or its success in providing its product or service to others, so there are no guidelines to set wages and salaries or other terms and conditions of employment. Some governments, such as that in Hong Kong, attempt to create pay parity where public sector occupations are benchmarked against similar ones in the private sector. However, several occupations are unique to the public sector (police, cartographers), or the number employed is proportionally so high (veterinarians, schoolteachers), and the state dominates demand for labor groups, resulting in effectively monopolistically setting the price of labor for all. From a narrow viewpoint, the wage the government eventually settles on appears artificial with the forces previously described, political, social, economic, and ideological, as well as the institutions of labor unions, employer organizations, political parties, and so on; all interact such that the price of labor (wages and salaries) is set and the mechanisms by which it is set (procedure) are managed within this complex context (Kochan and Katz 1988). For example, until the 1960s police pay in Hong Kong matched average local salaries for similarly semi to low skill jobs. Some police employees engaged in corruption and extortion to supplement their pay, and as part of a settlement when a clampdown on such practices occurred, police salaries became markedly higher.

Market forces which are traditionally seen to impact the price of labor are here substituted for a different set of considerations which nevertheless include an economic dimension, as well as the political, social, and ideological factors.

Although there are varying degrees of relative employment size and range of occupations comprising the public and private sectors, across different countries and historically within each, some groups are more often associated with the public sector. Military, judiciary, and police are usually but not always public sector employees. Education, health, and social service within Europe and Japan were also public sector areas from the 1930s to 1980s. In communist periods in countries such as Russia and China, almost all employment was public sector. Public sector employment has been associated not only with protections, such as secure employment and often less arbitrariness than private sector employers, but also restrictions in some places and periods. In the United States some government jobs even at the local level are decided politically, either through election or appointment by political parties or elections. More commonly certain occupational groups are prohibited from withdrawing their labor during disputes with the employer (going on strike) or even from joining a trade union. For example, it is almost universal that the military and judiciary (certainly judges) are so restricted. In the UK the police cannot strike and rather than join the union their employer recognizes a "professional" association. In Japan, the US occupiers in 1948 prohibited public sector workers from going on a strike, a restriction that persists today, but in practice the public sector in Japan has taken the lead in both union growth and industrial action.

To understand public sector employment relations or labor management relations, it is usually necessary to consider the power that various parties hold. In the private sector, it is common to see that in the long run economic power is of primary importance: the employer's ability to pay and the workers' ability to control their labor. If the employer cannot easily move their operations to another location or country, or they make large profits that can be retained within the firm (i.e., not siphoned off by the owners), and if ideologically predisposed, they will probably be willing to have comparatively higher pay or terms of employment for their employees. If workers are able to organize a union strong enough to restrict access to the labor market or have unique skills in high demand, they may similarly pressure employer to give higher pay or terms of employment (Braverman 1974). In the public sector, political and social forms of power are more important, as the examples above have shown. Comparing the employment of casual or short-term contract workers in China and Hong Kong's public sector provides a useful illustration. China has embraced the so-called mixed economy of public and private sector employment with significant areas of manufacturing and resource extraction remaining in public ownership, in contrast to Hong Kong, where public sector employment is restricted to certain service areas. As part of the neoliberal ideology that spread since the 1980s, Hong Kong, in line with many governments internationally, has tried to reduce costs by employing casual, temporary, and subcontracted labor to undertake clerical jobs. However, local public sector unions and staff associations have insured that skilled occupations have not been contracted out and temporary labor is usually monitored by full-time employees. By contrast, in China, there are instances where complete factories have been emptied of their full-time workers and short-term contract workers drafted in. As China has no labor unions, existing workers have little power. There is, however, another layer to this illustration; in China, by using the rhetoric of its socialist past, national level advocates for social stability were able to pass legislation to restrict the use and equalize terms and conditions of employment of such casual labor to reduce their cost advantage over full-time employment. In contrast in Hong Kong, backed by the same interest groups as in China and a strong neoliberalist ideology, vulnerable sectors of the working population have few legal protections and the differences remain.

Thus, employment relations in the public sector both impact and occasionally shape practices in the private sector, but the basis of relations is quite different because the economic link between work and pay (broadly defined) is less important

than the political context which itself is more heavily influenced by ideological considerations. In the twentieth century, there were successive attempts to professionalize management in the public sector, but since the 1980s, there has been a spread of an ideology based on the pretence that various sections of the public sector can be managed as if they were private sector business units. An extreme form of this neoliberal project is privatization of former public sector activities, although governments have often attempted to artificially create markets using their monopoly power to achieve this. Invariably, the result has been increasingly adversarial employment relations in the public and former public sectors.

## China

Employment relations in China developed rapidly from the 1980s and has so attracted a substantial amount of interest both internationally and increasingly among domestic scholars and practitioners. For political reasons domestic scholars usually claim the Chinese system has unique characteristics, which reflect the pretence at socialism with the real market economy. This refers to China being a socialist market economy, in which workers are supposed to retain an important, if not dominant, role within society, but at the same time, capitalist market forces are encouraged. In practice, this is an oxymoron as markets necessarily create tensions between employers and employed, and moreover China has perhaps the most rapidly expanding and certainly volatile capital financial markets in the world, which have enabled rapid growth of capitalists, both domestic and, to a lesser extent, foreign.

China has been a totalitarian state throughout its history, with a party claiming communist credentials taking control in 1945 (Perry 1993). All government appointments to the local level are controlled by a corresponding party committee established at the corresponding level, which also supervises the actions and behaviors of officeholders. Although this tight control appears unitary, a number of factors create a degree of pluralism within the party and government: regional differences, levels in the hierarchy, and functional responsibilities create a limited degree of diversity and flexibility. The Ministry of Human Resources and Social Security (MHRSS), like labor ministry's elsewhere, is primarily responsible for employment matters. However, in China, instead of labor unions, the state operates a bureaucratic organization which claims to act in employees' interests, called the All-China Federation of Trade Unions (ACFTU) (Taylor et al. 2003). In practice as a party-state organization, its functions often overlap that of the MHRSS, resulting in conflicts, and it functions as a government organ completely detached from workers.

There are three types of employers presently in China: private enterprises formed by citizens which increasingly incorporate their firms and domestic sometimes foreign stock exchanges, foreign enterprises, which were initially restricted to being joint ventures and often retain co-ownership with domestic capital, can state-owned enterprises which may be owned nationally, provincially, or locally. During the period since the early 1980s, the differences between these three types of employers have become less obvious, but it has taken time for state-owned enterprises to rid themselves of the socialist era obligations toward their workers. Prior to the 1980s, managers were promoted often for their technical expertise and especially their party credentials, and although party membership remains important for career progression in many large organizations, a new cohort of more professional managers is developing, sometimes with international experience. Nevertheless, employment relations and human resources have generally lagged behind other areas of management sophistication and education in China.

In the 1980s and 1990s, workers in state-owned enterprises were seen as a vanguard in many senses. First, they formed the skilled labor force of the reform period, disciplined, with technical and tacit knowledge, and competent in industrial work. Second, their identities drew on their elevated status during the communist period, and they were reluctant to accept the subordinated status that came with capitalism (Walder 1986).

After 30 years of reform, such workers, who had known guaranteed wages, housing, welfare, and other rights, have gone. Their position was eroded quickly by the introduction of a secondary labor market employing former agricultural workers flooded into industrial and coastal areas by the millions (and later, by privatization). A strict registration system ensured the new workers were not entitled to the same benefits as former state-employed workers enjoyed, becoming a discriminated underclass in cities (Gallagher 2005). These migrant workers created a flexible labor pool for the growing export-oriented economy, especially near Beijing, in Shanghai, and the Pearl River Delta.

The development of the migrant labor system may be divided into three stages. The first wave were young men and mostly women who went to factories and coastal cities to find employment for the period between leaving school and getting married or having a child. They saw their industrial jobs as temporary, to provide money to family members and to start their life back in their home village. These workers tended to avoid conflict with employers and usually skipped between jobs quickly, resulting in very high labor turnover rates and an extreme fluid labor market. Employers organized work around such volatility and generally made little effort to develop relationships with their employees (Pun 2005). These practices are similar to those in the early developing economies elsewhere, especially in Asia. A second generation of migrants were usually the sons or daughters of first-generation migrants or had contact with such migrants, but these workers were less willing to return to a peasant life. While this second generation returns to the villages when there were no jobs and might even marry someone from the village, they kept on working in the coastal areas and might even keep their child with them, banding together with other migrant parents to provide some sort of schooling as their children were denied access to urban schools. These workers began to push employers and the local state to improve employment conditions and in the face of employer resistance found it was easy to pressure local government officials to force employers to meet their demands. Initially the local governments responded with brutality, but as the number of petitions, strikes, and public demonstrations mushroomed (Chan 2010), many city and provincial governments sought a more conciliatory approach. Often this involved arresting ringleaders while at the same time forcing employers to comply with worker demands (Chan 2011). Currently there is debatably a third generation of migrants evolving, who, born in the city and still holding subordinate registration, have become urbanites and are in fact unable to make a livelihood back in the villages where their registration remains but they may never have visited. These workers, emerging in the last 5–10 years, are literate, sophisticated, and tech savvy; they appear to have a strong sense of social justice for which their registration is anachronistic.

In summary, employment relations in China has three core features. First, the totalitarian regime has attempted to establish a framework of laws and regulations to manage employment relations, which on the surface appear to create a mature basis for the conduct of conflict avoidance and timely conflict resolution. However, in practice, the system is designed to ensure challenges to the single-party state are suppressed, and inadvertently this has created a situation where workers in the first instance rely on the state to resolve employment conflicts rather than bothering with their employers. Second, contingent upon this has been the suppression of any organization which represents workers, be it trade union or NGO, and as workers' demands escalate, the ACFTU has shown to be quite useless. In its place local government officials, the police, the judiciary, and local MHRSS officials attempt to resolve conflicts as they arise and instruct the ACFTU local officials when necessary. Third, the simple employment relations at the workplace usually have little institutional framework to resolve problems, and the level of the employer-employee conflict is both high and ever escalating. The result of which is increasing wages such that China's low-cost economic development model is being challenged.

## Conclusion

The inherent power relations which underpin employment or industrial relations may be understood with respect to the specific institutions and process (formal and informal) through which they are conducted (Nichols and Beynon 1977). The intricacies of the government in the public sector are both the employer and the regulator of employment. China, as a country example, shows how, even within a totalitarian regime, the economic, social, and political relations between employers and the employed mediate and counter the power of even the most highly oppressive governments.

## Synonyms

Allowances; Compensation packages; Fringe benefits; Perks; Rewards

## Definition

Employee benefits are typically the part of aggregate compensation set, other than salary offered to the employees once or in parts at different times. These are the additional rewards and

compensations besides their pay, which are not necessarily in the form of cash but they may include insurances (such as group, health, family, accident), benefits after retirement, sick leaves, vacation, or education funds.

## Introduction

Employee benefits are basically any forms of compensations that are offered by the employer organizations in addition to wages and salaries which may be paid once or in parts. These benefits might be paid to the employees together with their salaries or separately at once or sometimes in parts. Employee benefits may be offered to employees on the basis of their performance, demands, and needs, or overall performance, efficiency, and economic growth and sustainability of the organization which in turn is dependent on the profitability and income of the organizations. Performance-based benefits are only offered to the employees who perform better as compared to others. Some organizations increase employee benefits when their financial position rises; they give bonuses and incentives to their employees who are the real performers behind their success and growth. As per the Herberg's two-factor theory of motivation and hygiene, the employee benefit programs are essential and adequate conditions for smooth working, the hygiene aspect affects the work motivation of employees which in turn affects their performance and productivity (Hong et al. 1995). Hence, the employee benefit programs become crucial for the organizations aspiring to maintain employee satisfaction and increase their commitment with the organizations. Besides the mandatory benefits, the employers need to provide some fringe benefits which motivate the employees. The examples of employee benefits are diverse which include (but are not limited to) retirement plans, employee child and elder care, programs of hospitalization, social security, vacation, as well as paid holidays (Christoph 1996).

Employee benefit programs have largely sought the attention of management due to the yearly escalating cost which resist the efforts of cost control (Dreher et al. 1988). To control these costs, some organizations deducted cash contributions related to certain benefit plans and probed employees to adjust from their salaries (McCaffery 1988). For instance, in 1990s, the organizations raised the deductible as well as monthly contribution of the employees on their health insurance for covering medical costs. As a result, it put more burden on the employees to pay larger part of the benefits offered to them by their employer organizations. As a result, the employees felt difficulty in supporting their families. This in turn resulted in the dissatisfaction which led to the adverse feelings of the employees and made them to bargain with their leaders, which in turn reduced their interest and performance at the workplace (Reuter 1990; Mullahy 1989). In this situation, the response and support of their leaders will be useful to lower their dissatisfaction level and boost up their performance, weaken their intentions to switch their jobs (Siyal and Peng 2018; Siyal 2018). The supportive leaders are always seen to strive for the benefits of their employees. This support of the leaders helps them to build good social relations with their employees and subordinates.

Studies pertaining to employee benefits are getting importance by the researchers due to several reasons such as: they influence the organizational commitment (Christoph 1996), motivation and productivity (Hong et al. 1995). Researchers from economics, psychology, and sociology fields illuminate and broaden the understanding about the way employers design employee benefits which motivate them to increase and speed up their performance in the form of productivity in diverse settings of tasks and assignments (Gerhart and Rynes 2003). The employee benefit strategies and their long-lasting implementation often rely on the motivation of employees towards specific benefits of their choice and demand. For instance, the employees mostly endeavor to boost up their performance and be well at workplaces which offer pension plans, as it is very helpful for them in the time when they are not able to work and earn living for survival (Day 1996). The coming trends in terms of employee benefit programs

influence the attitudes of employees which seek the attention of employers to address the varying needs and desires of the employees by revising the current benefit plans. In doing so, the organizations need to follow more effective and employee-driven approaches which may be useful in revising employee benefit plans. This may require scrutiny of the existing benefit systems and their potential to motivate employees and cope with the variations in their needs and desires (CAHRS 2006). Hence, the employers are seen to take extensive endeavors in redesigning their employee benefit plans to meet the needs and demands of their employees so as to sustain and positively influence their performance.

## Types of Employee Benefits: Do They Really Matter for Employees?

The employee benefit plans greatly matter for the employees; they act as motivators and influence their performance and commitment with the organization. The current literature highlights two conditions for employee benefits; first, the benefits are major part of overall compensation being offered to the employees. Second, employee benefits have been less studied by the researchers and are one of the ignored areas with a very few empirical evidences found in the extant literature. The first argument shows the importance and practical implications of the employee benefits, while the latter specifies the scope as well as complexity of conducting research in the area of employee benefits. It is due to the reason that studies in the employee benefits have not been forthcoming which indicates that the employee benefits need to be studied in diverse ways. Employee benefits differ from employer to employer ranging from medical and related assistances, retirement and saving plans, being paid for the time employees did not work, life insurance and benefits to family after death of the employee, and various miscellaneous benefits. The miscellaneous benefits include but are not limited to family-friendly, for instance, maternal leave, sick leave, for self or dependents, financial support for the dependents (which maybe children, parents, or younger siblings), flexible scheduling, and work timings. Hence, all of the employee benefits have been categorized into four main types on the basis of Maslow's hierarchy theory (see Fig. 1).

Based on the Maslow's hierarchy theory (Anastasiadou and Zirinoglou 2015), there are main 27 employee benefit plans that are classified into four major forms or welfare demands which include physical demands, security demands, social demands, and self-actualization demands (including personal or self-demands). Firstly, the category of physical-demand benefits comprise loans, surpluses and dividends, bonuses by the year end, subsidies of savings, subsidies for emergencies, annual leaves, national holidays, leave with pay, benefits of dormitories for single and housing for family, equipment for food/drink and subsidies for meal, and the facilities of hairdressing and laundry. All these benefits mostly fulfill the physical demands and needs of the employees, their dependents and family. Secondly, security-demand benefits cover day care services, group insurance of dependents (including both life and medical), pensions, compensation for occupational diseases, benefits for the education of children, supply of goods on discount, medical equipment and subsidies, free availability of traveling vehicles, and subsidies for commuter. All of these benefits are sufficient to meet the security needs of employees along with their families. Thirdly, the category of social-demand benefits mainly covers equipment for entertainment and activities (including clubs and foreign travels), equipment for education and activities (including lectures, drawing, and calligraphy), subsidies for traveling abroad, measures for counseling, and maternity as well as paternity leave. Fourthly, the self-actualization-demand category of employee benefits (including self-esteem) consists of openings along with the subsidies for further advanced education/ training as well as flexible work hours. This category of benefits helps the employees to avail the opportunities for further education and trainings useful to effectively and efficiently perform their duties and assigned tasks at their workplaces. The

**Employee Benefits, Fig. 1** Types of employee benefits

opportunities may be within or outside of their country which will add to their skills, expertise, and experience to learn more advanced, efficient, and innovative ways of working.

## Foreword to the Problem: How Employee Benefits Evolved

The evolution of employees' benefits is best described by the deprivation theory perspective (Grosby 1976). This theory was developed for explaining civil conflicts which occur when elongated times of prosperity and affluence offer relaxation to the miserable economic situations. The theory contends that people expect high due to the prolonged history of prosperity and become hopeful of its continuity. And when it does not happen so, an inconsistence situation develops in which they keep finding themselves. Further, it postulates that the sharp fall in the prosperity violates the employee expectations which make people feel deprived and dissatisfied which leads to add discontent (Martin 1981). People feel deprived, resented, and grieved mostly in two situations. First, when they observe discrepancy among actual and expected outcomes, second, when they experience incongruity in between the outcomes and benefits they get and the outcomes and benefits they deserve.

In the perspective of employees, the employee benefits evolved with a close resemblance to the concepts of theory of deprivation perspective, such as in case of United States, employee benefits evolved in a way same as the J-curve of this theory which shows steady growth in the offered benefits and their cost in past decades, while recently the cost of these benefits have been observed to decrease and decline in several cases. A certain part of these benefits is accredited to the federal regulation which made it mandatory for organizations to offer several benefits which include compensation, social security, etc. Ultimately, the voluntarily offered employee benefits started increasing and employers began thinking that these benefits may be useful in attracting and

retaining the productive and efficient human resources (Siyal and Peng 2018; Siyal 2018). Hence, the employers started offering more benefits due to the exemption or discount in buying the group benefits for their human resources such as health insurance, plan for retirement, and leave with pay. In providing health insurance for the families of their workforce, the employers had to pay extra for their families and at the times in 1970s and 1980s when the prices for health insurance were increased. In addition, the workforce in past was homogenous, having male as the head of the family which caused the similarity in demands of employee benefits plans. However, the today's workforce is heterogeneous, reflecting diverse needs and demands for the benefit plans as compared to the ones in past. These benefit plans are much more elaborate and expensive which are required to meet the demands and satisfaction of the today's workforce.

## Do Benefits Matter for Employees?

Over the last couple of decades, lot of countries are experiencing the issues in terms of dissatisfaction of employee benefits which may or may not result in the rise in turnover or fall in their performance. Most of the younger employees often switch their jobs and move to the ones offering increased salaries and more benefits but the older employees are more likely to end up their services and take early retirement. For instance, in 1960s, more than 80% of the employees ending up their services were between the age group of 55–64 years in the United States which reduced to 68% in the mid of 1985 due to the reason that organizations keep on revising employee benefits as per their demands (U.S. Department of Labor 1988). This number kept on decreasing day by day, as today's retirement rate is approximately four employees per each retiree and this number is supposed to decrease to 2.5 by 2030. To reduce this number to least, the organizations are working to identify the interests of their employees so as to make changes in employee benefits plans and packages which meet the needs of their employees individually and as a whole. As stated above, the increasing heterogeneity in the human resources of different organizations makes it complex and varying due to the differences in the needs of male and female employees working in the organizations on different positions including the managerial and labor. The male employees may have different demands in the form of employee benefits offered by the employers and females have different. Consequently, it can be said that the employee benefits do matter for employees of all the levels (including managerial and labor).

## Consequences of Reduction in Employee Benefits

In the recent times, the fall in employee benefits and the shift in their cost from employers to employees has been a serious concern which is caused mainly due to the economic concerns. The employers usually lower the labor costs by lessening the small portion of their wages and devote that to the benefits they offer to them. Whereas the strategy of reducing the employee benefits by reducing labor cost may be useful to some extent but it may lead to the adverse outcomes for the organizations in several ways. A very few studies have discussed the consequences of reducing the employee benefits and to what extent it might be deteriorative to the organizations. Regardless of increase in the cost of employee benefits, the research in terms of its influence on the attitude and behavior of employees is very scarce in the current literature (Gerhart and Milkovich (1992). However, the current findings have suggested the adverse consequences which may arise as a result of reduction in the employee benefits. The occurring consequences depend on the extent of reduction in the benefits of employees, and the adverse outcomes may range from the slight dissatisfaction to severe consequences which include disgrace, resentment, and anger linked to the ruining of psychological contract, fall in trust, loyalty, performance, and organizational commitment, besides it also adversely affects the relationship of employers to their employees.

## Strategies to Prevent the Adverse Consequence

The employers always seek to enhance their competitiveness by following their strategies which usually require to reduce the cost of benefits and labor. Though it advises a need of reducing the benefits and shifting the costs, it also argues that most of these practices have the possibility to adversely affect the attitudes and behaviors of employees. Hence, it recommends to investigate and identify the alternative approaches for replacing the reduction in benefits and cost shifting. Currently, the main challenge of the employers and organizations is to recognize and develop strategies of reducing the cost of benefit plans without the risk of possible adverse outcomes in general and specifically the one which violate the psychological contract. The changes in the attitudes and behaviors of employees are adverse for the organizations and affect their proficiency and performance. Keeping in view these challenges, there are some recommended approaches which fill this gap between the expected benefits by employees and the offered benefits by employers. These recommended approaches are classified into main three categories which include: first, those emphasizing on the expectations of employees in terms of their benefits; second, those focusing to satisfy the needs of employees; and third, those who involve their employees in designing and administrating their own benefit plans.

## Conclusion

Employee benefits are very important for the employees regardless of the type of organization they work for. This chapter discusses four main categories of employee benefits based on the Maslow's hierarchy theory; the types of benefits include physical demands, security demands, social demands, and self-actualizing demands. In addition, the consequences of reduction in employee benefits and shift in the cost of benefits, and the strategies to avoid such consequences are also discussed.

# Employee Engagement in Public Administration

Francesco Arcidiacono, Carmela Di Mauro and Alessandro Ancarani
Department of Civil Engineering and Architecture, University of Catania, Catania, Italy

## Synonyms

Personal engagement; Work engagement

## Definition

Employee engagement is a positive, fulfilling, work-related state of mind that is characterized by vigor, dedication, and absorption (Schaufeli et al. 2002).

## Introduction

The concept of engagement became popular in the Organizational Behavior literature in the early 1990s. Kahn (1990) defined personal engagement as "the harnessing of organization members' selves to their role [by which they] employ and express themselves physically, cognitively and emotionally during role performances" (p. 694). This definition stresses the nature of engagement as a positive psychological state and pinpoints its multidimensionality. Schaufeli et al. (2002) enriched the construct of work engagement by framing it as a "a positive, fulfilling, work-related state of mind that is characterized by vigor, dedication, and absorption." Vigor is characterized by high levels of energy and mental resilience on the workplace and by the readiness to invest efforts in one's work and persevere also in demanding conditions. Dedication involves experiencing feelings of significance, enthusiasm, inspiration, pride, and challenge. Absorption implies being so concentrated and engrossed that time spent working is pleasant and passes quickly, and that it is difficult to detach from work. Although, "employee engagement" and "work engagement" are used interchangeably in literature, in this contribution the former label is preferred in light of its broader meaning. In fact, work engagement refers to the relationship of the employee with his or her work, while employee engagement may also include the relationship with the organization.

## Outcomes of Employee Engagement in Public Administration

In analyses of the public sector workplace, the concept of employee engagement has consistently been associated with relevant, positive outcomes both at individual and organizational level (Fig. 1). From an individual perspective, in fact, engaged public employees have been found to experience higher levels of job and life satisfaction and to show good mental health (De Simone et al. 2016; Simbula 2010). Additionally, as far as perceptions of work environment are concerned, employee engagement reduces reported levels of red tape (Torenvlied and Akkerman 2012).

In terms of job performance, high levels of employee engagement have been linked to increased efficiency, proficiency in performing tasks and organizational commitment (Eldor 2017a; Hakanen et al. 2006). Embracing an organizational-level perspective, employee engagement enhances knowledge sharing and transfer of training (Nazli and Khairudin 2018; Tamta and Rao 2017).

## Antecedents of Employee Engagement in Public Administration

By virtue of its beneficial outcomes, research has endeavored to investigate the determinants of employee engagement in the public sector. In this respect, the job demands-resources (JD-R) theory (Demerouti et al. 2001) has provided a valuable interpretative framework. According to the JD-R theory, every work environment can be characterized in terms of job demands and job resources. Job demands refer to those physical, social, and organizational aspects of the work context that are associated with physical or

**Employee Engagement in Public Administration, Fig. 1** Literature review: summary of positive outcomes tied to employee engagement

psychological costs for employees. On the other hand, job resources indicate physical, social, and organizational elements of the work environment that are critical to the achievement of work-related goals, reduce the physical and psychological costs caused by job demands, are functional in stimulating employees' growth, learning, and professional development. As a result, while job resources trigger a motivational process that fosters employee engagement, job demands induce a health impairment process, which depletes employees' mental and physical resources, leading to burnout and, eventually, to ill health.

Job resources in the public sector can be organized into four categories, namely, positive social interactions, positive job characteristics, positive features of organizations, and leadership (Fig. 2). Positive social exchanges can be both horizontal – TMX, or team-member exchange – and vertical – LMX, or leader-member exchange (Ancarani et al. 2017) – and are therefore embodied by supportive colleagues (Guidetti et al. 2018; Tadić et al. 2014) and supervisors who provide support (Guidetti et al. 2018; Hakanen et al. 2006), performance feedback (Tadić et al. 2014), and compassion (Eldor 2017b). Furthermore, specifically in the health-care sector, beneficial social interactions stemming from positive physician/patient relations have been documented (Hakanen et al. 2005).

Another stream of research has focused on positive job characteristics, and has shed light on fundamental factors that should be considered and incorporated during the process of job design, in order to stimulate employee engagement among public employees. Well-designed jobs, in fact, should guarantee civil servants autonomy (Hakanen et al. 2005; Breevaart et al. 2013) and job control (Hakanen et al. 2006), and require skill variety (Hakanen et al. 2005). With respect to characteristics of public organizations, it appears that it is possible to operate along two dimensions in order to promote employee engagement among civil servants, namely, enhancing perceptions of organizational support (Gillet et al. 2013) and shaping appropriate organizational culture and climate. In particular, organizations should show their support by guaranteeing access to information (Hakanen et al. 2006) and providing opportunities for personal and professional development (Tadić et al. 2014), which could take the shape of an organizational climate that promotes learning (Eldor 2017a). Additionally, perceptions of fair treatment, transparency, and sanctionability in

case of unethical behavior have been linked to organizational trust and justice (Tamta and Rao 2017), two factors that positively influence employee engagement in the public sector. Furthermore, a research conducted on a sample of Italian public hospitals (Ancarani et al. 2019) has demonstrated that an organizational climate focusing on internal human resource development and offering them empowerment is conducive to engaged workers. Interestingly, contributions highlighting the beneficial impact of an innovative climate on employee engagement among teachers and public dentists (Hakanen et al. 2005, 2006) may hint that, especially in some areas of the public sector, employees could be inclined to give their support for the organization change-oriented efforts. Finally, a few studies have focused on the contribution of leadership styles over engagement in the public context, and have proposed that ethical and transformational leadership, in addition to contingent reward, are antecedents of employee engagement (Lu and Guy 2014; Breevaart et al. 2013).

As far as job demands in the Public Administration are concerned, it is possible to trace back their origins to four sources (Fig. 3). First, fear of changes: studies have shown that anxiety caused by uncertainty connected to imminent changes negatively impacts on public employees engagement (Guidetti et al. 2018; Hakanen et al. 2005). From this result, the importance of expanding the use of change management practices in public organizations emerges as a central recommendation. Second, stress determined by work environment and arising from excessive bureaucracy, hassles, role conflict, and adverse physical work environment have been found to be

**Employee Engagement in Public Administration, Fig. 3** Summary of job demands in the public sector

negatively related to employee engagement (Tadić et al. 2014; Hakanen et al. 2005). Next, job dissatisfaction, a term including job impoverishment, lack of training, role ambiguity and which, to a certain extent, can be considered the negative *alter ego* of that class of job resources named "positive job characteristics" (De Simone et al. 2016; Tadić et al. 2014). The fourth and final category contains negative social interactions that drain civil servants' energies and hence have a detrimental effect on their work engagement. In particular, conflict with colleagues, emotional dissonance, and lack of social recognition have been found to weaken the relationship between resources and employee engagement (De Simone et al. 2016; Hakanen et al. 2005; Lu and Guy 2014).

To conclude, it is worth discussing the complex network of relationships linking employee engagement to a key construct in Public Administration studies, namely, Public Service Motivation (PSM). PSM captures "an individual's predisposition to respond to motives grounded primarily or uniquely in public institutions or organizations" (Perry and Wise 1990). Bakker (2015) proposes that high daily levels of vigor, dedication, and absorption positively influence PSM, as engaged employees believe that their work is meaningful and has a positive impact on society. At the same time, PSM reinforces the link between job resources and engagement and the relationship connecting engagement and performance. In fact, civil servants guided by prosocial motivation are inclined to fully exploit job resources, which, in turn, foster employee engagement. Additionally, PSM drives engaged employees to direct all their energies toward the common good, hence influencing their outcomes. As a result, employee engagement and PSM play a concurrent role in determining civil servants' performance.

## Conclusion

Today the public sector is called to increase its efficiency and improve quality of services provided, while cuts in public expenditure call for an optimized use of resources. In this demanding context, the importance of fostering work engagement among civil servants has emerged, especially in light of its beneficial impact at both individual and organizational level. As a result, public organizations and managers should be aware of the determinants of work engagement in the public sector to develop intervention plans aimed at fostering it among civil servants.

## Introduction

This entry will provide a comprehensive survey of the rights of public employees in the United States through an interpretation of US Court rulings. During the twentieth century, the US Judiciary dramatically shaped the balance between supervisory and employee rights. Each case analysis will evaluate whether the Court's majority expanded or restricted the scope of employee rights in the public sector. The entry will not only provide a chronological evolution of landmark court cases over the past 125 years but an analysis of the legal rationale of each decision in several key areas of employment law. Such areas as due process, First Amendment rights of free speech and expression, privacy rights, equal protection, Civil Rights Act of 1964, and Fourth Amendment search and seizure law. Within each legal issue area, the prevailing legal doctrine or standard will be summarized and then explained further through the Courts development of the case law.

The entry proceeds as follows. The first section briefly summarizes the development of the rights-privilege concept of public employment law. The next section discusses the substantive and procedural due process rights for hearings. The third section analyzes the extent of free speech rights in the public sector. The fourth section exclusively covers the privacy rights of public employees. The fifth section evaluates the effectiveness of antidiscrimination case law. The sixth section looks at the extent of liability, immunity, and remedies for public employees. The seventh section analyzes the decisions that have determined the extent of Fourth Amendment rights of public employees in the workplace. Finally, the concluding section summarizes the effects of the rulings on the current state of employee rights in the public sector.

## The Development of Public Employee Case Law

In *McAuliffee v. Mayor of New Bedford*, 155 Mass. 216, 29 N.E. 517 (1892), Justice Holmes ruled that public employees do not have any "right" to the benefit or employment but only a "privilege" that can be granted, withheld, or conditioned as the government chooses (Robinson et al. 1993, p. 626). Holmes stated that every person "may have a right to

talk politics" but he "has no constitutional right to be a policeman." An employee could not complain of such restrictions "as he takes his employment on the terms which are offered him" (Robinson et al. 1993, p. 626). The US Supreme Court upheld Holmes' reasoning that "the right to exclude all right to use necessarily includes the authority to determine under what circumstances such use may be availed of, as the greater power contains the lesser" (*Davis v. Commonwealth*, 167 U.S. 43, 48 (1897)).

The right-privilege concept was repeatedly repudiated in the 1950s and 1960s, especially in the context of restraints on the exercise of personal liberties such as free speech. The landmark decision of the US Supreme Court in *Pickering v. Board of Education*, 391 U.S. 563 (1968) drastically altered the right-privilege doctrine. Justice Marshall held that "absent proof of false statements knowingly or recklessly made by him," a public school teacher's exercise of speaking on an issue of public concern may not justify the basis for his dismissal from public employment (Robinson et al. 1993, p. 634). Following *Pickering*, in *U.S. Civil Service Comm'n v. Letter Carriers*, 413 U.S. 548 (1973); the Court majority agreed that Congress could limit the political activities of federal employees as long as they do not restrict a particular party, view point, or group of individuals in order to operate efficiently by minimizing political influence within the government. Moreover, in *Broadrick v. Oklahoma*, 413 U.S. 601 (1973), the Court upheld an Oklahoma statute which prohibited state employees from engaging in partisan political activities. *Broadrick* is often cited for a facial overbreadth test challenge that "the overbreadth of a statute must not only be real, but substantial as well, judged in relation to the statute's plainly legitimate sweep" (Robinson et al. 1993, p. 638).

In the seminal case *Elrod v.* Burns, 427 U.S. 347, (1976), a divided Court held that a nonpolicymaking public employee could not be dismissed solely on the basis of political affiliation. Elrod was the beginning of the eventual evisceration of the patronage system of nearly 200 years of American political tradition (Robinson et al. 1993, p. 643). Furthermore, in *Branti v. Finkel*, 445 U.S. 507 (1980) the US Supreme Court held that a public employee cannot be terminated solely based upon their political beliefs. A political party affiliation termination would undermine the effective performance of an assistant public defender's office to make their job security based upon their allegiance to the predominant political party rather than to their merit. The next landmark case was *Rutan v. Republican Party of Illinois*, 497 U.S. 62 (1990) in which the US Supreme Court ruled that the principle of *Elrod v. Burns* and *Branti v. Finkel*, involving public employee dismissals for patronage reasons, applies also to promotion, transfer, recall, and hiring decisions involving low-level public employees.

## Defining Due Process Rights for Public Employees

The current doctrine that the US Courts applies for determining whether a pretermination hearing process is sufficient or not is the *Matthews test*. The *Matthews v. Eldridge*, 424 U.S. 319 (1976) decision established three factors that are pivotal in determining what process is constitutionally required: (1) the importance of the private interest at stake to the individual; (2) the extent to which additional procedures are likely to result in a more reliable determination; and (3) the burdens additional protections would inflict on the government (Szypszak 2011, p. 56). The U.S Supreme Court also ruled that fairness does not always require an evidentiary hearing. The most important outcome of the case is that administrative agencies will have deference in determining the extent of due process.

A public employee's property right in employment does not derive directly from the US Constitution, but from state law. An employee may have a protected property right to continued public employment as a result of state academic tenure statutes. In *Slochower v. Board of Higher Education*, 350 U.S. 551 (1956), the US Supreme Court overturned a municipal law that required termination of employment for city employees who sought to invoke their privilege against self-incrimination in order to eschew responding to questions relating to their official duties. The Court concluded that had the law been forced, it

would have violated their right to due process because invoking the Fifth Amendment is not tantamount to admission of guilt.

The two seminal property interest cases was *Board of Regents v. Roth*, 408 U.S. 564 (1972) and *Perry v. Sindermann*, 408 U.S. 593 (1972). In the first case, the Court held that *Roth* had no property right interest in continued employment and therefore was not considered Fourteenth Amendment protection. *Roth* brought suit against the Wisconsin State University-Oshkosh asserting that the real reason for his nonretention was his criticism of the university administration violating his right to free speech protected by the Fourteenth Amendment; and the university's failure to inform him of the reason for its decision violated his right to procedural due process. Unlike Roth, Robert Sindermann taught for four successive years in the state college system of the State of Texas. When Sindermann's employment contract was terminated with no opportunity for a hearing to challenge the basis of the nonrenewal, he brought action in a federal district court alleging that the college administration infringed on his right to criticize the Board of Regents as freedom of speech and the Fourteenth Amendment's guarantee of procedural due process. The US Supreme Court ruled that while Odessa College did not have a formal tenure system, the possibility that the college having an "unwritten common law in practice" that would bestow "the equivalent of tenure" (*Perry v. Sindermann*, 408 U.S. 593 (1972)). Therefore, Sindermann was entitled to a hearing before the Board of Regents as well. The next case was significant for establishing a balancing test for ascertaining whether procedural due process has been satisfied or not prior to termination of Social Security disability benefit payments.

In *Codd v. Velger*, 424 U.S. 624 (1977), the US Supreme Court delineated the requirements for a hearing for a nontenured employee whom claims to be stigmatized in the course of a decision to terminate his employment. Velger sued the City Police Department for wrongful dismissal, arguing that he was improperly dismissed without a hearing or statement of reasons. He pursued a 42 U.S.C. Section 1983 reinstatement and damages for resulting injury to his reputation and future employment opportunities. The Court held for a hearing to be required there must be some factual dispute "which has some significant bearing on the employee's reputation." Velger never claimed that the attempted suicide report was false. The Court concluded there was not defamation since the allegation was not in the record and the facts were not in dispute.

In *Cleveland Board of Education v. Loudermill*, 470 U.S. 532 (1985), the US Supreme Court endorsed a constitutional due process requirement for statutory entitlements. The statute clearly demonstrated that respondents possessed property rights in continued employment. The Court found that a public employee dismissed only for cause was entitled to a very limited hearing prior to termination, to be followed by a more comprehensive post termination hearing. In other words, the employee must be given notice and an opportunity for hearing that is appropriate to the circumstances before deprivation of the property interest.

Twelve years after the *Loudermill* decision, the US Supreme Court unanimously ruled in *Gilbert* et al. *v. Homar*, 520 U.S. 924 (1997) that a presuspension hearing is not necessary to protect the rights of a tenured employee who is suspended without pay. This was the first time the Court considered whether the protections of Due Process extended to the discipline of tenured public employees short of termination. The *Matthews* test was applied in *Gilbert*. Unlike the *Loudermill* case, the respondent was confronted with only a temporary suspension without compensation. As long as the suspended employee receives a sufficiently prompt postsuspension hearing, the court held that the "lost income is relatively insubstantial" (*Gilbert* et al. *v. Homar*, 520 U.S. 924 (1997)). The majority opinion written by Justice Scalia balanced three factors significant to constitutional due process: first, the weight of the private interest of the accused; second, the probability of wrongfully depriving the private interest; third, the weight of the government's interest.

The *Matthews* analysis was also applied in *Walters v. National Association of Radiation Survivors*, 473 U.S. 305 (1985). The National Association of Radiation Survivors, a veterans group challenged the attorneys' fees provision, claiming

that it denied them the opportunity to acquire legal representation. The US Supreme Court held that the appellees neglected to demonstrate how the difference in success rates in adjudicating appeals before the Veterans Administration with counsel and the existence of complexity on some cases was sufficient to conclude that the right to retain and compensate an attorney was a necessary element of procedural fairness under the Constitution.

## Free Speech Rights of Public Employees

The current doctrine that the Courts apply when determining whether a public employee has a right to speak as a citizen on an issue of public concern is the *Pickering-Connick* balancing test. When a public employee speaks on an issue of public concern that is not associated with their official public duties, the Courts are inclined to rule on behalf of the employee. The public issue may be a fiscal issue that could cause the public some harm.

The first case that considered whether public employees have free speech rights was *McAuliffe v. Mayor of New Bedford* (155 Mass. 216, [1892]). The court interpreted the denial of a job due to political expression legally distinct from the direct denial of a right of expression. Many years later, the U.S. Supreme Court adopted a new prospective of the relationship between adverse employment action and off-duty conduct. In *Shelton v. Tucker* (364 U.S. 479 [1960]), the Court overturned an Arkansas law requiring as a condition of employment that schoolteachers submit an annual accounting of any organizations that they had belonged to or contributed to in the preceding 5 years. In a 5–4 decision, Justice Potter Stewart stated that the Arkansas law violated freedom of association under the First Amendment, which had been applied to the states through the due process clause of the Fourteenth Amendment.

A few years later, the Court established a precedent that is still applied currently regarding off-duty expression by public employees. In *Pickering v. Board of Education* (391 U.S. 563 [1968]), the US Supreme Court overturned the dismissal of a public school teacher who had written a letter to the editor of a local newspaper that was critical of the school board and school district administration.

In contrast to the *Pickering* ruling, in 1977, the US Supreme Court activity in *Mt. Healthy City Board of Education v. Doyle* (429 U.S. 274 [1977]) decided whether a school board could resist a First Amendment retaliation claim by proving that it would have made the same employment decision in the absence of a teacher's allegedly protected free speech. Justice William Rehnquist applied the *Pickering* test but found that the school board may have had legitimate reasons to terminate Doyle, regardless of his politically charged comments to a local radio station.

The case that demonstrated that even though speech may be a public concern, it may still not be fully protected under the First Amendment is *Connick v. Myers* (461 U.S. 138 [1983]). Although this opinion dealt with expression in the workplace, the precedent set in the case has been applied to controversies involving off-duty conduct. In a closely divided opinion, Justice Bryon White found when applying the *Pickering* test that Myers in general was not speaking about matters of public concern, because her questionnaire focused on internal office workings. Furthermore, White noted that Myers' questionnaire had the potential to hinder the efficient operation of the district attorney's office by questioning her superior's authority. Moreover, because Myers circulated the survey as a reaction to receiving an adverse assignment, White found that Connick had legitimate reasons to fire her. Since this ruling, most public employee free speech cases are now considered under the so-called *Pickering-Connick* test (*Waters v. Churchill* (511 U.S. 661 [1994])). This involves determining whether the employee was speaking on a matter of public concern, and whether free speech interests outweigh the interests in avoiding disruption in the delivery of public services.

In *Waters v. Churchill* (1994), a plurality of four Justices held that government workers cannot be dismissed or otherwise punished for their words unless the employer has a reasonable basis for believing that the speech was either

disruptive or that it involved a matter of purely private concern, outside the scope of the First Amendment's protection. Justice Sandra Day O'Connor stated in her plurality opinion that while a government agency or institution need not conduct a full-scale investigation, it must have some reasonable, factual basis for its punitive action.

In practice, the opinion's effect may be limited because many public employees work under contracts or Civil Service rules that give procedural protection against dismissal or discipline. Nevertheless, the *Churchill* case was probably the Court's most important ruling in more than a decade on the constitutional rights of government workers. Nonetheless, the US Supreme Court altered the direction of law in *Garcetti v. Ceballos*, 547 U.S. 410 (2006) and ruled that a public employee's right to privacy may be curtailed when it is a component of their official public duties.

The US Supreme Court ruled in a similar manner in *Lane v. Franks*, 134 S.Ct. 2369 (2014). Edward Lane sued Steve Franks under 42 U.S.-C. Section 1983, alleging that Franks had violated the First Amendment by firing Lane in retaliation for his testimony against Suzanna Schmitz. The US Supreme Court ruled that Lane's sworn testimony in a judicial proceeding was considered speech as a matter of public concern because it involved corruption in a public program and the misuse of state funds. Under the *Pickering* balancing test, the government employer failed to demonstrate any evidence that Lane's testimony was false or erroneous or that Lane needlessly disclosed any sensitive, confidential, or privileged information while testifying (*Lane v. Franks* 573 U.S. 13 [2014], p. 13).

## Restriction of Internet Access by Public Employees

In *Urofsky v. Gilomore*, 216 F.3d 401 (4th Cir. 2000), six faculty members in Virginia filed suit challenging the constitutionality of a Virginia statute that banned state employees from accessing lascivious, sexually explicit material on state computers unless authorized by a state agency (Va. Code Ann. 2.1–805). The plaintiffs claimed that the statute denied them the freedom to determine for themselves the topics about which they teach and engage in research. The Fourth Circuit held that the Virginia statute was neither unconstitutionally vague nor overbroad and thus did not infringe on the academic rights of faculty members. In addition, the Court utilized the *Pickering* test to find that *Urofsky* involved the speech of public employees in their workplaces rather than as private citizens concerning matters of public concern (Cloud 2010). Therefore, the Commonwealth of Virginia officials could determine the manner in which the faculty carried out their official duties.

The second claim of the faculty was that their academic freedom was a constitutional right as well as a professional norm. The Court cited the American Association of University Professors' (AAUP) definition of academic freedom as a right claimed by the accredited educator to interpret his findings and to communicate his conclusions without being subjected to any interference, molestation, or penalization because the conclusions are unacceptable to some constituted authority within or beyond the institution (*Urofsky v. Gilmore*, 216 F.3d 40, (4th Cir. 2000) p. 411). Nevertheless, the Court interpreted the AAUP's academic freedom concept as a professional norm to further the search for truth rather than a legal expression within the First Amendment. While dismissing the challenge to the statute, the Fourth Circuit concluded that academic freedom rights derive from universities and not from faculty members and students. *Urofsky* marked the beginning of a discourse on the freedom of speech and academic rights of faculty members in the Digital Age.

## Right of Privacy for Public Employees

The relevant doctrine that the US Courts utilizes when ascertaining the privacy rights of employees in the public sector is the reasonable suspicion standard. Reasonable suspicion is satisfied when two conditions exist: (1) the search is justified at

its inception, meaning that there are reasonable grounds for suspecting that the search will reveal evidence that the public employee has violated or is violating the law, and (2) the search is reasonably related in scope to the circumstances that justified the search, meaning that the measures used to conduct the search are reasonably related to the objectives of the search and that the search is not excessively intrusive in light of the person's age and sex and the nature of the offense (*New Jersey v. T.LO.*, 469 U.S. 325, (1985)). Although the legal standard for reasonable suspicion is straightforward, the application of it in different contexts is not always clear and coherent. The Court has even noted that "articulating precisely what reasonable suspicion means . . . is not possible. Reasonable suspicion is a commonsense, nontechnical conception that deals with the factual and practical considerations of everyday life on which reasonable and prudent men, not legal technicians, act" (*Ornelas v. United States*, 517 U.S. 690 (1996) p. 695).

In *Kelley v. Johnson*, 425 U.S. 238 (1976) the US Supreme Court ruled that the New York's Suffolk County Police Department regulation limiting the length of county policemen's hair did not violate the First or Fourteenth Amendments. The police department argued that uniformity of appearance contributed to officer safety and promoted the department's *esprit de corps*. Nevertheless, the respondent claimed that the police guidelines violated his right to free expression under the First Amendment and his substantive due process rights under the Fourteenth Amendment. The majority opinion held that state and federal employers could impose considerable restrictions on their employees that could not be imposed on private citizens. The respondent failed to demonstrate that the regulation was irrational enough to be considered arbitrary and unconstitutional. As a result, the Court now applies a balancing test to determine whether the government's conditions on public employment conflict with an individual's privacy rights.

The US Supreme Court next considered the question whether the right to privacy precludes the government from implementing a mandatory drug screening program for public employees? In *National Treasury Employees Union v. Von Raab*, 489 U.S. 656 (1989), the Court ruled that mandatory drug testing of federal customs employees is permissible, even in the absence of reasonable suspicion. The government's interest in curtailing rising drug abuse by implementing drug-free programs that ensure that government officials were mentally and physically fit weighed greater than their privacy rights. Moreover, the drug testing program had a close and substantial relation to the government's goal and that the regulation clearly informed the employee of the rationale and scope of the test. Since the duties of the Customs Service agents were typically hazardous and risky, officers were often the target of blackmail or bribery.

## The Fourth Amendment Search and Seizures of Public Employees

The prevailing legal doctrine in Fourth Amendment administrative searches is the special needs doctrine. This standard is based upon the concept that "special needs beyond the typical need for law enforcement, makes the warrant and probable cause requirements impractical" (*Griffin v. Wisconsin*, 483 U.S. 868 (1987), p. 873). On the one hand, if the objective of the search is not law enforcement purposes but for other reasons such as public safety or ensuring the integrity of sensitive government positions, then the doctrine will apply. However, if the "primary purpose" or "immediate objective" was "to generate evidence for law enforcement purposes," then application of the special needs doctrine is not appropriate, and the government must adhere to general Fourth Amendment principles (*Ferguson v. City of Charleston*, 532 U.S. 67 (2001), p. 83).

There has been a greater recognition of the claims of employers in the area of search and seizures. The federal Employee Polygraph Protection Act passed in 1998 permits polygraph tests to be used in connection with jobs in security and handling drugs or in investigating a specific crime. The Act only affects commercial businesses. Before being required to take a polygraph test as part of an investigation of an employment-related crime, one must be given a written notice,

at least 48 h prior to the test, stating that the person is a suspect. In addition, there must be a provable, reasonable suspicion that the person was involved in the specific crime or other conduct triggering the investigation. The statute does not cover federal, state, and local government agencies. Exceptions to the law are public water supply facilities and public transportation.

Although the balancing test have generated a tendency to weigh rulings in favor of supervisors, there is a nagging lack of predictability from case to case. This tendency first became apparent in the ruling of the Court in *O'Connor v. Ortega*, 480 U.S. 709 (1987). Hospital officials of Napa State Hospital had reasonable cause to enter and search an employee's private office for evidence of sexual harassment. The Court's majority stated that it was unreasonable to require an employer to obtain a warrant whenever the employer desired to enter an employee's office, desk, or file cabinets for a work-related purpose would gravely disrupt the routine conduct of business and would be "unduly burdensome" (Cooper 2005, p. 164). An administrative warrant can be granted if there is a showing that reasonable legislative or administrative standards for conducting an inspection are satisfied. While conducting a balancing test, the Court found that the public sector employee's privacy concerns are much less than those in their homes or other contexts. Therefore, public employers must be given the authority to enter employee offices for work-related, non-investigatory purposes.

The Court ruled differently in *Chandler v. Miller*, 520 U.S. 305 (1997) in which the State of Georgia enacted a statute in 1990 that mandated "each candidate seeking to qualify for nomination or election to a state office shall as a condition of such qualification be required to certify that such candidate has tested negative for illegal drugs" (Houser et al. 2008). The statute permitted candidates to present a certificate to the Secretary of States providing the results of a drug test taken within the previous 30 days. The Court's majority focused on the question whether the suspicion less searches were reasonable or not. To be considered reasonable under the Fourth Amendment, a search typically must be based on individualized suspicion of wrongdoing. But certain exceptions are permitted based on "special needs" concerns when the Court conducts a context-specific analysis to determine the competing claims purposed by the parties in the case. Since the State of Georgia provided no evidence of a drug problem among the state's elected officials and because they usually do not perform high-risk, safety-sensitive duties in which certification would enhance the interdiction effort, the Court's majority ruled for Chandler. Writing for the majority, Justice Ginsburg stated: "however, well-intentioned the candidate drug test diminishes personal privacy for a symbolic state commitment to defeat drug abuse in government" (Cooper 2005, p. 175).

## Antidiscrimination Case Law

In an equal protection analysis, the level of scrutiny review is dependent upon whether the US Courts determine the class to be suspect. The highest level of scrutiny is called strict scrutiny and is applied to government action that affects groups that are considered suspect classification. A class is considered suspect by the US Supreme Court if they meet the following criteria: First, the group has historically been discriminated against or have been subject to prejudice, hostility, or stigma, partially due to stereotypes. Second, the group possesses an immutable or highly visible trait. Third, they are powerless to protect themselves through the political process. Fourth, the group is a discrete and insular minority. Fifth, the group's distinguishing characteristic does inhibit it from contributing meaningfully to society. Furthermore, strict scrutiny requires that the suspect classification be narrowly tailored to accomplish a compelling governmental interest. When Courts interpret statutes under the standard of strict scrutiny, governments' typically fail to meet the rigorous standard of review. Strict scrutiny applies to racial classifications by local, state, and federal government. Strict scrutiny has also been applied to distinctions based on alienage, citizenship, and ethnicity. Although the US Supreme Court do not consider gender or sexual orientation as suspect

classifications for the purposes of strict scrutiny review, there are several state supreme courts that have been deemed them to be suspect classifications and subject to strict scrutiny.

Both Title VII of the Civil Rights Act of 1964 and Administrative Procedures Act (APA) prohibits discrimination in employment decisions. One of the earliest US Supreme Court decisions that sought to clearly delineate the standards for proving discrimination was in *Washington v. Davis*, 426 U.S. 229 (1976). While not irrelevant, the Court majority's found that disproportionate impact alone does not trigger the rule that racial classifications are subject to the strict scrutiny standard of review. The law enforcement's efforts to recruit black police officers are evidence that the police department did not intentionally discriminate on the basis of race. The standardized test was rationally related to the legitimate government purpose of confirming that police officers have acquired a particular level of verbal and reading skills. According to the *Davis* decision, whenever a court considers a law with a disproportionate effect on a racial minority, it must first determine if the law is race specific or not before proceeding with a particular standard of review.

The US Supreme Court established a sexual harassment in the workplace standard for the responsibilities of employers in damages and those litigants who seek a redress of their grievances in *Faragher v. City of Boca Raton*, 524 U.S. 775 (1998). Beth Ann Faragher, a lifeguard for the City of Boca Raton, quit her job and filed a lawsuit for violations of Title VII of the Civil Rights Act of 1964 and sought damages from the city for her supervisors "uninvited and offensive touching," lewd language, and sexist comments (Cooper 2005, p. 184). The Court held that the city was vicariously liable under Title VII for actionable discrimination caused by the supervisor. Moreover, the liability in question is subject to an "affirmative defense" when scrutinizing the reasonableness of the employer's conduct as well as the plaintiff. The District Court found that the "City had entirely failed to disseminate its sexual harassment policy among the beach employees and that its officials made no attempt to keep track of the conduct of supervisors, and the record makes clear that the City's policy did not include any harassing supervisors assurance that could be bypassed in registering complaints." As a result, the US Supreme Court ruled that the City could not be found to have exercised "reasonable care to prevent the supervisors' harassing conduct" (*Faragher v. City of Boca Raton*, 524 U.S. 775 (1998), p. 4). The Court indicated that affirmative defenses have two elements: (1) employers must have exercised reasonable care to prevent and promptly correct any sexually harassing behavior, and (2) victimized employees unreasonably failed to take advantage of any preventive or corrective opportunities provided by the employer (Dagley 2008). These affirmative defenses are unavailable when the harassment ends in tangible, adverse job-related actions, including demotions and discharges (Dagley 2008).

## Liability, Immunity, and Remedies for Public Sector Employees

The predominant legal standard in immunity law is the sovereign immunity doctrine. Sovereign immunity is a Court imposed doctrine that prevents the government or its political subdivisions, departments, and agencies from being sued without its consent. The doctrine derives from the English principle that the monarch can do no wrong. Sovereign immunity applies to liability for monetary damages to be paid from public funds. Public officials also may be protected from personal tort liability on the basis of the doctrine of a public duty. The doctrine was established in common law to protect local governments and their employees from liability for failure to provide police protection based on the unreasonableness of expecting law enforcement to prevent all harms. Qualified immunity is designed to protect public officials from actions that unknowingly violated clearly established statutory or constitutional rights. Typically, courts apply sovereign immunity to suits against public officials personally for their discretionary acts. However, this immunity does not apply to ministerial acts that involve no discretion. Government

waives its immunity from liability when it authorizes a damage claim. In order to bring about uniformity, Congress codified the conditions under which immunity would be waived when it enacted the first major tort claim authorization with the Federal Tort Claims Act (FTCA) of 1946.

Since the *DeShaney v. Winnebago County Department of Social Services*, 489 U.S. 189 (1989) decision, the US Supreme Court have made it more difficult for people injured by the negligence of state agencies to litigate against the government through the due process clause. Moreover, the *Castle Rock v. Gonzales*, 545 U.S. 748 (2005) ruling made it extremely difficult for a citizen to file a law suit for any infringement of property rights when the government acts adversely to their interests. Both cases lead inescapably to the conclusion that under current law, government agencies have less tort liability than private individuals, corporations, or other non-governmental actors (Harrington and Carter 2015, pp. 382–383).

Since 2000, the US Supreme Court have demonstrated a tendency toward federalism to defer to the rights of states to develop their own laws and policies regarding limits to public employees who have suffered discrimination from accessing federal law to redress their claims. In *Kimel v. Florida*, 528 U.S. 62 (2000) a divided Court ruled that the sovereign immunity of the states prevents Congress from mandating that states pay damages for violations of the Age Discrimination in Employment Act. The majority stated that the monetary damages awarded were not proportional to the alleged claim. Furthermore, the Court suggested that "age" is not a suspect category like race, and therefore may only be subject to the rational basis test. Which permits states to put forth a rational argument for age discrimination, they cannot be held liable under federal laws.

The next year, the Court used the same analysis in *Board of Trustees of the University of Alabama v. Garrett*, 531 U.S. 356 (2001) to the extent of states' liability in cases of discrimination on the basis of disability. Garrett had a disability according to the Americans with Disability Act (ADA) and sought monetary damages from the University of Alabama for violation of Section I of the ADA. The University of Alabama asserted that the Eleventh Amendment prevented Congress from imposing monetary damages on states. In a closely divided opinion, the Court's majority held that there must be an unambiguous pattern of state discrimination against disabled people in order to promulgate monetary damages under the ADA. Moreover, the Court claimed that the remedies sought must be proportional with the specific violation. Chief Justice Rehnquist cited the *Kimel* precedent to assert that certain practices of discrimination by states against the disabled should be subjected to a rational relationship test.

As a result of the ruling in *Nevada Department of Human Resources v. Hibbs*, 538 U.S. 721 (2003), state employees may recover monetary damages in federal court when a State fails to comply with the Family Medical Leave Act's (FMLA) family-care provisions. The Court's majority reasoned that Congress may revoke the States' Eleventh Amendment immunity from suit in federal court if it unambiguously intents to in the statute and acts according to Section 5 of the Fourteenth Amendment. When Congress enacted the FMLA, there had been evidence of an extensive history of sex discrimination regarding leave benefits by the States, which was significant enough to justify Section 5 legislation. The *Hibbs* ruling have allowed 4.8 million state employees to legal remedies nearly equal to those of their private sector counterparts (Tibben 2004, p. 600).

## Conclusion

The US Courts have been instrumental in providing administrative remedies to both supervisors and employees in the public sector. In regards to patronage employment decisions, the US Supreme Court have protected nonpolicymaking public employees from dismissal solely on the basis of partisanship. In later cases, this principle was extended to promotion, transfer, recall, and hiring decisions involving nondiscretionary positions. In other areas of public employment law, procedural due process safeguards have been clearly enunciated by the Courts to ensure fairness when administrating adverse employment procedures. Nevertheless, the US Courts have been somewhat inconsistent and incoherent in the

demarcation of the rights of employees in the public system. The extent of free speech rights for public employees has been determined in most cases by the *Pickering-Connick* balancing test. If a public employee serves in law enforcement capacity, the Courts have tended to rule on behalf of the police agencies' need for an *esprit de corps* that produces an efficient delivery of public services. Alternatively, when a public employee speaks on an issue of public concern that is not associated with their official public duties, the Courts are inclined to rule on behalf of the employee.

The US Courts have had a profound affect in promulgating Title VII of the Civil Rights Act of 1964 prohibition of discrimination in employment and workplace. The US Supreme Court have ruled against state immunity concerns in favor of public employee monetary damages in both sexual harassment and FMLA cases. In contrast, the US Supreme Court in several cases have decided in favor of the states' sovereign immunity from lawsuits filed by state employees. In regards to the Fourth Amendment, the US Supreme Court ruled that employers have the authority to enter employee offices for work-related, non--investigatory purposes. The US Courts have decided that faculty employed in public colleges and universities do not have a constitutional right to Internet access for academic purposes. In regards to sovereign immunity, the US Supreme Court have protected states' but not necessarily the federal government employees from monetary damage lawsuits. The US Supreme Court have also been helpful to both litigants and governmental agencies with the establishment of an affirmative defense standard to guide judges in sexual harassment cases. Since US Courts make common law decisions on a case-by-case basis within a society that is under constant change due to scientific and technological advancements, there may never be consistent and precise boundaries to public employee rights.

Employee work morale; Employee work motives; Employee work motivators; Incentives for employees

## Introduction

The purpose of this chapter is to introduce basic definitions, measurements, theories, and related concepts of work motivation. As readers of this

book are mainly those who plan to map a career in the public sector, this chapter also includes themes particularly related to public administration such as public sector motivation, public service motivation, and motivation crowding effect.

## What Is Work Motivation?

As Rainey (2009) indicates, everyone has an intuitive grasp of motivation, but it remains a concept that is often poorly defined. Over 140 definitions have been offered in the last couple of decades (Landy and Becker 1987). For example, work motivation can refer to "a person's desire to work hard and work well" (Rainey 2009, p. 248). It can also mean "psychological forces within a person that determine the direction of the person's behavior in an organization, effort level, and persistence in the face of obstacles" (George and Jones 2012, p. 183). The two definitions have different foci: the first definition concerns the **overall levels of desire** to work hard, whereas the second one emphasizes **psychological forces** that lead to a hardworking behavior. Various theories and measurement instruments have been developed based on different meanings and definitions of work motivation.

### Work Motivation as a Person's Desire to Work Hard

Researchers are often baffled when they try to capture the desire to work hard: Is the desire to work hard the same as a hardworking behavior? Should we consider one's propensity, attitude, or real behavior? In fact, when measuring work motivation, scholars often include all these factors. For example, Patchen et al. (1965) ask "On most days on your job, how often does time seem to drag for you?", which questions the respondent's attitude, and "How often do you do extra work for your job that isn't really required of you?", which questions the respondent's real behavior. Others employ affirmative statements like "I put my best effort to get the job done regardless of the difficulties" and "I am willing to start work early or stay late to finish a job" to measure various aspects of work motivation (Chen and Bozeman 2013; Wright 2004).

Although scholars claim that the constructs are valid, it is very likely that respondents overestimate their work effort and the willingness to work hard. Few may want to admit that they are indolent workers, so in general the ratings are inflated. In this, scholars suggest the use of "observations about coworkers' motivation" (Landy and Guion 1970). This may effectively rectify the problem of self-reporting, but data collection will be a long and inefficient process. That may explain why thus far this method is underemployed.

Perhaps due to measurement difficulty, scholars use several proxy concepts to capture whether employees are well motivated. The most commonly used motivation-related concepts are job involvement, job satisfaction, and organizational commitment (Moynihan and Pandey 2007a). While these attitudinal variables are convenient to measure, they may not fully reflect how much one is motivated. For example, it is likely that a public servant is very satisfied with his job condition and loyal to his agency, but still be unwilling to work extra hours. Scholars are urged to be cautious when they apply these concepts in motivation research.

### Work Motivation as Psychological Forces That Lead to a Hardworking Behavior

Psychological forces reside in persons. There are basically two types of psychological forces: **intrinsic and extrinsic**. Behavior derived from intrinsic motivation is performed for its own sake, and people who perform the behavior often enjoy it, experience a sense of achievement, and consider that they have done something meaningful. Behavior driven by extrinsic motivation is performed for purposes external to individuals such as obtaining monetary rewards and praises, or avoiding penalties. The intrinsic-extrinsic dichotomy is a popular motivational typology in the research of organizational behavior (OB), perhaps because of its simplicity. For example:

- In Herzberg's (1966) two-factor theory, all hygiene factors are extrinsic (e.g., salary,

working conditions, etc.), whereas motivators are in general intrinsic (e.g., growth, the work itself, etc.) in nature.

- Lawler (1971) uses "extrinsic rewards" to refer to job situations given by others and "intrinsic rewards" to stand for higher-level need satisfaction in Maslow's (1954) hierarchy of needs such as self-esteem and self-actualization.

Readers are reminded that intrinsic motivation and extrinsic motivation do not have to be mutually exclusive. Sometimes people can be motivated both intrinsically and extrinsically at the same time. While the intrinsic-extrinsic dichotomy provides a convenient means of classifying motivation factors and analyzing their impact on behavior, it oversimplifies the complex structure of motivation. For example, pursuing promotion and avoiding supervisor's blame are both extrinsic motivators at work, but we usually expect that pursuing promotion accompanies more work effort and higher performance. The motivational typology in **self-determination theory (SDT)** (Ryan and Deci 2000), which goes beyond intrinsic-extrinsic dichotomy, offers researchers a more comprehensive view of human motivation.

## Four Types of Work Motivation in Self-Determination Theory (SDT)

The most distinctive feature of SDT is its careful analysis of extrinsic motivation. There are three types of extrinsic motivation, as shown in Fig. 1. On the very left of the spectrum is external regulation, the first type of extrinsic motivation. *External regulation* means that people behave to satisfy an external demand such as avoiding physical punishment or obtaining an external reward contingency (Vallerand and Ratelle 2004). For example, a student studies math because his teacher punishes him when he fails to do well or because his parents give him money when he gets a good grade. Regarding work motivation, it refers to when one works to obtain financial reward and job security, or to avoid criticism (Gagné et al. 2015; Tremblay et al. 2009).

Next to external regulation is *introjected regulation*. People who fall into this category perform an action not to avoid physical penalty, but instead, intangible and self-created pressure such as anxiety and shame. For example, without external punishment or reward, a student may still choose to make a serious effort to study math because he feels ashamed and anxious if he performs worse than his classmates. Regarding work motivation, it concerns whether "I don't want to lose" or "I want to prove I can" propels workers to make efforts (Hwang et al. 2002). Both external regulation and introjected regulation are typical **controlled motivations** as individuals fail to perceive a sense of autonomy when they act. When people are regulated in these two cases, their self-determination is weak, and they do not believe that they have full control over their behavioral consequences; that is, the locus of control concerning that behavior is external to them.

Not all extrinsic motivators create a sense of being controlled. *Identified regulation*, the one next to introjected regulation, means that

**Employee Work Motivation, Fig. 1** Motivational typology in self-determination theory (SDT)

individuals choose to be regulated for a positive identified value. For example, a student studies math hard because math, in his mind, is a valuable and useful subject as he plans to map his career in engineering. As becoming an engineer is identified as an extrinsic but valuable goal, the student may not feel controlled when he studies math. In other words, his action is not forced; it is produced by an intrinsic desire to achieve an extrinsic goal. At work, identified regulation concerns whether one accepts a job due to the chances for advancement, career development, and higher social status (Gagné et al. 2010).

The last type of motivation is intrinsic motivation, which signifies *internal regulation* when one performs an action. An intrinsically motivated worker feels excited and happy whenever she works, and working is in itself a reward to her. People who are intrinsically motivated also demonstrate a strong internal locus of control (Spector 1988), meaning that they are not only an active causal maker but are also in full control over their behavioral consequences. Identified regulation and intrinsic motivation are thus considered as **autonomous motivations**.

Although the coexistence of autonomous motivation and controlled motivation is not entirely impossible, theoretically speaking, the increase of controlled motivation often accompanies the decrease of autonomous motivation. In addition, human motivation evolves over time, depending on whether employees perceive that their three most important psychological needs are met. When needs are met, internalization happens, meaning that autonomous motivation gradually exceeds controlled motivation. The three needs are autonomy, competence, and relatedness (Broeck et al. 2010):

- Autonomy: Individuals experience a sense of choice and psychological freedom when they perform an activity. For example, employees feel free from rigid rules and other people's commands.
- Competence: Individuals feel that they are able to handle problems in their job. For example, employees perceive that they have enough knowledge and skills to do their job well.
- Relatedness: Individuals feel that they are psychologically connected to important others. For example, employees feel that they are not alone and are well respected in their everyday job.

## Work Motivation and Public Administration

### Poorer Overall Work Motivation in the Public Sector

Public administration scholars have conducted several public-private comparison studies and concluded that public and private organizations indeed differ in environments and employee work attitudes (Boyne 2002; Rainey and Bozeman 2000). Public organizations are confronted with a greater measure of red tape, political interference, hierarchical control, and goal ambiguity. These features can destroy employees' overall work motivation and compromise their sense of job involvement, job satisfaction, and organizational commitment (Buchanan 1975; Chen 2012).

### The Concept of "Public Sector Motivation"

The unique environment of public organizations does not only affect employees' overall levels of work morale and attitudes; it also influences various autonomous and controlled work motivations. For example, the presence of merit protection along with a high level of job security in the public sector attracts those who long for a stable career. A lack of monetary reward such as performance bonus may deter those who covet high pay from accepting a public service job. Public sector employees' special "wants" or "needs" are referred to as **public sector motivation** (Gabris and Simo 1995).

A huge volume of empirical studies have been done to discover public sector motivation (Buelens and Van den Broeck 2007; Jurkiewicz et al. 1998; Khojasteh 1993; Lyons et al. 2006; Wittmer 1991). The approach taken to conduct such research is simple: listing multiple items of human needs (e.g., security, benefits, salary, advancement, helping, growth, prestige,

interesting work, etc.), asking both public and private employees to place a value/rank on each item, and comparing public-private differences. In general, scholars reach the following conclusions:

- In both the public and private sectors, the Top 5 needs are very similar, although the ranking of these needs differ slightly in the two respective sectors. The Top 5 needs are security, pay, advancement, achievement, and work content.
- Compared to enterprise workers, public employees have less desire for prestige, money, and advancement.
- Compared to enterprise workers, public employees show a greater need for security, a stable career, and fringe benefits. They also care more about challenging and intellectually stimulating work content.
- Finally, compared to enterprise workers, public employees demonstrate a stronger desire to benefit the society. Scholars further develop this feature and create a new concept called **public service motivation (PSM)**. Readers are reminded here that PSM does not refer to public sector motivation.

### The Concept of "Public Service Motivation" (PSM)

As mentioned, the research of PSM starts with public-private comparison on employee motivation. The simple finding that "public employees are more likely than their business peers to be motivated by prosocial factors" was expanded both conceptually and empirically by Perry and Wise (1990). They define PSM as "an individual's predisposition to respond to motives grounded primarily or uniquely in public institutions and organizations" and argue that PSM has three distinctive categories: rational, norm based, and affective. Following this pioneer study, Perry (1996) developed the first PSM measurement instrument which consists of the following four dimensions: attraction to policy making, commitment to the public interest, compassion, and self-sacrifice. The plethora of PSM research in recent decades is mainly grounded in these two early studies. According to a recent review article (Perry et al. 2010) and most recent evidence, scholars have obtained the following findings:

- PSM determines one's sector selection. The greater an individual's PSM, the more likely the individual seeks jobs in public organizations.
- PSM is positively related to individual performance, especially in the public sector. PSM is negatively correlated with a desire for money, so public organizations that attract many high-PSM people are less dependent upon monetary incentives.
- PSM is unlikely to be a type of controlled motivation. It should be autonomous in nature (Vandenabeele 2007).
- PSM is not entirely good. It is a double-edged sword. High-PSM people are more likely than low-PSM people to be frustrated by unfriendly public sector features such as red tape and hierarchical control (Steen and Rutgers 2011).

The rapid increase of PSM research is accompanied by a few challenges (Bozeman and Su 2015). First, although PSM was initially defined as motives grounded "uniquely in public organizations," it is hard to deny that nonpublic servants (e.g., nonprofit employees) can be high-PSM individuals, if PSM refers to compassion and self-sacrifice. Therefore, scholars have broadened the scope of PSM by making it a general prosocial or altruistic motivation, but this makes PSM a less distinctive concept. In addition, motivation is the reason that individuals choose to perform a certain action. However, PSM exists without a clear public service behavior, making PSM more like attitudes or values, not motivation. For example, a low-level public servant may be eager to serve people in her daily work, but "attraction to policy making" is unlikely to be a major motivator. Despite these theoretical challenges, PSM remains one of the scholars' favorite topics.

### PSM and Motivation Crowding Effect

Research on PSM is inseparable from motivation crowding theory. Motivation crowding effect (Frey and Jegen 2001) refers to a situation where one's intrinsic motivation, or autonomous motivation, can be affected after one experiences

external inducements. For example, a student loves math and she thinks that math is valuable for her future. One day, the teacher creates a new policy: monetary reward of $500 when her score exceeds 90, but punishment when her score is lower than 70. Eventually, this student may forget the value of math and lose the happiness in studying the subject and instead perceive that she is controlled by external forces (monetary incentive or avoidance of punishment). The phenomenon that autonomous motivation decreases (and controlled motivation increases) after the introduction of external inducements is called **motivation crowding-out effect**.

Scholars argue that the increase of external interventions such as red tape and hierarchical control can undermine PSM (Moynihan and Pandey 2007b). Monetary rewards such as performance-based pay, in many cases, can crowd out PSM as well (Langbein 2010). However, it should be noted that money and PSM are not always incompatible. **Motivation crowding-in effect** can appear when individuals perceive monetary reward as a type of support instead of control. For example, an entry-level public employee needs a substantial sum of money to support his ailing mother's medical expenses. When he receives a huge performance bonus, he does not need to worry about paying for the expenses. Monetary reward in this case may not reduce his PSM. Instead, it increases his public servant identity and fosters his PSM.

Both motivation internalization in SDT and motivation crowding effect remind scholars and managers that motivations are not static. Autonomous motivation overpowers controlled motivation today, but controlled motivation can prevail over autonomous motivation tomorrow. One can be fully motivated today, but can entirely lose motivation the next day. Therefore, understanding the process of motivation is as important as understanding the types of motivation.

## Process Perspectives of Work Motivation

Process perspectives concern how the motivational process works. Process perspectives reviewed in this section include expectancy theory, equity theory, goal setting, and job design.

### Expectancy Theory

Expectancy theory (Vroom 1964) addresses two questions. Firstly, do individuals believe that their work effort will result in a given level of performance (expectancy)? Secondly, do individuals believe that their performance will lead to the attainment of desired outcomes such as pay, security, and a feeling of accomplishment (instrumentality)? Individuals will not be motivated until they answer "yes" to the two questions. In addition, valence must be high enough to motivate people. The magnitude of valence is measured by how desirable an outcome is for employees. For example, everyone needs a paycheck, but magnitude of valence is much higher for those who have a pressing need for money. Nonetheless, research limitation exists. It is never easy to list all possible outcomes important to people and to measure the valence.

### Equity Theory

This theory was first proposed by Adams (1965). Equity theory is well grounded in the concept of social comparison (Festinger 1954). Social comparison theory assumes that humans have a basic drive to evaluate their opinions and abilities. In the absence of objective, nonsocial means, people evaluate their opinions and abilities by comparing themselves with others. At work, individuals often compare the outcome/input (especially pay/effort) ratio with others. After making comparison, feelings of inequity may appear. In the case of underpayment, individuals may take the following measures to restore equity (Adams 1963):

- They try to change the inputs (reducing effort) or outcomes (asking for raise).
- They try to change referents' inputs or outcomes (complaining to the supervisor).
- They change their perceptions of inputs and outcomes (hypnotizing themselves that their job is more difficult than that of the referents).
- They change referents or leave the organization (quitting comparison).

Compared to their private sector peers, public employees in general perceive a lower level of pay equity. Internally, when public employees compare themselves with colleagues in the same agency, they face ambiguous organization goals and vague indicators for performance measurement. Employees are very likely to feel that their hard work is not commensurate with salary. Moreover, the lack of performance bonus in the public sector may compound feelings of inequity, especially when compared to the business sector.

### Goal Setting

Two kinds of goals are especially motivating: specific goals and difficult goals (Locke and Latham 1990). Why so? Scholars contend that these goals (i) direct employees' attention and action toward goal-relevant activities, (ii) cause employees to put forth more effort, (iii) cause employees to create an action plan to achieve the goals, and (iv) cause employees to be persistent when facing obstacles (George and Jones 2012).

However, difficult goals can be detrimental if there is no clear communication between goal designers (managers) and employees. It is not hard to imagine that difficult goals without constant instruction and feedback can discourage employees. In addition, difficult goals are more suitable for employees with high self-efficacy, which is the belief that individuals can successfully perform a behavior. Difficult goals are, however, unsuitable for employees who lack adequate skills/knowledge and who need full attention for learning.

One last important point is that goal setting can be incompatible with work that requires a high level of creativity. Goals come with performance measurement, but creativity can hardly be measured with quantifiable indicators. A typical example is scientific research: once researchers are required to produce a certain number of publications within a short period of time, they usually sacrifice the novelty of research and choose topics that can be replicated easily or topics that require minor incremental improvement.

### Job Design

Scientific management assumes that job simplification and job specification (e.g., subway workers) can maximize productivity, but job monotony can demotivate people. More recent perspectives that remedy the problem presented by scientific management are job enlargement and job enrichment. *Job enlargement* involves increasing the number of tasks, but keeping tasks at the same level of difficulty. *Job enrichment* involves designing jobs that facilitate employees' self-improvement and growth. For example, managers can allow employees to decide their own work schedules, decide how to get job done, and learn new skills (George and Jones 2012).

The job characteristics model further endorses the concept of job enlargement and enrichment. There are five dimensions in this model (Hackman and Oldham 1975): skill variety, task identity, task significance, autonomy, and feedback. If we use self-determination theory to understand this model, we may find that the first three dimensions can improve a person's perceived competence, and feedback fosters one's perceived relatedness. Therefore, these characteristics can eventually enhance employees' intrinsic motivation.

## Research Tips for Young Public Administration Scholars

Work motivation has long been one of the most important topics in public administration research. Empirical findings show that public employees, compared to their business sector counterparts, have a lower level of work morale. In addition, factors that motivate public and private sector employees are not entirely identical. Among all differences, the chance to serve the public interest attracts the greatest attention. Grounded in these findings, some directions are offered to young public administration scholars for future research.

Self-determination theory (SDT), despite its maturity, has not appeared frequently in the public administration literature. More prevalent use of SDT should be encouraged. Scholars may first consider integrating SDT with PSM.

Contemporary public administration literature assumes that PSM is autonomous in nature and it should be altruistic. However, a public service behavior does not have to be always motivated by purely altruistic reasons, and individuals may not feel autonomous when they serve people. For example, a high-level public official works very hard to make public policies, yet it is not because he loves it or thinks it is valuable, but because he is afraid that media may come after him and the agency. It is also possible that he does not want to look inferior (like a loser) when he faces his private sector friends. The "selfish" motivations for public service are left underexplored in contemporary PSM research, but SDT can well capture these introjected and external regulatory styles.

Following this line of research, scholars can even incorporate the three most important needs in SDT, autonomy, relatedness, and competence, into analysis. Regarding autonomy, scholars can investigate whether red tape, hierarchical control, political interference, and performance pay increase employees' controlled motivation for public service. They can also explore whether mentoring, formal training, and job rotation enhance employees' perceived competence and accordingly promote their autonomous motivation for public service. Finally, regarding relatedness, it will be interesting to study the impact of oral praise on work motivation and have it compared with the effect of instrumental incentives such as money and advancement. Relatedness can also refer to the relationship between public servants and citizens. Testing whether cynicism undermines public servants' work motivation can be an interesting topic.

# Employee-Friendly Practices: Fashionable, Flexible, and Fickle

Lina Vyas
The Education University of Hong Kong, Hong Kong Institute of Education, Hong Kong, China

## Synonyms

Employee-friendly policies; Family-friendly arrangements; Family-friendly employment practices; Family-friendly policies; Flexible working practices

## Definition

Employee-friendly practices refer to formal or informal terms and conditions that exceed the statutory minimum, designed to enable an employee to combine caring responsibilities with paid employment.

## Introduction

The world is aging rapidly. According to the United Nations Population Fund, people aged 60 and older make up 12.3% of the global population, and by 2050, that number is expected to rise to about 22%. Demographic aging as a global phenomenon is posing social and economic challenges to the global economy and the working population worldwide. To mitigate the impacts of aging on the labor force, some jurisdictions such as the United States, the United Kingdom, and Japan have been boosting the labor force participation rate by getting more individuals to join the workforce, including homemakers. Sometimes, it is achieved through offering financial incentives to married women or their families such as tax schedules favorable to dual-earner couples or nonfinancial ones such as family leave and subsidized day care service.

Not only are women more likely to work in the labor force because of the aging population, but they are also earning much more than men are, compared to the employment situation 40 years ago. With women's higher education levels, employment opportunities, and earnings, the social landscape and gender role expectations are changing. Women's contributions to family income are so essential that in nearly four in ten families, married women are primary breadwinners, making as much or more than their spouse or doing it all by themselves. Recent reports as the ones published by the Center for American Progress and the Pew Research Center have consistently found that a record 40% of all families with children under the age of 18 are composed of mothers who are either the sole or main source of income for the family, whereas the share was merely 11% in 1960. Such findings indicate that women are being increasingly relied on for their economic well-being, and their contribution to family income particularly in married-couple families has served to boost family income. An increase in women's earning capacity, nevertheless, has fueled significant tension among working parents in demand for resources from two competing domains, resulting in work-family conflict. In some findings, almost half of the men and women have reported that their jobs have affected their family life so much that their task performance and job dissatisfaction have declined, resulting in less discretionary behavior benefitting the organization and the supervisor. Work-family conflict refers to simultaneous pressures from the work and family domains which are mutually incompatible in some respect, such that meeting the demands of one role (e.g., family care) makes it difficult to meet the demands of the other (e.g., career) (Greenhaus and Singh 2003). One of the reasons attributing to increasing work-family conflict is, in spite of the fact that many families now have dual-income earners, the majority of household responsibilities including caregiving and housework still fall on women. Previous research has found that married women, particularly those working long hours, are more likely to experience work-family conflict than their male counterparts do and that women tend to experience more work-to-family depletion and less segmentation between work and family concerns.

## Employee-Friendly Policies and Practices

Considering the growing number of women in the labor market and intensifying work-family conflict, some family-friendly policies and practices have been widely practiced in developed countries such as the United States, Canada, and Australia for both workers and the economy to address the dual demands of caring for family members while working to meet basic needs: alternative work arrangements that offer variations from the standard workday, workweek, and/or work location; flexible work schedules or flexitime or reduced schedules (part-time) that allow workers to choose their starting and finishing times daily, provided they complete a stipulated number of hours; compressed workweeks that offer employees the flexibility to work the equivalent of a full-time week in fewer than 5 days; partial work years that allow workers to work less than 12-month calendar year; and telecommuting that lets employees work at home

or at a local telework center 1 or more days per week using communication tools including phone, fax, Internet teleconferencing, or e-mail to perform work duties from a remote location. They are all areas in which policies can be expanded to bolster employees' ability to control the timing of their workdays, their workweeks, and their workplaces, hence reducing the conflict between work and family, particularly for single parents. Many empirical studies including the survey conducted by the United Nations among its Secretariat staff in 2009 has confirmed that greater access to employee-friendly policies has been proven to be associated with better mental health and resilience, higher productivity and effectiveness, greater levels of job satisfaction, stronger job commitment, greater employee engagement (an emotional and intellectual connection that employees have for their jobs and organizations, which in turn influences them to apply additional discretionary effort to their work, as in Gibbons (2006)), lower turnover intention, lower levels of work-family interference, and better work-life reconciliation.

## Supervisor Support

When formal support from an organization is low, employees who experience the most work-family conflict (thus, who have the greatest need for family support from supervisors) are more likely to notice, appreciate, and favor the family support provided by their supervisors. As a matter of fact, supervisors serve as effective mediators and primary implementers of work and family policies initiated by various organizations. Given the prominence of work-family issues among employees today, having a supportive supervisor is a characteristic of effective employee-friendly workplaces. The current literature has highlighted that employee-friendly arrangements and workplace interventions (such as alternative work arrangements and perceived workplace flexibility) should be implemented alongside supervisor support to achieve the desired results because alternative work arrangements do not provide a buffering impact on the association between demands and strain. In addition, supervisors have position power over their employees; hence, their support will be more effective in reducing stressors and improving outcomes for employees. A number of empirical studies such as the ones conducted by Marcelissen et al. (1988) and Ng and Sorensen (2008) have documented evidence that supervisor support is effective in reducing stressors such as role overload, role ambiguity, role conflict, and job uncertainty for employees, particularly manual laborers who more likely need supervisory instructions to perform their jobs successfully, and enhancing supervisor support can mitigate the degree of work-family conflict that employees experience and the consequences of such conflicts.

Many researchers have categorized supervisor support into two: emotional support (e.g., expressing concern in helping employees get the job done, informing employees about corporate policies such as alternative work arrangements and personal leave days) and instrumental support (e.g., offering tangible assistance to employees to support them through work-life challenges or ease stressors). Supportive supervisor behaviors include making it easier for employees to balance work and nonwork obligations by allowing schedules to be rearranged and flexible work arrangements to be used, responding positively to discussing and accommodating employees' family obligations, being flexible by allowing them to leave work early at the time of family-related challenges, being open to hearing their family-related issues, modeling a sense of work-life balance in their own lives, and not penalizing those who value work-life balance. In gist, supervisor support means supervisor flexibility and supervisor sensitivity.

## Situations in the United States, Germany, and Hong Kong

In this section, we are to examine the situations in the United States and Germany, where family-friendly policies are protected by law, and then in Hong Kong where introduction of family-friendly policies is not a legal requirement.

In the United States, women make up half of all workers in the country, while women were one-third of the workers in the nation, and only over a quarter were breadwinners or co-breadwinners in their families back in the late 1960s. Like the married women in other jurisdictions, American wives in husband primary-earner families contributed 24% of family income, while wives in wife primary-earner families contributed 67% of family income, according to a research conducted in 2010 and 2013 by the Carsey School of Public Policy of the University of New Hampshire (Smith 2015) on married and single women's contributions to family income. Despite the greater reliance on women's earnings among American families, industries that typically employ women such as the service, health, and education sectors are offering wages and benefits that are too low to support a family. However, unlike many European countries, the United States has few federal policies for working parents. One is the Family and Medical Leave Act of 1993 which offers employees at businesses of a certain size with 12 weeks of unpaid leave. In view of the increasing importance of married women's contribution to the economy, the US Congress has engaged in proposing other employee-friendly reforms including introducing legislation on workplace flexibility, with various states such as San Francisco, Washington, D.C., New Jersey, and Rhode Island enacting paid family leave through employee payroll taxes. Nevertheless, an appetite remains among the Americans for the federal government, the businesses, and the media to address the social changes. A poll commissioned by the Center for American Progress (Boushey and O'Leary 2010) has found that overwhelming majorities of the interviewees agreed the federal government and businesses should adapt the changes by providing flexible work schedules, better childcare, and paid family and medical leave.

In Germany where the birth rate is one of the lowest in the world, family-friendly policies are made a statutory requirement. The maternity protection laws were enacted to protect the mother and her child before and after birth and to provide financial security. The law encompasses job protection, protection of the pregnant woman at the workplace, prohibition to work immediately before and after birth, and financial compensation for reduced employment. Another law was enacted to grant both mothers and fathers the legal right to take parental leave for up to 3 years so that they can look after and spend more time with their children and reduce their working hours. The time of parental leave can be split between mothers and fathers. From the time when parental leave was claimed until its end, parents are protected against dismissals. Aside from laws and regulations, parents are paid child benefits until a child reaches the age of 18, an income that allows parents to support themselves but not the subsistence level of their children and housing allowance if their income lies within certain predefined boundaries, child-raising allowance for parents working less than 30 h per week to raise their children, and tax allowance for children, depending on family income and the number of children.

In the context of Hong Kong, employee-friendly policies are uncommon in most workplaces. A study commissioned by the Equal Opportunities Commission of Hong Kong has found that only 10% of the employers have in place formal policies or guidance for creating an employee-friendly workplace. Even for those where employee-friendly practices are available, the utilization rate is very low. A household survey conducted with 1,005 employees aged 25 and above face-to-face in 2014 revealed that among nearly half of the married interviewees, about 54% said they were not allowed to take family leave such as paternity leave, parental leave, marriage leave, and compassionate leave. The figure rose to 76% when it came to paternity leave. While 452 of those interviewed said there was a family-leave policy at work, only 15% said they had used it in the past year. The low utilization rate of employee-friendly policies is possibly attributable to the low level of supervisor support. According to the interviewees, only one-third of their supervisors understood the family responsibilities of their staff, and 25% and 16% of the supervisors hardly or never ever did so. Statistically, the utilization of employee-

friendly policies was as low as 40% in 2014. One of the reasons accounting for their lack of supervisor support in Hong Kong is that local businesses tend not to associate supervisor support with staff performance. It is the city's workplace culture not to show support for employee-friendly practices because employers generally expect their employees to prioritize work over family; otherwise, they will be more vulnerable to being laid off. As a matter of fact, Hong Kong has long been characterized by long working hours. According to a 2010 survey from a local nongovernmental organization, the people in the city work an average of 48.7 h per week, which is 22% higher than the recommended 40-h workweek of the International Labor Organization. Another survey indicated that the quality of living is more related to the extent of family-work conflict but less to the amount of pay. The survey was conducted by Oxfam Hong Kong and Policy 21 in 2011 to study the impacts of the introduction of the Minimum Wage Ordinance on the lives of low-income workers and families. It was found that after the introduction of the Ordinance since July 2010, 59.5% of the respondents expressed that their overall family life had not improved, while 28.3% said it had slightly improved and only 4.3% said it had greatly improved. The survey results indicate that the underprivileged will not be better off in terms of their quality of living if work-family conflict is not properly addressed.

## Conclusion

Creating an employee-friendly environment is crucial for retaining talent and building a strong leadership pipeline. Some women may be forced to choose between their career and their family if employee-friendly policies are not in place, which will in turn lead to a drain of female talent. However, work-family balance is not solely a woman's issue; men in general are also facing difficulties in balancing work and family. At the root, men find themselves gradually displaced due to stereotypes. Most of them still build their self-identity on being the breadwinner and protector of the family. At the same time, they also face larger demands on their contribution as a father. Owing to the stereotype that family matters are performed by women, there is a lack of institutional support for men to take up family duties in the workplace, so many of them may hesitate to ask for leave, time off, or flexible work arrangements for fear of being regarded as a slacker by other employees. In countries where employee-friendly policies are still an option, actions are being called for making employee-friendly workplace policies mandatory to initiate a change in the business culture. However, some have warned about the potential for several unintended consequences. Businesses may decide it is easier and cheaper to discriminate against women of childbearing age when hiring, which is happening in Chile and Spain, and the cost to business of paid parental leave may be recovered through slower wage growth, resulting in broadening wage differentials between men and women. After all, continued efforts have to be made to increase the awareness and acceptance of employer-friendly corporate policies and to cultivate trust between employees and employers. In the federal aspect, gender-neutral policies may be devised to help working families. One of the examples is the parental leave policies implemented in Sweden and Quebec to encourage both men and women to take time off for newborn babies.

# Employment Creation for Youth in Urban Areas of Developing Economies: The Ethiopian Experience

Dejene Mamo Bekana
Department of Social and Political Sciences, University of Milan, Milan, Italy

## Synonyms

Ethiopia; Labour market; Unemployment; Urban youth

## Definition

This paper finds out that there are various policies and strategies put into practice by the government for employment generations targeting the youth. These policies and strategies were relevant to the improvement of the demand and the supply sides of the labour market. Those policies and strategies on the demand side of the labour market include the special incentives and supports provided for private sector development, promotion of the development of micro and small enterprises, and the public employment generation system. On the supply side of the labour market, there has been significant effort to improve labor productivity through education and training. The paper concludes that these interventions have proved to significantly impact employment but have been embarrassed by the weak labour market information system, the low demand for labor due to structural weakness of the economy, and shortage of government budget.

## Introduction

Creation of adequate employment opportunities remains one of the greatest challenges for Ethiopian policy makers for a long period of time and definitely in many other countries of the developing world. The 2012 Report by the International Labour Organization, estimated, for example, that the world unemployment rate would remain stuck around the current 6% up to 2016. The Report further points out that the number of unemployed labor force around the world in 2012 was 200 million and will rise to 206 million by 2016. Globally, the youth are the most hurt due to unemployment. In 2011, 74.8 million youth aged 15–24 were unemployed in the global labour market. The global youth unemployment rate in 2012 is at 12.7% showing the chance of young people to remain unemployed nearly three times as likely as adults to be unemployed. That means the youth-adult unemployment ratio is about 3.00. According to the Report, the rate of unemployment in sub-Saharan Africa eased marginally with the youth bearing a relatively large burden of the unemployment. Employment remains the main concern of youth in the sub-Saharan Africa, and country variations are important to note. For example, youth unemployment rates in Malawi and Rwanda are under 5%, whereas rates reach above 20% in Ghana, Zambia, and Zimbabwe and above 30% in Mauritius, Botswana, Lesotho, Namibia, Swaziland, and South Africa.

The scenario is similar for Ethiopia where the employment challenge has been pervasive with the youth being the main casualties (Broussard and Gebrekidan 2012). That is, the youth labour market is of particular concern for Ethiopian policy makers as a result of high proportion of youth in the demographic profile of the population size. There is concern that more youth bulge in the demographic structure creates difficult pressures on the labour market and a growing youth population can have important long-run implications on youth unemployment. In 2007, Ethiopia's total population was estimated to be about 73 million people; this represented a 38% increase from the 1994 census result. The total youth population is around 20 million, representing 28% of the

population. By 2014, the Ethiopian population is estimated to be over 90 million with the youth making up around 30 million of that aggregate.

Millions of Ethiopians especially the youth and women are unemployed, underemployed, or in the swelling ranks of the working poor (Genene Bizuneh et al. 2001). According to the 2010 Urban Employment Survey by the Ethiopian Central Statistical Agency, 4,790,958 million out of the 5,907,470 million labor force were reported as employed with the remaining 1,116,512 million people being openly unemployed. That is, the urban population unemployment rate is 18.9%. The corresponding female unemployment rate is reported to be 27.4%, while the male unemployment rate is 11%.

In the Ethiopian national demographic profile, the youth are those within the 15–29 years of age. The aggregate youth unemployment rate for those within 15–29 years in urban areas is found to be 23.3% in the year 2011. Statistical evidence shows that in this category younger females are more affected by the incidence of unemployment compared with their male counterparts. The May 2010 Urban Unemployment Survey result revealed that young females' unemployment was as high as 31.6% compared with the 16.6% for young males. However, the March 2012 survey result reveals that the overall urban unemployment rate is 17.5% and the corresponding male and female unemployment rates are 11.4% and 24.2%, respectively. Although urban aggregate unemployment and youth unemployment have shown a decline in recent periods, the differentials of unemployment by sex show that female unemployment is more than two times as compared to that of males.

The government of Ethiopia has been implementing various policies to address the challenge of poverty and unemployment especially youth unemployment (Woldehanna et al. 2008). The various government policy implementations over the past two decades started to yield positive results for youth employment. In 1991, with the downfall of the Marxist era of the command economic system, the Ethiopian government identified poverty and unemployment as the twin challenges facing the country. The government identified that poverty is the number one enemy of the country, and the agenda of the government is eradication of poverty through pro-poor growth policies. More than 20 years later, and despite numerous policy efforts, poverty and unemployment continues to challenge the lives of many Ethiopians.

A number of policy interventions have been formulated and variously executed to address the challenges posed because of unemployment in Ethiopia. Key among these policies is the growth-oriented development strategy augmented with the widening opportunities for the disadvantaged group especially women and the youth. The government also undertook to engage in direct employment creation, regulate wages, and improve labour market information systems and re-orientation of education and training systems to skill development-based vocational and technical training areas as a means of promoting employment creation.

Starting from the middle of the 1990s, government employment interventions targeted enhancing the acquisition and promotion of efficient use of labour market information, reliance on market forces to mobilize resources for sustained growth, provision of public infrastructure, enhancement of private sector investment, and participation in the economy. More recently, the government of Ethiopia realized the development of micro and small-scale enterprises and promotion of industrial harmony and productivity to curb the urban employment problem. In spite of all these interventions, creation of adequate, productive, and sustainable employment continues to be among the major challenges in Ethiopia.

Urban areas in Ethiopia like in many developing economies are characterized by very high rate of youth unemployment. Urban youth represents more than one fourth of the urban population in Ethiopia. Even though the unemployment rate for this segment of the demographic structure has been declining from as high as 31.5% in 2004 to 17.4% in 2014, still it is high. The literature on urban youth employment in sub-Saharan African economies provide strong evidence that unemployment and underemployment among the youth are often higher than among adults

(Gibb and George 1990); the youth are more likely than adults to be in the informal sector, and less likely to be wage employed or self-employed; and the youth are more likely to work longer hours under intermittent and insecure work arrangements, characterized by low productivity and meager earnings.

Most studies attribute the challenges of urban unemployment to various interrelated and interdependent factors which include a higher rate of urban population growth, failure of the informal sector, cuts in government expenditure, the effect of the structural adjustment programs, rising capital intensity in the production and distribution of goods and services in the modern private sector, low quality of education, and a mismatch between the skill demand of the labour market and the skill supply of the learning institutions (Berhanu et al. 2005). It is also widely recognized that youth unemployment is posing various undesired socio-political and economic costs. Youth unemployment is usually the basis for social crisis, political instability, and prevalence of crime and robbery which are detrimental to economic growth and development (Woldegebriel 2011). The fact that the youth are large in the demographic structure more importantly implies that youth unemployment compels most of the productive labor force segment of the society to remain economically inactive adversely affecting economic growth and development. Thus, this article reviews the challenges and prospects of urban youth (un)employment and government intervention policies in lieu of the following research questions:

- What is the nature and what are the causes of urban youth unemployment in the context of Ethiopia?
- What is the nature and what are the types of government interventions to address the issues of unemployment and elaborate successes, failures, and lessons learned?

## Literature Review and Conceptual Framework

In defining unemployment, different researchers viewed it differently. For instance, Adebayo (1999) defined unemployment as a state in which people who can work are without jobs and are seeking for pay or profit. This definition gives rise to the problem of measurement, especially when we are interested in knowing the average rate of unemployment in the economy over a period of time. Falae (1971) argues that such a definition is too broad because some categories of people who are without work should not really be regarded as unemployed in any meaningful sense because anyone who is unable to work is not counted as unemployed, even though he or she would love to work. Unemployment literally applies to all persons without work and actively looking for work (Encyclopedia Americana 1995). But for Englama (2001), unemployment rate in an economy is the number of people unemployed expressed as a percentage of the total labor force. The total labor force is defined as the number of people employed plus the number of people unemployed within the age bracket of 18–60 years.

Urban youth unemployment stands for the conglomerate of youths with diverse background, willing and able to work in urban areas (Onah 2001). This results in pressures of supply of labor over the demand for labor, thus causing joblessness. Given the lack of sufficient employment opportunities in the formal sector, young people are compelled to engage in casual work and other unorthodox livelihood sources, often of a criminal nature (Gibb and George 1990). According to Todaro (1992), the high rate of urban unemployment is a result of continuous transfer of economic activities and youths from rural to urban areas.

Economic theory attributes the problem of youth unemployment to the problems with supply side of the labour market, the demand side of the labour market, and the labour market information system. According to Birhanu et al. (2005), supply-side factors such as demographic structure, education, and training policies affect the labour market outcomes in an economy. Demand-side issues including aggregate demand of the economy and the absorptive capacity of the economy for labor through development of enterprises and job creation are also key factors that affect unemployment (ibid.). Moreover, the

labour market information system and the institutional and labour market policies can play an intermediary role in the interaction of the supply and the demand sides of the labour market (Mangozho 2002). Worldwide and in Africa as well, the ratio of the youth-to-adult unemployment rate equals 3, which clearly points out the substantial difficulties of youth participation in the labour market. Yet, the youth employment elasticity to GDP growth is low and only a fifth of that observed for all workers (Kapsos 2005).

For Nzinga H. Broussard et al. (2012), the structural strength of the economy and the economic growth rate are important demand-side determinants of youth unemployment, while human capital formation through education and training is a key supply-side determinant of youth unemployment besides the intermediation role of the labour markets information system. For Okojie (2003), supply-side factors such as rapid population growth and poor quality education and demand-side factors mainly explained by poor economic performance and a weak and small-sized private sector are responsible for unemployment.

A study by Tegegn Gebeyaw and Tesfaye Chofana (2012) using cross-sectional data on urban youth unemployment in Ethiopia identified that tanning and education attendance are basic determinants of urban youth unemployment. Youth unemployment in urban Ethiopia is very high mainly because of rapidly increasing labor supply which is not compatible with macroeconomic conditions in general and the performance of the industrial sector in particular (Getinet 2003). A World Bank study in 2007 on challenges and prospects of the urban labour market in Ethiopia found that despite overall growth in the economy, the urban sector has not yet become a dynamic engine for growth, employment creation, and poverty reduction as a result of the segmentation of the labour markets into three broad segments: the relatively privileged public sector; the private formal, and the large informal economy, which is mainly characterized by small scale and more "survival" than entrepreneurial.

The presence of relatively large youth cohorts is a factor that generally can be argued to reduce the opportunity cost of young persons (Collier 2000; Machunovich 2000). Specifically, social or economic marginalization might prevent the accumulation of human capital and wealth and increase competition for employment, thereby reducing the "alternative cost" to engaging in violence (Collier 2000; Collier and Hoeffler 2004). Large youth cohorts have been argued to be particularly likely to face unemployment, expansions in higher education with limited employment opportunities, lack of political openness, and crowding in urban centers (Braungart 1984; Huntington 1996; Cincotta et al. 2003). Hence, youth engage in violence as a means to redress economic, political, or social inequalities and perceived grievances.

Economic activity is an important variable in determining youth unemployment. When the economic activity is healthy and developing, employment as well as youth employment will be better. The economic downturns and crises can affect employment as well as youth employment negatively. Youth unemployment also depends partly on economic activities, demographic conditions, and individual characteristics of youth themselves (Freeman and Wise 1981). After the global crises, the number of unemployed young people has increased from 73.5 million in 2007 to 77.7 million in 2010. The business cycle has an important effect on general employment as well as youth unemployment. But generally in the economic recession, the rate of youth unemployment increases more than adult unemployment. For Borowski (1984), when the excessive supply of labor occurs in the recession, employers prefer mature workers rather than unpracticed youth workers.

Policy makers around the world consider different intervention policies to counter the adverse social, political, and economic consequences of urban youth unemployment. The common intervention mechanisms usually target the failure of the demand and supply sides of the labour market. To address the challenges of the demand side of the labour market, governments use promotion of economic growth through public and private sector investments and development of skills through education and tanning to address the failures in the supply side of the labour market while improving the intermediation role of the labour

market information system. According to Tomas Stenstrom et al. (2006), globally in developing economies there is a growing interest in the need to link job creation to infrastructure investments such as housing, transport, urban redevelopment, and municipal service delivery to urban and local development policies. Based on the reviews and discussions in the preceding section the, the conceptual framework of this paper is developed. The schematic design of the conceptual framework, therefore, is as follows (Fig. 1).

## Urban Youth Employment in Ethiopian Context

The problem of unemployment basically arises from two essential dimensions of the labour market – the demand and supply sides of the market (Okojie 2003). The demand-side dimension of the labour market is associated with the capability of the economy to generate employment opportunity for various skill categories as per the requirement of the economy (Broussard and Gebrekidan 2012). The supply-side dimension of the labour market deals with whether the skill levels of available labor force match with the type of skills that the economy demands. In addition to the labour market dimensions, labour market institutions such as the governance of labour market-industrial relations and labour market services play a significant role in employment promotion (Mangozho 2002). This implies that ill-governance of labour market institutions could lead to unemployment problem.

### The Demand Side of the Labour Market

Unemployment and particularly youth unemployment is closely linked to the state of the economy (Broussard and Gebrekidan 2012). The capacity of the economy to generate new job opportunities directly affects the state of urban youth unemployment. Therefore, it is important to analyze the structure as well as the performance of the Ethiopian economy to look at its implication on the urban youth unemployment problem. The agricultural sector is the dominant sector in the Ethiopian economy with over 41% to Gross Domestic Product (GDP), 60% of exports, and employing approximately 83.5% of the country's population. The agricultural sector in Ethiopia employees the rural segment of the population and job

**Employment Creation for Youth in Urban Areas of Developing Economies: The Ethiopian Experience, Fig. 1** Schematic design of the conceptual framework. (Source: Author's construction)

opportunity for urban youth in this sector is out of reach. The second largest contribution to the national GDP of Ethiopia comes from the service sector. Recent reports revealed that the contribution of the service sector to Ethiopian gross domestic product is about 46%. The service sector of the economy has not only shown flamboyant performance with regard to its contribution to the GDP in recent years but also generated significant employment opportunity. However, recent evidence reveals that the industrial sector is getting into momentum in generating employment although the industrial sector's contribution to GDP is very minimal with about 13% comparative to the two dominant sectors in Ethiopian economy. This indicates significant structural weakness of the economy (see Fig. 2). Employment opportunity for urban youth is directly related to the development of the industrial sector of the economy. The low level of development in the industrial sector of the economy therefore is one of the major issues that explain urban youth unemployment problem.

Ethiopia terminated the structural adjustment program in 2002/2003 and since then has achieved a remarkable economic growth for which she received complementary report from the World Bank and International Monetary Fund (Woldehanna et al. 2008). The remarkable economic growth rate performance of double digit

**Employment Creation for Youth in Urban Areas of Developing Economies: The Ethiopian Experience, Fig. 2** Sectoral Gross Domestic Product (GDP) composition and Sectoral Gross Domestic Product (GDP) growth rate. (Source: National Bank of Ethiopia, 2014)

in recent years is because of the implementation of pro-poor growth policies leading to significant reduction in poverty level. The average economic growth rate between 2003/2004 and 2012 is about 10%, a figure well above the planned target of growth. The economic growth record is attributable to congenial pro-poor growth policies. In recent years, the government has adopted a robust growth and poverty reduction strategy, focusing on infrastructure development, commercialization of agriculture, improvements in access to basic services, as well as private sector development, including the creation of appropriate regulatory and institutional frameworks to support private business.

It is understandable that growth is central to employment creation. According to the 2007/2008 Population and Housing Census, employment grew by a mere 2.2% between 1995 and 2008, while unemployment grew by 4.4% over the same period. This suggests that growth has not generated adequate employment opportunities. A more recent urban employment and unemployment survey, however, shows that the urban unemployment rate declined from 26.2% in 2007/2008 to 18% in 2010/2011. The expansion in employment opportunities in major urban areas is attributed to, among others, the boom in construction activities and expansion in public sector employment. Growth has certainly helped generate employment, but not sufficiently. Despite its remarkable growth performance, the country faces major challenges in terms of providing adequate employment opportunities for the growing labor force in general and for young people in particular. According to the 2007/2008 census, youth, defined as those between 15 and 24 years of age, accounted for 20.5% of the total population. Youth activity rate was 64% in 2007/2008, yet young people accounted for only 27% of the total employed population (ibid.). From the total employed youth population, a significant proportion were in the agricultural sector, distantly followed by wholesale and retail trade, suggesting that young people are mainly engaged in sectors with low productivity and, hence, low incomes.

Figure 2 above using data from the National Bank of Ethiopia depicts the annual growth rates of GDP and for each sector. Since about 2005, the service and the industrial sector since 2007 have outgrown the agricultural sector constantly. Yet while most of the country's growth potential appears to come from the industry and services sectors, the government has chosen to emphasize the agricultural sector in pursuing economic growth under the agricultural development-led industrialization policy umbrella. Between 2004 and 2013, the service sector exhibited remarkable performance (far more than planned); however, the industrial sector under-performed and even failed to hit its base case scenario in the Five-Year Plan target. This is one more clear fact to evidence the existence of substantial structural weakness in the economy as success in the industrial sector is believed to be the key for sustainable employment and growth of the economy. The demand-side problems of the labour market in African economies is attributable to the structural weakness of the economies, saturated public services, and small private sector bases that are unable to employ large numbers of people.

### The Supply Side of the Labour Market

The supply side of the labour market is concerned with whether or not the skill levels of available work force match with the type of skill that the economy requires. Primarily, it is concerned with enhancing and increasing labor productivity, which can be achieved mainly through education and training. For Martha Kibru (2012), access to relevant and quality education plays a substantial role in explaining the incidence of unemployment. According to, the literacy status of the surveyed urban population of the country aged 10 years and above was found to be that 80.2% and 19.8% are illiterate. The proportion of literates among the males (89.4%) is higher than that of the females (72.0%). The lowest proportion of illiterate has been observed for males (10.6%) against (28.0%) females. However, the unemployment rate among the urban areas for the four recent survey periods shows that the unemployment rate of literate persons is higher than illiterate persons. Nonetheless, the level of unemployment for young people with technical and vocational training (TVET) is very low, which indicates that the expansion of technical and

vocational education and training (TVET) is central to reducing youth unemployment. Furthermore, the result illustrates that the unemployment rate of literate and illiterate persons declined during the four survey periods. Among the literate group, the highest rate of unemployment is found for those who did not complete secondary, secondary completed and preparatory education level. The lowest unemployment rate is reported those who had degree and above about 7.3%. Of the total employed youth population, a significant proportion were in the agricultural sector, distantly followed by wholesale and retail trade, suggesting that young people are mainly engaged in sectors with low productivity and, hence, low incomes.

The surprising result in this analysis is that unemployment is adversely affecting more the literate relative to the illiterate. This implies that there is mismatch between the skills developed by education curriculum and the skill that the economy demands. This is attributable to the theory orientation of the general education system of the country in the 1980s and early 1990s. Theory-oriented education system ignores the development of skills which are essential to be effective at the workplace and is neither good at development of entrepreneurial and innovative capabilities. The theory orientation of the education system in Ethiopia without due emphasis on vocational and technical trainings failed to improve the cognitive skills of students and their aspiration for success. Hence, the analysis in this paper culminates with the conclusion that the fundamental problem with the supply side of youth unemployment lies with mismatch between the skill that the training and education institutions entrust in their students and the skill that the labour marker requires. Mismatch between educational systems and the skills needed in the labour market is one of the fundamental and noticeable causes of youth unemployment in sub-Saharan African economies.

## The Labour Market Information System

Labour-market information system refers to the manner in which information in the supply side of the labour interacts with the demand side of the labour market. Labour market information system can be defined as a set of institutional arrangements, procedures, and mechanisms that are designed to coordinate the collection, processing, storage, retrieval, and dissemination of labour market information (Sparraboom 1999). It is the system with which job seekers and employers get access about the labour market performance. That means institutional mechanism should be in place to collect, analyze, and report the performance of the labour market to job seekers and potential employers. Lack of labour market information system is one of the major impediments to the desired matching between the supply side and the demand side of the labour market. That means employment services are very important to properly align both sides of the labour market. Such services include but are not limited to registration of job seekers into a database system, counseling and guidance services, job matching, and labor exchange referral to active labour market programs.

Employment services managers need general information on vacancies, job seekers, changes in skill and occupational requirements, career prospects in various industries and occupations, and education and training programs in planning for employment services delivery. Employment services placement staff need rather specific information on both job vacancies and job seekers to be able to successfully match vacancies with job seekers. As far as job vacancies are concerned, they need to know the location, title, description, skill and experience requirements, remuneration levels, and working conditions associated with each vacancy. In the case of job seekers, placement staff requires specific information on each individual's education, training, and work experience. This information allows the staff to select the appropriate occupational codes for each vacancy and each job seeker so that matching can take place. Vocational guidance and career counselors need occupational outlook information that provides them with a sound understanding of changes taking place in the occupation and skill requirements of the labour market. In addition, they need access to information on the location, timing, entrance requirements, and

availability of education and training programs. This type of information can provide guidance and counseling staff with insights and information that allow them to help clients make and pursue realistic career choices.

Ethiopia has documented an employment policy, and the Ministry of Labour and Social Affairs is in charge of the collection, analysis, documentation, and distribution of the labour market information at the country level. Congruously, the Ministry of Labour and Social Affairs has been publishing the Labour Market Information Bulletin meant for dissemination of the labour market information to stakeholders on an annual basis. The publication incorporates varieties of information collected and analyzed from such sources as census repots, labor force survey, employment survey, and educational statistics of the federal ministry of education.

Although labour market information is useful in matching the demand and supply side of the labour market as well as in supplementing the design and execution of labour market intervention policies, the scenario in Ethiopia shows that the labour market information system is weak even to provide the basic employment services (Kibru 2012). A labour market study by the World Bank proved that both the private sector brokers and the public sector labour market information providers are weak to serve the market function properly (World Bank 2007). This fact leads to failure of employers to attract the most qualified. In a similar fashion, qualified job seekers cannot find sufficient jobs and revert to personal networks to get employed. That means lack of the informal networks would lead to unemployment causality for qualified urban youth. Currently, the labour market information system in Ethiopia is insufficiently developed to provide information for both job seekers and employers. Moreover, the available information on labour market developments in the country is often fragmented and limited in scope or out-of-date. The relevant labour market institutions which are causes of youth unemployment in Africa include labour demand barriers, such as observed discrimination by employers toward young people on the grounds of lack of experience; information gaps between job seekers and potential employers. Hence, strengthening the labour-market information system is therefore very important so that it can play its intermediation role between the supply side and the demand side of the labour market.

## Government Intervention Policies and Practices

It is the nature of holistic employment creation policy to address the problems of the demand side and the supply side of the labour markets. The Ethiopian government has been implementing programs which provide unskilled young people with short-term employment that can serve as work experience in fields such as road construction, maintenance, irrigation infrastructure, reforestation, soil conservation, and urban sanitation programs. The Ethiopian government development policy has been based on the use of labor-intensive technologies owing to the labor force endowment of the country. The government has maintained significant intervention in the key economic sectors such as the sugar industry, the telecom services, cement production, banking services, and energy generation and distribution which are employment intensive. The government of Ethiopia has been investing a significant portion of its budget to infrastructure development and poverty-targeted programs specifically the social sector development and economic development programs. In its investment to infrastructure development, the government deliberately pursued labor-intensive approach with the view to create job opportunity for thousands of unemployed youth. However, the employment gain in Ethiopia from public infrastructure investments is limited (Kibru 2012). Nonetheless the contribution of the construction industry has been enormous to the employment creation efforts of the government. This sector is foreseen to continue to generate significant level of jobs as stipulated in the *Growth and Transformation Plan* crafted for 5 years from 2010 to 2014. According to the Growth and Transformation Plan, the basic infrastructure development construction could generate 1,264,598 employment opportunities over the

plan period, the target beneficiaries being the youth.

Private sector development is instrumental and a major employer in a civilized society with capitalist economic system. The recent development in Ethiopia also follows this pattern. In transition economies like Ethiopian economy, the development of the private sector requires support from the government. Policies conducive to enhancement of the productivity of the private sector are important for this purpose. Equally important is the improvement of the linkage between the formal and informal sectors of the economy. The prevalence of informal economic activities is natural in Ethiopia as it is in transition economies. That means improving the complementarities between the informal and formal sectors of the economy can enlarge the business activities making more job opportunity.

The policy environment of the pre-1991 Ethiopia significantly restricted private sector investment if not considered totally banned under the Marxist-Leninist social policies of that regime. In that regime, the maximum capital investment allowable for private owners was limited to Br 250,000. With the complete demise of the socialist era in 1991, there have been significant economic reform measures undertaken to make the business environment congenial to entrepreneurship and private sector investment. The government implemented extensive deregulation and liberalization policies with proper proactive actions. The aim being the creation of cordial business environment for the promotion of private sector investment, the government has been providing supports of diverse form to entrepreneurs and industrialists that yielded significant and progressive record development in promotion of private investment both domestic and foreign investments.

Cognizant of the social and political consequences of youth unemployment, the government has designed and implemented programs which targeted job creation for the youth over the last decade (Serneels 2004). The most noticeable policy actions were the introduction of *Micro and Small Businesses Development Strategy and Industrial Development Strategy* with the purpose of promotion of private sector development so that it plays a significant role as engine of economic growth and development. Since the *Micro and Small Enterprises Development Strategy was crafted in 2004*, the youth has been encouraged to enter into micro and small enterprises in an organized way with special support rendered from the government. The support includes provision of entrepreneurship and business management training, mutual guarantee credit services through micro-finance institutions, market linkage services, relevant technology research, business development services, and basic infrastructure deemed necessary for their operation. The government has shown its commitment to continue supporting the development of micro and small enterprises in an institutional and coordinated approach by the established Federal Micro and Small Enterprises Development Agency, and state governments stepped in by establishing similar agencies at regional levels. Ethiopia's policy of generating employment for the youth through enhanced skill development in the economically active population is similar to what is in practice in its counterparts of sub-Saharan African economies (UNECA 2011). As part of the efforts to boost job opportunities for young people, countries such as South Africa, Kenya, Tanzania, and Tunisia have developed young entrepreneurship programs and business start-up schemes supported by Small Business Development organizations, which provide technical skills for new businesses. Another strategy used by other African economies not introduced by Ethiopian policy makers so far is provision of incentives to firms for the hiring of young people. Such efforts have yielded some positive results; for example, 1.27 million jobs were created in Tanzania over the last 3 years as a result of these programs according to the evidence from the 2011 fact sheet of the United Nations Economic Commission for Africa.

The implementation of Micro and Small Businesses Development Strategy and Industrial Development Strategy has recorded enormous achievements in the creation of employment opportunity for the youth in urban areas. It has benefited

millions of youth in Ethiopian urban areas since its inception. Statistical evidence from the Federal Micro and Small Enterprises Development Agency revealed that the sector created employment opportunity for more than 1,150,000 unemployed youth in 2011 in Ethiopian urban areas. The Micro and Small Enterprises Development Agency has managed to achieve encouraging results in supporting the development of enterprises that are employment intensive so far. There are large numbers of micro and small-scale enterprises graduated from their original level and transformed to medium-scale industries. This could be proving for the successful support rendered from the government to the development of the sector on the one hand and the capacity of the sector in employment generation and poverty reduction on the other hand. However, critics argue that the micro enterprise operators are developing dependency syndrome being locked into the market linkage established by the government. Although the sector has shown its contribution to economic growth and development, there are a number of constraining factors that hinder its growth. The basic constraining factors are associated with inadequacy of the provision of working premises, prototype development trainings, and infrastructure and credit facilities (Kibru 2012). These constraining factors explain the challenges of youth employment in sub-Sharan African economies. Biers to the creation and development of business opportunities, particularly in gaining access to financial, physical, and social capital, are basic problems for job creation for the youth (UNECA 2011). This implies that periodic evaluation of the working policies and strategies with the aim of innovative amendment is vital to exploit the contribution of the private sector development to employment creation and poverty reduction.

To supplement the demand side of the labour market, the government of Ethiopia introduced specific and youth-targeted programs. One of such programs is the cobblestone project in urban Ethiopia which was initiated by the Engineering Capacity Building Program supported by the German Development Cooperative (GTZ). Since 2007, the Engineering Capacity Building Program has been training the youth in traditional crafting of cobblestone paving with the dual objective of creating jobs for youth and creating clean, attractive pavement roads in Ethiopian towns. It is based on the principle of local resource utilization in a labor-intensive manner to pave roads and public spaces using environmentally amicable approach adopted from the German experiences. The project created jobs for the youth organized to operate micro and small enterprises. This means construction of pavements in towns and cities enabled creation of new micro and small enterprises thereby boosting housing investment. Available evidence shows that the project has resulted in the creation of more than 2,240 micro and small enterprises and employed more than 489,000 (40% of the beneficiaries are women) youth in urban areas of Ethiopia by the end of 2013.

Also the integration of the employment strategy to Urban Housing Development Policy has contributed to employment creation, most of the beneficiaries of which are unemployed urban youth. The integrated urban hosing development program ultimately targets the unemployed poor particularly the unemployed youth, in that the micro and small enterprises in the construction sector tend to be labor intensive and employ low-skilled workers. The participating micro and small enterprises are usually established by youth who either graduated from a TVET or have had certain experience in the construction sector. The federal as well as the regional housing development offices provide different forms of assistance to the firms participating in the program. The program commissioned in 2004 set up an ambitious goal of constructing 400,000 low-cost condominium houses, creating job opportunities for 200,000 people, and promoting more than 10,000 micro and small enterprises all over the country between 2005 and 2010 (Un-Habitat 2011). By 2013, the program had constructed about 280,000 houses, created 500,000 new jobs, boosted the technical capacity of the construction sector, and enhanced the number and capacity of micro and small enterprises.

As discussed earlier in the supply-side problems of the labour market, the youth are challenged due to unemployment because of the mismatch between their skills and the skill

the economy requires. The most noticeable reaction from the government to this problem was the policy reform introduced to the education system of the country to transform the century-long theory-oriented education into practice orientation and skill development. Up to the middle of the 1990s, the orientation of the education system of Ethiopia was on theory rather than development of skills essential for effective practical exercise and entrepreneurial innovation. Comprehensive education system reform was introduced in 1994 with due consideration of the deficiency in the previous education system. The phases of education cycle classification in the previous system were as follows: grades 1–6 are primary school, grades 7–8 junior secondary school, and grades 9–12 secondary or high schools. At the end of the 12th grade, students were given Ethiopian school leaving certificate examination to qualify for tertiary education. But a few of the examinees go for university study owing to the limited number of higher learning education institutions leaving the rest without opportunity for higher-level skill development. According to an urban employment survey by the Central Statistical Agency in March 2012, those with general education are substantially victims of unemployment.

Amid the education sector reform, Ethiopia has recorded remarkable development in access to primary education and literacy. There has also been evidence for significant improvement in access to primary education and literacy across Africa in the last decade (UN 2010). According to the United Nations 2010 Millennium Development Goals Report, However, the increase in primary education enrolment rates has not necessarily been followed by an equivalent increase in secondary and tertiary education rates, especially for young women and girls. The 2011 *African Youth Report* confirmed that when it comes to tertiary education among youth populations, the increase in primary education enrolment has not been accompanied by an equivalent rise in secondary and tertiary education enrolment. The participation of women and young girls is significantly lower at the tertiary level compared with the participations in primary education. Increased provision of post-primary education could provide the youth with the hard and soft skills that will enable them to compete effectively in the labour market both domestic and global. This education deficit particularly affects socially excluded youth people especially young women. Ethiopia like many African countries has achieved gender parity at the primary education level. However, disparity remains significant, especially at the tertiary education level.

The new education system introduced in Ethiopia after the reform classified the phases of the education cycles in the following manner: grades 1–8 are primary schools, and grades 9–10 are the first cycle of the secondary school. The policy stipulates that these levels provide general academic education that prepares the students for further education and skill development. Grades 11–12 are second cycle secondary schools or preparatory schools for college and university educations. Only those who scored qualifying results on the national exam offered at the end of the 10th grade would be promoted to the preparatory schools. Those who do not achieve the necessary results for admission to the preparatory schools are provided with the opportunity to pursue formal education thorough Technical and Vocational Education and Training (TVET) which ranges from 1 to 5 years based on the level of competency the trainees want and the nature of the field of study chosen. For this purpose, a great number of polytechnics and technical training institutes were established to provide technical training in different trades and at various levels in a bid to strengthen the employability of the youth. This is the landmark departure of the current education system from the previous education system of the country in which most of the secondary school complete remain helpless for further skill development. The positive impact of the Technical and Vocational Education and Training programs in enhancing employability of the youth in Ethiopia has been documented in various studies although comprehensive evaluation of the impact of the policy reform is yet to come. The impact of participating in training programs increases the probability of being employed by 25% in urban areas of Ethiopia and by about 13% in rural areas (Guarcello and Rosati 2007).

In a bid to improve the employability of the youth, the government has been investing substantial portion of the public budget to the expansion of universities that accept qualified candidates from the preparatory schools. There have been enormous achievements with this respect, and the number of universities just like the polytechnics and technical training institutes has been considerably increased from as low as 2 in 1991 to 31 in 2012. Moreover, the government devised modes of linkage between higher education institutions and the industry and initiated curricula reforms to ensure relevance of higher education to Ethiopian economy. In spite of all these efforts, the fact that the economy could not absorb the graduates and unemployment started to challenge the literate is evident (Kibru 2012). This is partly attributable to the lower quality of education and of course to the mismatch in skills desired by the economy and skills embedded in the graduates. The lower quality of education is because of the capacity constraint of the poor government of a poor country to equally pursue expansion of access to education and assurance of the quality of education. However, the government has shown its commitment to ensure the quality of education in an institutionalized approach and established Higher Education Relevance and Quality Agency (HERQA) affiliated with the Ministry of Education so as to enforce quality standards of higher education to remedy the quality problems.

## Conclusions and Policy Implications

The principal reasons for Ethiopia's youth unemployment rates are a mismatch between educational systems and the skills needed in the labour market and small private sector bases that are unable to employ large numbers of people coupled with the structural weakness of the economy that is dominated by the agricultural and service sectors with the contribution of the industrial sector limited to about 13% in the gross domestic product.

The finding of the study implies that current efforts have gone into building young Ethiopian's knowledge and skills through the provision of basic levels of education and vocational training. However, in the new global economy, young people need to acquire more than just basic education, and curricula should be influenced by the current rate of globalization and regional integration. Investing in education and skills development for young people should therefore go beyond increasing basic literacy rates to assure dynamic, multifaceted knowledge building at higher and tertiary levels. This will go a long way in preparing young people for the evolving labour market. Investment into education has to be focused on the development of skills and innovative powers of the youth so that they can effectively compete in the labour market. For this reason, it is commendable to strengthen the technical and vocational education and training (TVET) and polytechnics that entrust practical skills into graduates thereby improving the employability of the youth.

Demand-driven investment into human capital through education and skills development for young people remains of paramount importance to Ethiopia because of the return on education and the contribution to poverty reduction. To this end, it is important to ensure the participation of the industry operators in the design and implementation of educational curricula. Employers have an important role to play in improving the profile of vocational education for young people. Unemployment, underemployment, decent work, and integration into the mainstream of development remain priority concerns for young Ethiopians.

In establishing policies for youth employment, emphasis has to be given to the demand side of the labour market specifically concentrating on promoting economic growth and job creation. With this regard, the recent double-digit economic growth that Ethiopia witnessed has obviously created job opportunity for many young Ethiopians. However, it neither created sufficient job opportunity nor changed the structural weakness of the economy so far. This implies there is a need to pursue growth policies and strategies that are labor intensive. That is, government investment into infrastructure development has to maintain its momentum, and private sector development in the industrial sector has to be encouraged. Entrepreneurship has to be promoted making it easier to start and run enterprises in order to

provide more and better jobs for young people, and employment creation has to be enhanced placing job creation at the center of the macroeconomic policy. Central to the promotion of economic growth and development is promotion of investment to the real sector of the economy. For this purpose, it is essential to periodically evaluate and revise the incentives provided for investment to redirect the allocation of the available capital to industrial development. The development of micro and small enterprises has to be strengthened, encouraged, and facilitated by the government offices in charge of this responsibility because the sector practically proved to be one of the fundamental solutions to urban youth unemployment in Ethiopia.

Enhancing the labour market information system through investments to improve information resources for youth is essential to avoid the mismatch between skills that educators entrust to their graduates and the skill that the economy requires. In a poorly developed labour market information system, many young people inevitably stumble in their initial career steps due to poor information about the world of work, leading to poor choices about education and careers. High-quality labour market information and career guidance can help youth make better informed decisions about their future including the selection of academic/vocational programs, a decision to complete high school, and an optimal combination of education and work. Thus, it is important to enhance the capacity of the labour market institutions.

# Empowerment and National Fisheries Policy Implementation in Uganda

Joshua Mugambwa, Isaac Nkote Nabeta, Mohamed Ngoma, Nichodemus Rudaheranwa, Will Kaberuka and Chrisostom Munene
Makerere University Business School, Kampala, Uganda

## Synonyms

Enabling policy action; Policy decisions; Policy practice

## Definitions

| | |
|---|---|
| National Fisheries Policy implementation | It refers to putting policy objectives into effect. |
| Structural empowerment | It relates to practices, aimed in obtaining access to structures in the work environment through support, information, and resources, which offer workers opportunities to share in the decision-making processes, increase decision-making authority, and improve execution of policy implementation tasks. |
| Public policy | It is whatever a government chooses to do or even not to do. |
| Policy implementation | It is putting policy decisions into effect. |
| Power | It is the ability to influence others through the possession of knowledge or skills that are useful to others. |

## Background

The National Fisheries Policy (NFP) was adopted in 2004 in Uganda to transform, develop the fishing industry, and ensure sustainable exploitation of the fisheries resources; the NFP implementation is aimed at improving livelihoods and alleviating poverty in fishing communities through sustainable fisheries management. However, the rural areas where fishing takes place constitute 89.3% of national poverty. The NFP implementation is faced with challenges that include increasing encroachment and overfishing leading to declining fish stocks, with resultant poverty among the fishing community, food and nutritional insecurity, job insecurity, and conflicts evident on all major Ugandan lakes. The NFP implementation was decentralized to local governments through Beach Management Units (BMUs). BMUs are legally institutionalized as community institutions with a co-management function to develop, conserve, and sustain the fisheries resources. However, the little impact of

BMUs is evidenced by the fish stock reductions (Kayiso 2009).

The declining fish stocks raise concerns about the incomprehensiveness in the implementation of the National Fisheries Policy in Uganda. Some fish processing factories closed due to lack of fish. Coercion, dominance, and authoritarian power have had marginal contributions. In the process of controlling illegal fishing, people have lost lives. Consequently, this situation has escalated poverty, single mothers, and uneducated children who desperately use illegal means while fishing for survival. It's evident that if power continues to be practiced as authority, coercion, and oppression, the National Fisheries Policy may not achieve its goal of ensuring sustainability of fisheries in Uganda (Mugambwa et al. 2017). The inability to tackle these challenges threatens the sustainability of fisheries given that some communities entirely depend on the fisheries resources for their livelihood. The concern here is how the different forms of empowerment influence the fisheries policy implementation in Uganda. "Kantian empowerment" which includes power, support, and information can facilitate fisheries policy implementation. Technical officers must be trained, informed, and supported. Structural empowerment theory offers an integrative lens through which a better understanding of how empowerment in fisheries can be achieved and used to inform fisheries management that is ecologically and socially sustainable.

The ineffective and incomprehensive implementation of the National Fisheries Policy can be attributed to deficient empowerment. The purpose of this entry is to examine the relevance of structural empowerment in NFP implementation. This entry is built on studies of Neiland (2005) and Bene et al. (2010) who deliberated on the significance of power in the fisheries sector through local co-management in sub-Saharan Africa. However, the previous studies leave a gap of being unelaborate in prescribing the forms of empowerment necessary for fisheries policy implementation. In agreement with Bene et al. (2010), this entry observes that outcomes of decentralized co-management reforms have not been systematically positive. In some developments, local actors advance theirs agendas and promote illegal fishing.

The rest of the entry proceeds as follows; the subsequent section deals with structural empowerment and policy implementation. The entry ends with a conclusion.

## Structural Empowerment and National Fisheries Policy Implementation

Structural empowerment involves the opportunity to do challenging work, the chance to gain new skills and knowledge. Effective structural empowerment includes collective involvement and a supportive environment, which creates a sense of local bonding. Structural empowerment improves institutional decision-making, involvement, and functioning in policy implementation. Structural empowerment therefore facilitates professional practice and explains the direction of policy implementation. Previous studies have concentrated on empowerment in organizations, and little work is on public policy implementation. Education and income are empowering factors. Co-management involves BMU's worked with fisheries officers and local leaders in the management of fisheries. In view of structural empowerment, the technical officers are involved in the NFP implementation through collection of fisheries information, participation in licensing processes, and the development and enforcement of bylaws. This demands having appropriate skills, abilities, and resources to fulfill the obligations (Nunan 2006). Fisheries officers' capacity is built through education and payment, training to strengthen supervision, and advisory support. The fisheries officers with BMU's share information engage in sensitization, supervision, recording catch statistics, and confiscating illegal fishing gear (Onyango 2009).

Fish stocks are considered a common property, which should be exploited exclusively. This has led to unwillingness of fishers to strictly follow rules of engagement causing rampant illegal fishing and fish overexploitation (Onyango 2000). Fisheries co-management in Uganda under the Beach Management Units was weakened by misuse of coercive power and selective application of the law by the regulatory officers including failure to reprimand and prosecute high-level illegality

(Nadiope 2010). The conflictual relations between the coercive law enforcement officers and fishing community have claimed many lives on the water. The local government fisheries management system is characterized by inadequate support, power, information, and resources which have led to laxity and ineffective monitoring of the lake (Muzige 2009). Scholarly works note that empowerment enhances fisheries policy implementation. They have, however, concentrated on BMUs and neglected the local government bureaucrats who are the technical officers that implement policy at the grassroot level.

Studies such as May et al. (2016) give a partial account by disregarding empowerment mechanisms. Other studies are from the developed world. The approach of coercion and authoritarianism toward policy implementation in some of the developing world has had mixed results. The authoritarian approach sometimes backlashes causing loss of lives and fish depletion.

Kanter's structural empowerment theory (SET) (Kanter 1993) informs policy implementation. The SET states that power, support, resources, opportunity, and information are critical structural conditions for empowerment and must be available to employees for success and effectiveness. Power is developed from structural conditions, not from personal characteristics or from socialization effects. However, structural empowerment theory has been used sparingly in policy implementation literature, in spite of its relevance and applicability. The key empowerment factors that influence fisheries policy implementation in Uganda are information, power, support, and resources. These factors are discussed in the following section.

## Information Enables Fisheries Policy Implementation

Information regarding policy implementation target and strategy facilitates and focuses activities that are useful in mobilization of participation. Information relates to knowledge on fisheries policy, decisions, goals, and data. It offers a sense of meaning and purpose and increases the ability of the worker to make decisions and judgments (Laschinger et al. 2014). Information guides policy implementation decisions and clarifies issues such as purpose of the fisheries policy to the destination community. Information further includes knowledge of job roles and responsibilities, policy objectives, and citizen perceptions on policy. Information can be obtained from observation, analyzing events, on media, consultation, and cooperation with key actors. Shared information on policy implementation procedures ensures efficiency and effectiveness. Regular feedback clarifies and improves policy implementation.

Information strengthens understanding and capacity such as fish quality inspection and monitoring, prosecution process, and management. Relevant and timely information is helpful for decision-making. The use of mobile telephones is very significant on the lake since nearly every one owns a mobile phone set. In line with this entry, Onyango (2000) noted that even in the most resource-constrained environments, reliable information to stakeholders guides decision-making and critical to successful implementation. Reliable information may be obtained from expert advice, where a knowledge need is identified and advice obtained. However, many people may claim expertise but without sufficient knowledge of the scientific literature.

## The Role of Power in Fisheries Policy Implementation

Power is described as legal, coercive, remunerative, normative, and expert power. Power is necessary to influence a group or individuals. Power is manifested by policy implementers' control in three domains: control over the content of practice, control over context of practice, and control over competence in fisheries policy implementation practice. Control over content enables policy implementers to practice more professional autonomously. Power is informal and formal. Formal is derived from job activities and allows discretion. Informal power obtained from alliances and external contacts. Formal and informal power systems facilitate empowerment of structures (Nadiope 2010). The fisheries officers are expected to have a professional degree qualification and play a significant role in court cases. Nunan (2006) noted that professionals are most times able to use their professional training that focuses on autonomous practice and independent decision-making.

Control over the context of policy implementation involves participatory decision-making. This creates an empowering environment in view of collegial relationships and ability to influence decisions at the work place. Technocrats have to understand the fishers and their environment to have their opinions taken. So, coping with the fishing environment generates support useful in policy implementation. Power over competence is maintained through knowledge development, which is acquired through education and expertise. Expertise and experience are different, and both needed for success in policy implementation work. They can be obtained from workshops and advice from professionals and experts, which helps to improve understanding. The utilization of expert advice, experience, and retraining enables fisheries officers to deliver in policy implementation work (Onyango 2004). Education preparation provides this form of power.

Coercive power has its constraints. Coercive power arises out of Under the Fish Act which authorizes officers to seize and destroy any vessel and prosecute offenders. Sometimes this power is misused by extortion, destroying boats, and beating culprits without producing them to courts. Coercion leads to death of suspects. The landing sites are intentionally torched to chase away residents. Using coercion, the army that replaced BMUs after abolishing them in 2005 has been able to improve the fish quantity at the expense of people losing lives. While recent reports credit the army for increasing fish variety and quantity, complaints exist concerning the brutal manner in which the operations are carried out (Mutaizibwa 2018).

### Support and Fisheries Policy Implementation

Structural empowerment entails providing support for making and acting on policy decisions. Support enables experimentation with and adoption of new approaches and practices to better meet policy needs and to make important decisions. Support from donor agencies helps to improve landing sites to prepare fish for preservation and export. Similarly, previous studies noted that when actors get supported, they get capacity to implement policy (Kanter 1993). Support in terms of technology, education, and other forms is helpful in adding value, creation of jobs, quality control and marketing, and livelihood sustenance.

## Conclusion

The National Fisheries Policy implementation is characterized by a number of challenges that risk fish extinction in Uganda. This entry concludes that Kanter's structural empowerment is essential to guide policy implementation. Particularly information, support, and power play significant roles in ensuring continuity and putting into effect the fisheries policy in Uganda. Aspects of power such as the control over competence, context, and content can be obtained from relations with actors and institutions. Therefore policy implementers have to be empowered and meaningfully involved in implementation by visiting the landing sites and surveillance of the waters for illegality to gain control over the context (Kanter 1993). Educational preparation and training, payment, visiting of work venues, landing sites, recognition for excellence, expert advice, retraining, and support with modern technology should be done in view of increasing structural empowerment to facilitate policy implementation. The use of force and coercion is destructive in some situations.

## Synonyms

Centralized police system; Government response; People's demand; Sound governance; The media

## Definitions

SARS: Special Anti-Robbery Squad – one of Nigeria Police Force' units created in 1992 to tackle and prevent criminal-related offences such as highway robbery, kidnapping, and armed robbery, among others.

ENDSARS: a sweeping campaign led by Nigerian youths in October 2020, agitating against the operations of the special anti-robbery squad. Allegorically, ENDSARS is a metaphor to end bad governance/leadership in Nigeria.

Social media: these are strong technological platforms of unconventional media such as Facebook, WhatsApp, Instagram, and YouTube, among others, used to advance and give weight to the ENDSARS campaign in Nigeria.

Centralized police system: a system of policing in Nigeria whereby the Nigeria Police Force (NPF) remains the only police authority in the Federal Republic of Nigeria.

Sound governance: this refers to a more comprehensive governance. It has all the quality characteristics of governance that is superior to good governance and is sound technically, professionally, organizationally, managerially, politically, democratically, and economically. Sound governance is also sound in terms of capacity and anticipatory behavior; it is democratic in character, responsive, and competent; and its cultural values are embedded in societal values and structures (Farazmand 2017).

## Introduction

The Nigeria Police Force (NPF) remains the only police authority in the Federal Republic of Nigeria, since the first decade of the nation's independence in 1960. For emphasis sake, this had not always been the case. For example, from 1943 to 1966, there were local police forces in the three regions of the federation, controlled and maintained by respective regional administrations under the Native Authority Ordinance of 1943 (Shyllon 2008). Note that the constitutional conference of 1954 paved the way for a quasi-federal

system of government in Nigeria. At this conference, it was agreed that the Nigeria Police Force should be the only police authority and that the existing local and native police forces should be dissolved or absorbed, if possible, into the Nigeria Police Force (Shyllon 2008). Nevertheless, the dissolution was never carried out in spite of coming into operation of the 1954 Constitution. It was not until 1966 when the first coup d'état took place that the then government of Aguiyi-Ironsi decreed that all local police forces and native authority police forces should be placed under the overall command of the Inspector-General of Police (Tamuno 1970).

Be that as it may, the complete absorption of the local police forces into the NPF was finally completed between 1967 and 1969 (Jemibewon 1978), maybe as a result of the Nigerian Civil War (1967–1970). At this juncture, the long journey into a centralized police system in Nigeria commenced amidst the presence of federal structure, at least on paper. One of the Nigeria Police Force' units, Special Anti-Robbery Squad (SARS), created in 1992 to tackle and prevent criminal-related offences ranging from highway robbery, kidnapping, armed robbery, etc. recently became notorious in her conduct of operation. The SARS' unruly behavior to Nigerian citizens reached its crescendo in the year 2020. It was their assault, extrajudicial killings, extortion, unlawful arrest, and detention of innocent citizens that resulted to the ENDSARS protest of October 2020.

## Origins

The Special Anti-Robbery Squad (SARS) was a branch of the Nigeria Police Force under the State Criminal Investigation and Intelligence Department (SCIID). It was founded in late 1992 as 1 of the 14 units in the Force Criminal Investigation and Intelligence Department, which was established to detain, investigate, and prosecute people involved in crimes like armed robbery, kidnapping, and other violent crimes (Paquette 2020). The squad was created as a masked police unit to perform undercover operations against violent crimes like armed robbery, car snatching, kidnapping, cattle rustling, and the bearing and use of illegal firearms (Projectstore 2020).

The Nigeria police's Special Anti-Robbery Squad (SARS) has been accused of unlawful arrests, the invasion of youth's privacy by searching phones and laptops, "kidnapping," rape, humiliation, extortion, and extrajudicial killings of their victims. To validate the above viewpoint, Kelechi Madu, Canada's first black Minister of Justice and Solicitor-General at Government of Alberta, recently gave a detailed account on how the Nigerian police allegedly murdered his cousin – Chrisantus Nwabueze Korie – in 2013 (Ikeji 2020). He went on to reveal how the police did everything to obstruct the investigation into the murder incident. Aside this gut-wrenching incident, so many painful experiences encountered by so many Nigerians in the hands of SARS were shared on various news outlets, particularly the social media platforms which are quite efficient in disseminating news contents with speed and heightening tension (Ekwunife et al. 2020). Nevertheless, the Nigerian government paid a deaf ear and did absolutely nothing to stop this. This resulted in a violent protest in Nigeria in October 2020 which led to the banning of SARS on the 11th day of October, after days of protest.

Amnesty International has accused the SARS officials of regularly detaining young male Nigerians illegally and extorting money from their relatives. In 2016, a human rights activist, Segun Awosanya popularly known as *Segalink*, started ENDSARS campaign on Twitter prompting police authority to announce reform of the police unit, but nothing tangible was achieved at the time. In 2018, Nigerian rapper Michael Ugochukwu Stephens professionally known Ruggedman joined the campaign to end police brutality by releasing a single titled *Is Police Your Friend?* In 2017, a petition signed by 10,195 people was submitted to Nigeria's National Assembly calling for a total disbandment of SARS (Ibrahim 2017). Not minding that a few senators backed the call for total disbandment of the unit (Busari 2017), consideration was given to reforming the force, rather than full disbandment due to the number of cases falling (Salaudeen 2017a, b).

The campaigners moved from social media using the #ENDSARS# hashtag to organize peaceful protest in Abuja, Lagos, Ibadan, Osun, Benin, Ughelli, Warri, Ilorin, Ogbomosho, Owerri, Jos, Kaduna, Calabar (Bellanaija 2017), and other Nigerian cities and states, threatening to continue if the federal government refused to disband the force (BBC Pidgin 2017; Wayback Machine 2020b). Not only were there campaigners in Nigeria utilizing the hashtag and having protest, but they were also done in London and some parts of America recognizing this situation as a global event. In response to the campaign, Nigeria Police Force Public Relations Officer Jimoh Moshood apparently accused the campaigners of being "criminals" (Erunke 2018). Despite this, Inspector General of Nigeria Police Force, Ibrahim K. Idris, ordered the reform and reorganization of SARS (Adewole 2018).

On Saturday, October 3, 2020, a video showing a SARS police officer shooting a young Nigerian in front of Wetland Hotel, Ughelli, in Delta State trended on the Internet. It was alleged that the police officers took away the young man's vehicle – a brand of Lexus sports utility vehicle (SUV) (Aljazeera Media Network 2020). The trending video caused public outcry on social media, especially on Twitter, with the #ENDSARS# hashtag trending (Okon 2020). Just as the ENDSARS trend began on Twitter, on Monday, October 5, 2020, another report surfaced of SARS officers killing a 20-year-old upcoming musician named Daniel Chibuike, popularly called Sleek in his neighborhood (Lambo 2020). Sleek was said to be sitting in front of a hotel with a friend when the SARS officers approached them, prompting them to flee. According to an eyewitness, the SARS men pursued the pair, shouting "thief," before shooting Sleek as they ran through a supermarket. His friend was arrested and detained as well (Punch Newspaper 2020a).

On Thursday, October 8, 2020, a nationwide protest on ENDSARS gained momentum after weeks of outrage and anger with videos and pictures showing police brutality, harassment, and extortion in Nigeria. The protest was led predominantly by young Nigerians in different cities alongside many activists and celebrities (Busari et al. 2020a, b). As usual, Nigeria Police Force disrupted the protest in some cities, throwing teargas, using water cannons, and shooting at unarmed peaceful protesters as seen in Abuja and Osun (BBC News 2020a, b, c). For instance, this led to the death of Jimoh Isiaq in Ogbomoso, Oyo State (Reuters 2020; BBC News 2020a, b, c). Eleven days after, by Wednesday, October 14, 2020, precisely, the ENDSARS protest was still ongoing with young people in different parts of Nigeria intensifying their calls for reforms and accountability in police operations (Aljazeera 2020a, b).

## The People's Demands

The protesters had refused to back down from their protest, insisting on some demands, and until they were met, they would continue with their protest. Below are some of the demands listed for the Nigerian government to actualize:

(a) Justice for all deceased victims of police brutality and compensation to their families
(b) The immediate release of all arrested protesters in Nigeria
(c) Setting up an independent panel of inquiry within 10 days that would oversee the investigation and prosecution of all reports of police misconduct in Nigeria
(d) In line with the Police Act, the need for psychological evaluation and retraining of all disbanded SARS officers before they are reassigned to other units
(e) And finally, adequately increasing their wages (Vanguard News 2020a).

ENDSARS is a decentralized social movement and a series of mass protest against police brutality in Nigeria. The slogan calls for the disbanding of the Special Anti-Robbery Squad (SARS), a "notorious" unit of the Nigerian Police with a long record of abuses (Vanguard Newspaper 2018). The protest which takes its name from the slogan started in 2017 as a Twitter campaign using the hashtag #ENDSARS# to demand the disbanding of the unit by the Nigerian

government (Salaudeen 2017a, b; Thisday Newspaper 2017). After experiencing a revitalization in October 2020 following more revelations of the abuses of the unit, mass demonstrations occurred throughout the major cities of Nigeria, accompanied by vociferous outrage on social media platforms. Also, solidarity protest and demonstrations by Nigerians in diaspora and sympathizers occurred in many major cities of the world. The protest is notable for its patronage by a demography that is made of entirely young Nigerian populace (Busari 2020). The movement has since expanded to include demands for sound governance, transparent accountability, and genuine representation from the present government. Sound governance as demanded by Nigerians is in tandem with the idea of Farazmand (2017); hence, "a more comprehensive governance that includes the normative as well as technical and rational features of good governance presents a balanced view of governance that is less biased and takes into consideration the genuine features of indigenous governance systems that may be at odd or conflict with the globally dominant neocolonialist power structures. It has all the quality characteristics of governance that is superior to good governance and is sound technically, professionally, organizationally, managerially, politically, democratically, and economically. Sound governance is also sound in terms of capacity and anticipatory behavior; it is democratic in character, responsive, and competent; and its cultural values are embedded in societal values and structures."

Within few days of renewed protest, on October 11, 2020, the Nigerian Police Force announced that it was dissolving the unit with immediate effect. The move was widely received as a triumph of the demonstrations (Aljazeera 2020a, b). However, it was noted in many quarters that similar announcements had been made in recent years to pacify the public without the unit actually being disbanded and that the government had merely planned to reassign and review SARS officers to medical centers rather than disband the unit entirely (Ademoroti 2020). Protests have continued accordingly, and the Nigerian government has maintained a pattern of violent repression including the killing of demonstrators (Premium Times 2020). There have been international demonstrations in solidarity with those happenings in the country, and the movement has also grown increasingly critical of President Muhammadu Buhari's led government response to the protest (Makinde 2020).

Contrary to the fiat setting up its modus operandi, SARS officers have been alleged to profile young Nigerians, mostly males, based on fashion choices, wearing tattoos on their body, and putting on hairstyles that may not appear conventional for male folks, especially young boys. They were also known to mount illegal road blocks, conduct unwarranted stop-and-search, arrest and detain without warrant or trial, rape women, and extort young male Nigerians for driving exotic vehicles and using laptops and expensive phones such as iPhones (Kazeem 2020). Nigerians have shared both stories and video evidence of how officers of SARS engaged in extrajudicial murder, theft, rape, torture, unlawful arrests, humiliation, unlawful detention and extortion of Nigerian citizens, and sexual harassment of women and brutalizing of young male Nigerians. The human rights abuses were documented in trending videos on social media (Ujene and Orji-Egwu 2018). Regrettably, a large section of the victims of the abuses of SARS has been young male Nigerians (Wayback Machine 2020a). In some instances, the SARS operatives of the Nigerian Police Force have been accused of kidnapping too.

A 2016 report by Amnesty International indicted SARS by maintaining that the squad was responsible for human rights abuses, cruelty, degrading treatment of Nigerians in their custody, and other widespread torture. Some of the human rights abuses by SARS include the shooting of their detainees in the leg, mock executions and threats of execution, hanging, and physical assault (Salaudeen 2018). In 2017, Nigerian activists, youth, and celebrities across the nation took to the streets in a peaceful protest to spread awareness of SARS brutality and extortions and to demand its disbanding. The protest also moved to social media using the hashtag #ENDSARS (Ogundipe 2017a, b; Adebayo 2020).

## Government Response to the ENDSARS Protest

In response to the public outcry on police brutality, the Inspector-General of Nigeria Police made an official announcement by restraining the SARS, Special Tactical Squad (STS), Intelligence Response Team (IRT), Anti-Cultism Squad, and other tactical units from mounting of roadblocks, checkpoints, stop-and-search, and other routines and patrol operations. Similar actions taken against their operatives had been announced multiple times over the previous 4 years, causing citizens of Nigeria to question whether the order would actually be upheld. There were further reports of SARS officers involved in killings across the country (Ifeoluwa et al. 2020). As this was the fourth time that the Nigerian government had announced a similar measure on SARS illegal activity (Kazeem 2020), protesters insisted that the notorious police unit be entirely disbanded and wide-ranging reform of the force to follow suit (Punch Newspaper 2020a).

## Imposition of Curfew and Deployment of Security Agents

On the 20th day of October 2020, the "Lekki Tollgate Massacre" occurred. Following violent escalations which included attacks by agitators against both protesters and police, the Governor of Lagos State, Babajide Sanwo-Olu, declared a state-wide 24-h curfew, effective from 4:00 PM WAT on October 20. During this time, images of some persons alleged to be working with the Lagos State Government and the Lekki Concession Company (LCC) removing cameras (later confirmed by the Lagos State Government to be laser cameras and not CCTV cameras as earlier publicized on social media) (Vanguard 2020b) at the tollgate circulated on ENDSARS on Twitter, and street lights at the tollgate vicinity were turned off. A few hours later, it was reported that armed men of the Nigerian Army arrived at the scene of the protest and opened fire on peaceful and unarmed protesters, thereby resulting in a disputed number of deaths. A clip of the shooting videoed by a brave Nigerian youth, DJ Switch, trended on the Internet showing how live rounds of bullets were being shot at innocent protesters who crouched on the ground, holding hands together and singing the Nigerian national anthem. There were also reports that at least 50 other people were injured. However, the Lagos State Government later reported that the shooting resulted in up to 25 injured and only 2 dead (Premium Times 2020). Despite the fact that the curfew was extended till 9:00 PM, soldiers of the Nigerian Army started shooting before 7:00 PM (The African Media 2020; Amnesty Organisation 2020).

Following the killings on October 20, video evidence showed that more shootings were still being carried out by the Nigerian Army and the Nigerian Police on the unarmed protesters. Some people also attacked and burned buildings, vehicles, and TV stations and raided the Oba of Lagos' palace (BBC News 2020a). The Governor of Lagos had said that there were no casualties from the incident of the previous day but later tweeted that there had been reports of one casualty which negated the report sent in by various citizen journalists who had live recordings of the killings on Twitter and Instagram. While the protesters gathered again at the Lekki tollgate where the shooting took place on Tuesday, October 20, they were forced out by police (BBC News 2020a). As the protesters defied curfew imposed by the Governor of Lagos State, hoodlums burned about 30 government buses at a bus station. Also burned was Television Continental Station (TVC) whose ownership was linked to a former governor of the state, Bola Ahmed Tinubu, who is a national leader of the ruling All Progressives Congress (APC) (Aljazeera 2020b). About seven people were reportedly killed within 24 h since soldiers opened fire at protesters in Lagos. Authorities did not deny carrying out a crackdown but refused to accept the number of deaths (casualties) as at October 21, 2020. Brutality by the police forces made the protesters angrier on intensifying the scale of the protest (The Guardian Newswpaper 2020).

On Thursday, October 22, it was reported that armed men began shooting at protesters at Oyigbo

(Obigbo) in Port Harcourt. The attackers began breaking into homes, murdering the occupants, and afterward, torching down property. It has been rumored the shooters were Fulani herdsmen contracted by the government to disrupt the protest, but there is no clear verification for this claim yet.

## Central Bank of Nigeria and ENDSARS Protesters' Bank Accounts

On Tuesday, October 20, 2020, the Central Bank of Nigeria obtained an ex parte motion to freeze the accounts of notable participants in the ENDSARS protest. In an exclusive report by Peoples Gazette, court documents showed that the Central Bank of Nigeria failed to give any justification for the freezing order. Twenty protesters banking with Access Bank plc, Fidelity Bank Nigeria, First Bank of Nigeria, Guaranty Trust Bank, United Bank for Africa, and Zenith Bank had all accounts linked to them placed under "post no debit" (Punch Newspaper 2020b).

## International Dimension of the Protest

International protests were organized by the Nigerian diaspora in Europe, the Americas, Oceania, and elsewhere in Africa (Pulse Nigeria October 12 2020). Many Nigerians and Nigerian diaspora celebrities gave supportive statements on social media and took part in protest, while demonstrators pledged to continue until the demands were met (Goal.com 2020).

### Social Media

On the 9th of October 2020, the #ENDSARS# hashtag trended globally on social media. ENDSARS protest, which started on the 8th of October 2020, was still ongoing in major cities across the country and has attracted international mainstream media attention. The campaign has witnessed reactions on social media from international celebrities such as Cardi B, Rihanna, Trey Songz, Big Sean, Jidenna, John Boyega, Kanye West, Drake, Diddy, and Lewis Hamilton, among others, including footballers Marcus Rashford, Odion Ighalo, and Mesut Ozil (BET 2020). Upon hearing the news that SARS had been disbanded, Nigerians took it with a grain of salt and carried on with pressing their demands for total disengagement of the unit and for wide-ranging reform of the force. The hashtag on social media changed from #ENDSARS to #SARSMustEnd! With the announcement of a new unit styled Special Weapons and Tactics Team (SWAT) by the Nigerian Police to replace SARS, the hashtag for the protest quickly changed to #EndSWAT on Twitter (Channels Television 2020), and this #EndSWAT also trended on social media (Trends24 2020). On Thursday the 15th of October 2020, Google Africa made a statement on its Twitter handle in support of the ENDSARS protest going on in Nigeria by condemning police intimidation, oppression, and brutality while urging the government to speedily intervene and resolve the crisis as soon as practicable (Nwosu 2020).

## Celebrity Actions

Many celebrities and Black Lives Matter activists have now written and signed letters directed to President Buhari by demanding justice over the treatment of Nigerian people during the protest, in regards to police brutality. In the letter, they urged President Buhari to free detained protesters, and this letter was organized by the Black Lives Matter cofounder Opal Tometi. The letter was signed by the likes of Alicia Keys, Donald Glover, Mark Ruffalo, Kerry Washington (notable celebrities), and writers such as Reni Eddo-Lodge, Naomi Klein, and Afua Hirsch. It was also signed by a notable activist called Greta Thunberg.

## ENDSARS Protest: Success or Failure?

The ENDSARS movement began back in 2017. But in a matter of a few weeks, the hashtag #ENDSARS has been spread worldwide in October 2020 by both the mainstream and the social media, and this attracted the attentions of

international and local celebrities such as Beyoncé, Rihanna, Lil Nas X, and Nigerian superstar Burna Boy. But the hashtag's origins and widespread use actually date back to 2017. The Special Anti-Robbery Squad itself has existed since 1992 with the intention of combatting violent crimes. In the ensuing decades, many accusations of police brutality have been levied against its officers, who have faced minimal repercussions.

According to *The New York Times* (October 14 2020), the catalyst for the October 2020 protest was the death of a young man during "a stop-and-search operation," which the cops have said didn't involve SARS officers. The protest escalated and turned violent in October 2020. Citizen protest started toward the beginning of October, with *Al Jazeera* (October 9 2020) revealing that "thousands of people took to the streets" on October 13. As the protest continued, the national governments responded by calling in riot police, while the Lagos State Governor instituted an assumed harsh 24-h curfew.

October 11 saw the announcement of SARS being disbanded and replaced with a new force trained by the International Committee of the Red Cross (ICRC), but protest has continued as the public demands more meaningful reform to the nation's police and expresses skepticism that what has been promised will actually create a safer environment for Nigerians, if implemented. As the protest stretched on, the police and government's responses have turned increasingly violent against the peaceful protesters. On October 20, reports said that soldiers began shooting at protesters in Lagos, and though the numbers are unconfirmed, it was reported that people were wounded and killed. For instance, an anonymous officer speaking to *The New York Times* (October 7 2020) said the death toll was 11.

An investigation by Amnesty International (October 14, 2020), which has been following the #ENDSARS protest closely since October 8, led the organization to declare that "the Nigerian army and police killed at least 12 peaceful protesters in October 20 at two locations in Lagos." The report also said that thousands were peacefully protesting when the shooting began, that there was no warning before they began firing, and that CCTV cameras "were removed by government officials." #ENDSARS demonstrations in Nigeria took a violent turn today when authorities opened fire on peaceful protesters in Lagos after the city's governor imposed a curfew to quell ongoing demonstrations. The Amnesty International condemned these violent acts against peaceful protesters and stood in solidarity with the people of Nigeria.

The protest may have been unsuccessful, this is because the Nigerian government has promised reform, but many are skeptical due to its history of inaction and policy inconsistency on police reform. Though the SARS unit was ended on October 11, many are skeptical that President Muhammadu Buhari and his administration will take meaningful steps toward reform and holding former SARS officers accountable to their deed while active in the unit.

According to *Al Jazeera* (October 9 2020), a new unit – Special Weapons and Tactics (SWAT) – has already been formed with the intention of replacing SARS, leading some to believe it will carry out same actions under a different name. This is seen as consistent with the Nigerian government's actions they have reportedly claimed in the past to be reforming SARS but ended up with little or no concrete improvement to show for it.

Agencies such as Amnesty International Nigeria on October 14 2020 have laid out the reform steps that must be taken by the government and police force. For example:

> The Nigerian authorities must go beyond lip service to ensure there is real reform within the Nigeria Police Force with an emphasis on SARS. These reforms must translate into holding police officers suspected of torture to account, ending torture, unlawful detention, extortion, extrajudicial execution and other human rights violations that SARS officers have been known for across Nigeria

## Argument for or Against the ENDSARS Protest

Many Nigerians are in support of the protest because the NPF needs to be restructured for obvious reasons (Egbunike 2020). The voice of Nigerians is of the view that the entire NPF needs

to be reformed entirely, seeing this as the only way to eradicate the rot in the system and institute sound governance, not only in the SARS unit. It goes beyond the latter. Allegorically, the ENDSARS protest is an agitation against bad government in Nigeria. In some quarters, SARS was interpreted to mean "Senators And Reps Salaries," hence calling on the federal government to stop the huge salaries of Nigerian senators and members of House of Representatives which are acclaimed to be the highest in the world. Nigerians need the right people at the realm of powers – activists, celebrities, and the international community to get involved – for this reform to become a long-lasting reality. Thus, the protesters and the government should have a round table discussion and begin to iron out these demands and also place stringent laws against police brutality which should be enacted into law as this will forestall future occurrence.

## Conclusion

This entry contends that the highly centralized Nigeria Police Force was a major problem that gave rise and backing to the unruly behavior of its operative unit – SARS, hence the need for immediate decentralization of the police force in Nigeria. With this, the federating units should be able to establish its police system that would be answerable to the governors and the federating unit. Also, the unprofessional conduct of its unit, SARS operatives, would be properly monitored and restricted to a minimal level. The ENDSARS protest could not be said to be a failure (unsuccessful) at the end. For instance, it took just a few days for the Nigerian youths to organize food, legal aid line, and alternative charging points for phones and laptops. In addition, a lady with a single limb amputation got a prosthetic leg worth 1.6 million naira in less than 24 h and a helpline for protesters. One can imagine what will happen if the right people take up the mantle of leadership in Nigeria. Indeed, nations fail because of bad leadership.

Indeed, what the world witnessed was the anguish experienced by most Nigerians but rather suppressed due to fear of harassment, imprisonment, intimidation, and marginalization, among others, from the government of the federation who has the sole control of the entire police force in Nigeria. However, there is a paradigm shift from the old era filled with fear to a new era of fearless Nigerians: Nigerians that speak out against bad governance, injustice, police brutality, and oppression and call out for a just system that will tackle crimes and criminalities in the society within the ambits of law while at the same time treat everyone with respect and dignity.

To sum it up, the ENDSARS protest could be likened to an uprising that failed to materialize into a revolution at the end. This is because the government at the center is in full control of the entire police force in Nigeria, hence, in a position to give the first and last order at will. Be that as it may, for the first time in many decades, Nigerians spoke!

# Enhance Public Value to Rescue Civilization

Ken Coghill
Swinburne University of Technology, Hawthorn, VIC, Australia

## Synonyms

Civilization; Commoning; Commons; Constitution; Court; Fiduciary duty; Humanity; Public officer; Public official; Public trust doctrine; Public trust principle; Social value; Systems approach

## Definition

Public value creation is essential to address the existential threat to civilization posed by climate change. Its creation relies on a systems approach that increasingly incorporates constitutional principles including the entrusted responsibilities of elected and appointed public officers.

## Introduction

This entry examines the remediation of public value to address the threat posed by climate change. The threat requires society to recognize anthropogenic factors forcing the change and to take mitigating and adaptive actions. Such actions are manifestations of "the development and implementation of public policy," which creates public value (Brown et al. 2019), either at local or larger scale.

Those actions are subject to principles that are important to define and understand public value, public officers, fiduciary duty, the commons, as now explained.

Public value, popularized by Mark Moore, is described by ANZSOG by:

> . . . who consumes it, and how. Public value is consumed collectively by the citizenry rather than individually by clients or customers. It includes things that economists call 'public goods' which are 'jointly consumed', 'non-rivalrous', and 'non-excludable'. This means that one person can consume them without reducing their availability to another person, and also that nobody is excluded from consuming them – like public parks, clean air, and national defence.
>
> But it also includes remedies to market failure – that is, to situations where market mechanisms don't maximise citizens' individual welfare, such as negative externalities, natural monopolies, or imperfect information. At the same time, the institutional arrangements that enable markets to operate and society to function in an orderly way can also be seen as publicly valuable. Most basic is the rule of law, which not only provides security to citizens but also underpins the market, by enforcing property rights and contracts through the police, courts and prisons (ANZSOG 2017).

Public value is a public good, corresponding with the polity's shared interests. In the context of climate change, public value includes public policies that are effective in the maintenance of an environment in which humanity can at least survive, if not thrive. Public value arises through a strategic triangle comprising: (1) the authorizing environment that provides legitimacy and support; (2) productive capabilities (both internal and external); and (3) value (both public and private) (ANZSOG 2017). It is created through the mobilization of resources managed by public officers or resources, external to the entity, which it recruits, contracts or otherwise engages in the task (Koolma and van Dreven 2019). These may include the exercise of corporate social responsibility (CSR) by non-state actors (Fisher and Grant 2012).

## Systems Approach

Coffey's much more holistic approach to public value is consistent with the complex evolving systems understanding of the policy environment within which public value exists. While in democracies the state sector has a monopoly on the legitimate exercise of coercive and regulatory powers, the social system's outcomes are subject to interdependence and interactions between state, market and civil society actors.

More broadly, the social system is a subsystem of the Earth's larger ecological system. However, a "focus on integration rather than balance" (Coffey cited in Brown et al. 2019) can be challenged as a somewhat misleading dichotomy. What is the balance between survival and death, in this case of the social system?

Public officers are individuals authorized to exercise public powers by appointment to an "office of trust concerning the public . . . by whomever and in whatsoever way the officer is appointed" (R v Bembridge 1783). This includes "the obligations and duties of those elected or appointed to public office – that is, members of parliament, officials and others who discharge public duties" (Solomon 2018).

Fiduciary duties are "standards of conduct properly to be expected of persons occupying fiduciary positions, i.e. persons who, by virtue of position, responsibility or function, were expected to act in another's interests and not in their own interests" (Finn 2012, p. 31).

Public officers have a fiduciary duty to act in the best interests of the people affected. In a parliamentary system, this derives from members of parliament having "a fiduciary relation towards the public" (R v Boston 1923). This relationship extends to members of the Executive who are parliamentarians and to a person appointed to public office as falling under the responsibility of a member of the Executive.

The public trust principle (public trust doctrine in USA) is a key legitimacy and support component of the authorizing environment. It provides that a public officer "undertakes and has imposed upon him a public duty and a public trust" (R v Boston 1923), that is, public officers are entrusted with responsibility to act in the common good of the entire polity.

In this discussion, the atmosphere is a fundamental component of the public trust and, it is argued, public officers as trustees have a common law, normative obligation to protect it in the interest of humanity, in all polities.

The commons perspective treats the public trust as a commons:

> the commons is . . . a natural or manmade resource that can be shared as a common-pool resource. However, its definition is more complex depending on the resource and associated sharing system. More importantly, is to think of the commons as a process—of negotiating relations and physical resources—that is composed of (a) the common-pool resource and (b) the act of commoning (Newcomb 2016; Inter-national Association for the Study of the Commons (IASC)).

Here, public value is the commons – a manmade common pool resource – and the creation of public value is the act of commoning.

The things that are treated as a commons vary between polities. Craig has drawn attention to the variations between the 19 western states of USA. Focusing on water resources, she identifies

> . . . four factors (that) have been most important in the evolution of state public trust doctrines: (1) the severing of water rights from real property ownership and the riparian rights doctrine; (2) subsequent state declarations of public ownership of fresh water; (3) clear and explicit perceptions of shortages of water, submerged lands, and environmental amenities; and (4) a willingness to raise water and other environmental issues to constitutional status and/or to incorporate broad public trust mandates into statutes.

She notes the "expansion of public trust concepts into ecological public trust doctrines that are increasingly protecting species, ecosystems and the public values that they provide" (Craig 2010). This is highly relevant to addressing climate change.

Currently, however, there are major differences between jurisdictions as to the manner and extent to which public officers can be held to account for the discharge of their fiduciary duty and their entrusted responsibilities under the public trust principle. These differences are in turn relevant to the approaches of public officers to public value and are becoming increasingly acute as the existential threats posed by climate change become starker.

It is starkly obvious that humanity's economic model is forcing damaging change to the Earth's ecological system, which paradoxically is posing an existential threat to civilization (United Nations 2019). The social system is not sustainably integrated into the ecological system upon which humanity is dependent. The requisite public value is not being created by humanity's poorly integrated authorizing environment.

## Redirecting

The creation of public value must be re-orientated to a fully integrated focus, privileging environmental outcomes concurrently with economic and social reforms.

Pressures to extend the public value commons through interpretations of the ecological public trust are being observed at global, international, national and subnational levels of governance and jurisprudence. Exemplars are now discussed.

### Global

International developments indicate an emerging global commons, consistent with argument advocated by Edenhofer et al. (2012). The Paris Agreement on Climate Change was a recognition by virtually all national leaders that, as public officers, they had a duty to commit to the Agreement in the best interests of their polities.

Although the Agreement is inadequate to keep global warming below the 1.5 °C threshold, it does provide mechanisms – commoning – for periodic reports and negotiated changes.

Many multinational agreements aim to create public value but the focus of public value is most often the national and sub-national public sector. Selected cases are reflective of the complexity of the adaptive systems that typify contemporary nation states, including tensions in the dynamic relationships between the Executive and Judicial branches. Each nation state has unique constitutional structures, institutions and governmental practices and learns from each other and adapts their domestic policies and practices.

## Country Cases

Atmospheric trust litigation (ATL) in USA directly aims to establish the public trust doctrine for protection of the atmosphere (Wood 2012). Litigation by young people in every state of USA and Federal courts argued (1) that as a consequence of actions of government agencies (e.g., approval and/or permitting gas extraction) emissions are causing harms and/or (2) the public trust doctrine imposes an obligation on government (i.e., public officers) to act to maintain a safe environment (i.e., curb climate change).

The US Ninth Circuit Court of Appeals ruled that the case should not go to full trial by the Court. The majority's reluctance to allow the case and the powerfully argued dissent from the majority by one of the Court's panels may indicate the potential for a majority of different judges to come to support such a case.

There have been remarkable successes in some US state courts, for example, a Massachusetts

Supreme Judicial Court decision led the Governor to issue an Executive Order requiring:

> . . . the Secretary of Energy and Environmental Affairs to prepare and implement a "comprehensive energy plan" within two years and the Department of Environmental Protection to promulgate regulations establishing annual reduction in Massachusetts' greenhouse gas emissions no later than August 11, 2017. (Our Children's Trust 2020)

A Netherlands Supreme court decision (2018) was much stronger. It required the government to implement its own official policy and its treaty obligations "to slash greenhouse gases by at least 25 percent by 2020" (Kemp 2018). The judgement was based on the UN Climate Convention (i.e., United Nations Framework Convention on Climate Change (UNFCCC)) and on the Dutch State's legal duties to protect the life and well-being of citizens in the Netherlands. Public officers have responsibilities to uphold the public trust. No nation could escape acting because of its small contribution to global warming (Netherlands Supreme Court 2020).

The French case has some parallels with the Netherlands case. In November 2020, France's Conseil d'Etat (Council of State) imposed an obligation on the French State to implement concrete and effective measures to achieve its climate action goals (Dikov 2019; France24 2019). A preliminary judgement, in which "the government (was) given three months to demonstrate that sufficient action is being taken to achieve (France's Paris Agreement) climate goals" was confirmed by a later decision (Conseil d'Etat 2020; Reuters Staff (2021).

Iceland demonstrated a different form of accountability for responsibility entrusted to a public officer. Iceland's **landsdóm** court found the Prime Minister negligent in his failure to keep his Government Cabinet informed in responding to the tumult in financial markets as that instability afflicted Iceland's management of its economy (Werdigier 2012). That guilty finding demonstrated the potential for a most senior public officer to be prosecuted successfully for breaching an entrusted responsibility.

An Australian State of New South Wales Court refused an appeal against a 2017 decision by the responsible State Government Minister (in the conservative coalition ministry; a public officer). He had refused approval of a proposed mine for coal exports. In upholding the Minister's refusal, the judge stated:

> In short, an open cut coal mine in this part of the Gloucester valley would be in the wrong place at the wrong time.
>
> . . .
>
> Wrong time because the greenhouse gas emissions (GHG) of the coal mine and its product will increase global total concentrations of GHGs at a time when what is now urgently needed, in order to meet generally agreed climate targets, is a rapid and deep decrease in GHG emissions (Preston 2019).

The NSW Court decision recognized that the atmosphere is a commons. Furthermore, it referred to the "generally agreed climate targets," that is, 2015 Paris Agreement.

The case highlights the potential for conflict within a federation between national and sub-national authorizing environments. The conservative coalition state government actively pursued enhancement of public value relevant to climate policy. However, the national government, comprised of the same coalition of conservative political parties, has demonstrably resisted such development of public value.

## Barriers to Creating Public Value

What is to be learnt from the features and limitations observed in these instances of public value? The barriers we identify are largely the weakness or absence of institutions or processes which enable the creation of public value are shown in Table 1.

These illustrative cases occurred in countries with strong rule of law custom and practice. They relied on acceptance by public officers that they owe a fiduciary duty and that they are responsible for a public trust. This exposes the fragility of the Paris Agreement – predicated on voluntary targets and compliance. Consequently, measures to impose compliance on recalcitrant states are emerging, for example, carbon border adjustment taxes (European Commission 2020; Mitchell 2020).

**Enhance Public Value to Rescue Civilization, Table 1** Public value enablers and barriers

| | Court empowered to "discover" grounds to enforce creation/ enhancement of public value | Creation/ enhancement of public value enforced by peer mechanism | Creation/ enhancement of public value by compliance with voluntary targets | Barriers to creation/ enhancement of public value |
|---|---|---|---|---|
| Global (Paris Agreement) | No | No | ✓ | Public officers remain in control of creation/ enhancement of public value |
| Multinational (Open Government Partnership) | No | ✓ | | Public officers remain in control of creation/ enhancement of public value |
| USA (Federal; States) | Pending; varies | No | | Policies of President and members of Congress until the Biden-Harris presidency |
| France | ✓ | No | | Resistance by public protestors |
| Netherlands | ✓ | No | | Court limited to enforcement of declared policy |
| Iceland | ✓ | No | | Court's limited view of responsibilities of public officer |
| NSW, Australia | ✓ | No | | Public officers may use legislative powers to override |

Three major problems with the creation of public value have been identified by Fukumoto and Bozeman (2018), namely, the identification problem, the motivation problem and the instrument problem. Barriers to action on climate change illustrate each problem.

The identification problem is readily addressed. As discussed above, international law and in some nations domestic law obliges public officers to sustain a healthy environment, but challenges to scientific knowledge by vociferous minorities remain a barrier that inhibits the creation of effective public value. In this case, the public interest and public value are informed and formed by political, scientific and civil society processes ranging from research and debate to public demonstrations.

The motivation problem is starkly illustrated by climate change public value. The authorizing environment is dominated by public officers variously motivated by (1) addressing immediate preferences or needs, (2) short-medium term perspectives (until the next election), or (3) looking at least a generation ahead. These motivation-related barriers to public value relate to distortions in power relations such that public value is diverted away from equitable outcomes. They can only be reconciled by peaceful, equitable democratic processes, particularly within the authorizing environment.

The instrument problem concerns the means of achieving public value. A common feature of the instances examined is the rule of law. Each relied upon submitting to and accepting the decision made according to law by a legal forum, as a fundamental arm of a democratic system of government. Economic factors are potential barriers, for example the loss of export income and associated employment if a coal mine is closed or potential for foregoing the same if approval is refused for

a new mine. Overcoming such barriers to public value requires instruments and norms through which public value can be sustained and enhanced.

A democratic political system, associated with the rule of law and supported by social and relational factors including norms of stewardship, trusteeship and fiduciary duty, is necessary to ensure the better creation of public value.

## Conclusion: Creating Public Value to Avert Existential Threat

Addressing the emergent existential threat of climate change requires the creation and enhancement of public value in the form of a sustaining and sustainable physical environment. However, as the above cases have demonstrated, there may be barriers to the creation and sustenance of adequate public value.

Four interactive, principal factors may facilitate barriers towards more effective public value creation to resolve the existential threat. These are: (1) rule of law; (2) judicial recognition of the public trust principle; (3) prosecution of breaches of the public trust principle; and (4) normative acceptance that every country shares responsibility notwithstanding limited emissions.

### Rule of Law

In each case, the creation of public value, or resistance to that, was unquestionably subject to subservience to a set of rules – laws – as to how public value is created and interpreted. The rule of law is generally accepted as a prerequisite for the effective creation and maintenance of public value.

The Netherlands case rested heavily on law arising from treaties into which the Dutch state had entered. Rule of law obliged the Netherlands Executive to apply the treaties' provisions domestically.

The French case has been resolved on domestic constitutional provisions and on law arising from treaties.

Iceland's Prime Minister was found to have broken domestic law, as discussed below.

### Public Trust Principle

Until 2021, resistance to the application of public trust doctrine to the atmosphere is clearly a major barrier to the creation of public value in the USA at the national level. ATL has been vigorously opposed. However, the Dutch case demonstrates that resistance by the Executive can be held to breach the principle and can be reversed by the Judicial Branch. The French litigation is based on a similar premise.

### Prosecution of Executive Branch Public Officers

The subsequent prosecution and conviction of the Icelandic Prime Minister for failure to uphold the public trust while in office broke with long-standing custom and practice that such behavior was beyond the reach of the law. Although convicted, the token penalty imposed by the landsdóm reflected the reluctance of prosecutors to pursue such cases.

However, it may be argued that the existence of an active landsdóm would strengthen systems orientated to the creation of public value. The absence of such courts outside Iceland leaves members of their Executives with remarkably little accountability for the public value that they create, fail to create or actively resist creating.

Accountability of members of Executives to their parliaments continues to be criticized due to the dominance of the Executive over the Legislature in many parliamentary systems. In the absence of a court with the remit of a landsdóm, prosecution is rarely possible.

### Normative Factors

Normative factors are unquestionably major influences over the nature and extent of public value created.

As can be seen from the above discussion, none of these factors operates in isolation but rather each forms part of a complex, adaptive system that constitutes the authorizing environment, allocates the productive capabilities and creates public value. Where an element such as a landsdóm is absent, the capacity to create effective public value is diminished; if present, it stimulates observance of the rule of law, respect for the

public trust principle and norms supportive of integrity. If the functioning of say, the rule of law, is effectively absent, the creation of public value is severely compromised, or impossible.

How then are these factors stimulating the creation of existential public value to be advanced? The answer lies in part at least with public administration scholars. We are better placed than most – indeed have a responsibility – to advise and urge those in the authorizing environment to apply the many lessons of public value to ameliorate the emergent existential risks that we all face.

# Entrepreneurial Bureaucracy

Amir Forouharfar
Department of Public Administration, University of Sistan and Baluchestan, Zahedan, Iran

## Synonyms

Bureaucratic entrepreneurship; Economic-developer bureaucracy; Entrepreneurial administration; Entrepreneurial governance; Entrepreneurial public management; High-tech supporter bureaucracy; Industry-developer bureaucracy; Innovative bureaucracy; Public entrepreneurship; Start-up facilitator bureaucracy

## Definition

Entrepreneurial bureaucracy is granting not only the possibility of a bureaucracy to be entrepreneurial in its spirit but also the attainability of a bureaucracy that fundamentally fosters and promotes intrastate entrepreneurship and innovation in both the public and state administration.

## Introduction

Entrepreneurial view to bureaucracy is looking at the bright side of the state machinery, which has led to quantum leaps for humankind. It is breaking the overused cliché that bureaucracy could not be entrepreneurial. The creation of Silicon Valley, state-supported space travels and researches, foundation and administration of stupendous state organizations such as NASA, states' investment on nanotechnologies, new defense technologies and equipment, and government-funded think tanks for innovative policies and analyses of emerging public issues are a few examples which were not possible without putting into practice the entrepreneurial potentials in some bureaucracies. Yet, despite its significance, entrepreneurial bureaucracy remains an undertheorized concept in public administration literature. Hence, the entry broadly presents the general and prevailing characteristics of entrepreneurial bureaucracy as an emerging millennial phenomenon.

In the public mind, bureaucracy has a negative connotation. It is generally believed that it could hardly be innovative and entrepreneurial. The belief partly could be traced back to Marxism that views bureaucracy as a means of exploitation or on Liebich's (1982) words as a "new class" and "ruling class." Once everything is defined with the ideology of class confrontation, bureaucracy as a bourgeois capitalistic class to Marxists and one of the pivotal entities of any state could not be excluded too. Marx proposed his views on bureaucracy based on his study of historical Western states' idiosyncratic moods of "times" that inevitably implies *Hegel's Zeitgeist*. The spirit of the time (Zeitgeist) necessitated such a mentality toward bureaucracy, which shows its preliminary growth in Marx's *Critique of Hegel's "Philosophy of Right."* However, is the *Zeitgeist* still the Marx's one or we could see modern governments with new bureaucratic spirits in the West and the East? Isn't it a time to redefine our views toward the ripen and benevolent fruits of bureaucracy for human civilization? Such views to bureaucracy do not neglect the devastating potential of this state machinery in the hands of totalitarian regimes or the shabby outdated systems of administration in mismanaged states. Hence, it suggests the old metaphor of double-edged sword. Bureaucracy is a neutral administrative system that the state's political spirit defines it how and for what goals to be used, i.e., for the nation's benevolence or malevolence, to lead to utopia or dystopia. Nevertheless, the giant leap of some Eastern states

such as China, Singapore, Japan, Taiwan, and Hong Kong in the mid-twentieth century toward an entrepreneurial economy, besides the top of the list Western states in recent *Global Innovation Index* rankings (2018) such as Switzerland, the Netherlands, Sweden, the UK, the USA, Finland, Denmark, Germany, and Ireland, brings to mind if these states are administered with old definitions of bureaucracy or with a third millennium one, which brought about superseding entrepreneurial spirit in their style of state administration. Although to the readers the phrase "entrepreneurial bureaucracy" mostly evokes a bureaucracy with economic idée fixe (i.e., a dominant and fixed idea in one's mind) for the promotion of entrepreneurism within states, it also refers more broadly but less precisely to descriptions of the political leadership and appointees who work in a team to promote economic development (Cho and Kim 1993). Since entrepreneurship is initially an economic concept, the preceding signals of an entrepreneurial bureaucracy should be logically received from a state's economy and its administration. Economic policies of governments tremendously could affect entrepreneurial aspects of each economy. These policies should be implemented via the bureaucratic machinery of governments. Obviously, each state has its own idiosyncratic economic advantages and disadvantages. Additionally, it would be extremely hard – or sometimes based on the state's capabilities arduous– to change all the economic dimensions for the better. Therefore, what remains is to rely on those economic aspects that each nation based on its historical background, potentials, resources, geographical, and geopolitical advantages, and human resources could change and innovate, i.e., reliance on "the competitive advantage of nations" (Porter 1990). Some economic variables could act as leverage for the economic improvement of different states (e.g., financial system (Levine 1997), fiscal policy and structure (Easterly and Rebelo 1993), fiscal decentralization (Oates 1993), energy use (Stern 1993), social and public factors (Dreze and Sen 1999), agricultural productivity (Matsuyama 1992), exports (Feder 1983), etc.); in other words, in practice a minor change in some administrative economic or noneconomic variables could lead to a major shift to an entrepreneurial administration of a state.

Additionally, the nature of public administration stands for *systems thinking*, i.e., if a state is eager to pursue innovation and entrepreneurship via its bureaucracy, it should have a holistic ecosystemic view, rather than an individual one, to all aspects of public life dynamism. For instance, true innovative outcomes in each economy are culturally bound to the human resources (HRs) who are one of the constituents of that economic system. HRs' "innovative culture" facilitates economic innovation (Knight and Cavusgil 2004: 124). Generally, national culture (e.g., presumably how much human endeavor is needed for the implementation of innovation policies and whether they supersede the cultural tolerances of the nation for work efficiency) also stimulates or stifles innovation and entrepreneurship. If an economic innovation demands studiousness and effective and efficient goal-oriented hard work, obviously it will not be applicable and implementable by a lazy nation accompanied by a fat bureaucracy (in contrast to a *Lean Bureaucracy* as an efficient bureaucracy operating with the least waste and excess). Furthermore, *systems thinking* should provoke the consideration of some other demographic issues within the innovation ecosystem such as a nation's level of education, labor force, health, and population (Gillis et al. 1992) for inspiring national entrepreneurial spirit via bureaucracy. In sum, the entry intends to answer the following question:

## What Is an Entrepreneurial Bureaucracy?

One of the first usages of the phrase "entrepreneurial bureaucracy" is in *Ronald G. Corwin's* 1983 book *The Entrepreneurial Bureaucracy: Biographies of Two Federal Programs in Education*. From the 1980s onward, numerous researches on the connection between bureaucratic contexts and entrepreneurship have been carried out under several topics such as *public entrepreneurship* (Lewis 1980), *bureaucratic entrepreneurship* (Baez and Abolafia 2002), *institutional entrepreneurship* (Zucker 1991), the

relationship between the "techno-bureaucratic elite" and "entrepreneurial state" (Duvall and Freeman 1983), "entrepreneurial governance and public management" (Du Gay 1996), study of "bureaucratic work environments and individual rates of entrepreneurship" (Sørensen 2007: 378), and policy entrepreneurs (Teodoro 2009). The interesting bottom line among all the abovementioned topics is roughly the acceptance of the possibility of partial or overall entrepreneurial orientation within certain bureaucracies. These studies seek a bureaucratic reinvention. Although *David Osborne's* (1993b: 349) echoing "reinventing government" phrase is really reinventing the US, federal, and local bureaucracies and pushing them toward more efficiency and agility and "providing more services with fewer dollars" to relief what he calls "fiscal pain," it could broadly read as the ultimate goal of entrepreneurial bureaucracies as well. Based on a survey study in 1993, Osborne mentions the respondents call for "a complete rebuilding" and "fundamental changes" in the federal government (Ibid.). The public demand for government rebuilding and change did not stagnate in 1993, but it is still a controversial and burning issue which is reflected in the books by Johnson and Walzer (2000), Mani (2002), Fan et al. (2008), Borins (2009), Borins (2014), Altshuler and Behn (2010), Block and Keller (2015), Lewis et al. (2016), Nishihara et al. (2017), and Molnar (2018). Each of these authors the same as a prism disperses and reflects separate dimensions of entrepreneurial governments and their bureaucracies, but they do not discuss a bureaucracy that is holistically entrepreneurial and innovative. Substantially the improbability and oxymoronic condition of a holistically entrepreneurial bureaucracy is due to the acceptance of the myth that all entrepreneurs are reluctant to work for the governments. But Weiss (2014) of Harvard University believes the opposite and names some entrepreneurs as "government entrepreneurs"; he claims that "'government entrepreneur' is not an oxymoron" and provides plenty civic-tech originated by them. However, two decades ago and before the coinage of "government entrepreneurs," they were identified as "entrepreneurial bureaucrats." These types of bureaucrats have the following characteristics: (1) innovative; (2) change oriented; (3) task oriented; (4) optimistic in their perspective toward the future; (5) breaking out of the routines and taking risks by going beyond the routines; (6) motivated for achievements; and (7) seeking higher values (Cho and Kim 1993). *Policy entrepreneurs* and *political entrepreneurs* are two familiar examples of entrepreneurial bureaucrats. The role of *policy entrepreneurs*, who "recognize latent demand for new policies and then expend resources to promote them," (Teodoro 2009: 175) should not be neglected as a pivotal role in shifting bureaucracies toward entrepreneurship. Furthermore, entrepreneurial bureaucracies could not be independent of *political entrepreneurs* who are "distinct description of people who come up with new ways to solve political problems in terms of political philosophy, political technology, political campaigns, and governance" (Carpio 2017). Karlsson et al. (2016) "define a political entrepreneur as a politician, bureaucrat or officer within the publicly funded sector who encourages entrepreneurship for growth and employment using innovative approaches." Moreover, political entrepreneurs are using new small-scale initiatives via AI (Artificial Intelligence), IoT (Internet of Things), and Big Data (large data sets) to disrupt politics arena and influencing the public. However, entrepreneurial bureaucrats, plausibly in respect to their political post, would also influence large-scale arenas such as establishing state's foreign policies or turning state's politics. Political entrepreneurs could play innovative roles in shaping foreign policy. In addition, entrepreneurial bureaucrats contribute the governments to be entrepreneurial, i.e., to be "(1) catalytic; (2) community-owned; (3) competitive; (4) mission-driven; (5) results-oriented; (6) customer-driven; (7) decentralized and (8) market-driven" governments (Osborne 1993a: 1).

On the other hand, entrepreneurial bureaucracies have certain features. Comparing entrepreneurial and traditional bureaucracies Cho and Kim (1993) present the following distinguishing features by careful review of the literature:

(1) traits; (2) motivation; (3) behavior; (4) role; (5) leadership; (6) time; (7) perspective; (8) program; and (9) change attitude (Table 1).

Entrepreneurial bureaucracies could also act in the extra-bureaucratic fields and facilitate state entrepreneurship by the following measures (Kattel and Karo 2016):

1. Public investment into technology, innovation, and science (e.g., *iPhone's* development of 13 technologies with public money)
2. Public procurement of innovations (e.g., government's clear assertion of demands on certain technologies)
3. Economic institutional innovation (e.g., invention of new financial institutions)
4. Political institutional innovation (e.g., participatory budgeting)
5. Public service innovations (e.g., *iLabs*)
6. Public sector organizational innovation

**Entrepreneurial Bureaucracy, Table 1** Distinguishing features between entrepreneurial and traditional bureaucracies

| Distinguishing features | Type of bureaucracy | |
|---|---|---|
| | Entrepreneurial | Traditional |
| Traits | Innovative<br>Beyond routine | Routine<br>Observer |
| Motivation | Task oriented | Status oriented |
| Behavior | Risk-taking<br>Change making | Risk avoiding<br>Change-resisting |
| Role | Assimilating<br>Production-oriented | Dissimilating<br>Consumption-oriented |
| Leadership | Role setting embodying<br>Members' desire in organizational roles<br>Achievement oriented | Law and order oriented |
| Time perspective | Future oriented | Past and present oriented |
| Program | Comprehensive<br>Forecasting<br>Inventive | Ad hoc<br>Contingent<br>Linear |
| Change attitude | Positive<br>Proactive | Negative<br>Reactive |

Source: Cho and Kim (1993: 512)

These bureaucracies accomplish the abovementioned measures by setting the stage for "public-private partnerships." Such partnership had been influential in the personal computer emergence in the USA (Mazzucato 2013). Especially by implementing the first measure, i.e., channeling public investments toward R & D and publically benefiting products.

In case of the USA, social and bureaucratic conditions and necessities played important roles in shifting toward such bureaucracies. Teske and Schneider (1994: 331) introduce some of the major changes in the 1990s that set the stage for the innovation of city administration bureaucracies because of "reductions in intergovernmental aid, citizen demands for new services and low taxes, . . . the value of growth, and the increasing costs of basic service delivery." They believe "some entrepreneurial leaders in government have begun to introduce and implement new policy ideas, improving the efficiency of existing programs and redirect bureaucratic behavior to meet these challenges." A recent example of the shift to entrepreneurial bureaucracies in the USA is the *Internal Revenue Service* (IRS). The reasons for its success according to Power (2013) were "a strong mandate for change (the US IRS Reform and Restructuring Act of 1998); and an outstanding, senior executive from the private sector. . .." The reorganization and technology and process improvement have had major roles in this entrepreneurial shift. More recently, the USA has announced the establishment of *The US Space Force* that is the fruit of an entrepreneurial bureaucracy in the military aspect as "a sixth military service, to be equal with the Army, Navy, Marine Corps, and Air Force" (Cancian 2018). To sum up, these examples and many familiar cases prove the capability of some bureaucracies to be entrepreneurial at least partially and in some specific fields to be able to respond to the emerging millennial necessities.

Bureaucracy is one of the constituents of the prevalent social system, which affects a state. Farazmand (2009a: 5) believes: ". . . A key feature of all bureaucracies – no matter what meaning we apply – . . . is the fact that all bureaucracies are parts of the constitutive elements of the broader

social systems – the society, the government, and the organization of economy and culture or religion." Therefore, if we intend any mega-innovation in a state, at first it should be considered in the overall and systemic dynamism of national missions, visions, strategies, and policies for innovation. All of these innovation seeking entities in entrepreneurial states could not be implemented without an innovative bureaucracy. Bureaucracy is an upstream cause, and public life is a downstream effect (Fig. 1).

Moreover, if we see any trends in a state's economy toward innovation, we should search for the causes in effective and innovation-oriented public policies and reforms, since "administrative reforms, if genuine and implemented seriously, can have significant impacts on the management of economy and society. . ." (Farazmand 2009b: 48). On the other hand, economic condition affects public budgeting (see Campbell and Sachs 1967). Therefore, any innovation in economy, which could be the result of entrepreneurship, should be interpreted as a positive signal toward more efficient public policies in economy. According to Global Competitiveness Report (2008–2009), weak bureaucracies gave birth to weak national economies. The above lines should not be read as the excessive intervention of governments in economy, but they accentuate the significance of large-scale public policies and strategies for the economy. On the other hand, transition from a classical bureaucracy to an entrepreneurial one is a great harbinger of national economic innovations and entrepreneurship. Entrepreneurial bureaucracy pushes forward and stimulates public entrepreneurship that according to Esman (1991: 41) activates "unutilized resources" and inspires "non-routine behavior[s]." Public enterprises which are "any government-owned or government-controlled unit that produces or sells goods to the public" (Kurtz et al. 2001: 980) could also flourish tremendously under entrepreneurial bureaucracies or vice versa. The double-edged quality of bureaucracy can have two contradictory aspects either motivates the entrepreneurs or, in contrary, escapes them. Capital and economic investment are extremely timid creatures, which are so vulnerable to the governmental policies. Moreover, innovation in public enterprises could be partially traced back to innovation-oriented entrepreneurial bureaucracies. Logically, entrepreneurial bureaucratic policies must have more impact on public enterprises than any other active enterprises within a country. The intensity of such an impact could differ based on the degree of economic intervention by the government and the size of public economy (e.g., Rodrik 1998). Additionally, any inconsistency in economic policies would "discourage entrepreneurial behavior" (Kurtz et al. 2001: 749). Such inconsistent economic policies had been usually seen in developing countries (Economist 1985). On the other hand, entrepreneurial bureaucracy could lead to economic prosperity and innovation for a nation. China as a superb example of entrepreneurial bureaucracy in action could be benchmarked and its bureaucratic entrepreneurial policies simultaneously customized and localized by other countries with similar geopolitical and

**Entrepreneurial Bureaucracy, Fig. 1** National policy-making cycle and the place of governmental bureaucracy. (Source: Author's own work)

socioeconomic contexts. The entrepreneurial bureaucracy in the PRC is the result of a large-scale bureaucratic transformation from 1979 with the intention of mobilizing great bulks of financial resources for introducing new public programs and providing public services (Koehn 2009).

Decentralized bureaucracy is a necessity for an entrepreneurial bureaucracy. Entrepreneurship in any form and shape needs flexibility; i.e., rigid and frozen governmental frameworks, which are usually accompanied by over-formalization, are fatal poisons to the nourishment and growth of entrepreneurial seeds within a country. Bureaucracies should act as accelerators or at least as the facilitators of state entrepreneurship not as barriers; i.e., entrepreneurial bureaucracies act as catalysts for public entrepreneurship and public enterprises.

## Generic Characteristics of Entrepreneurial Bureaucracies

Bureaucracy could act as a large-scale incubator for entrepreneurship. Each entrepreneurial bureaucracy potentially consists of three broad concepts (Fig. 2):

1. *Brainware* is the innovative decision-making governmental bodies or top entrepreneurial bureaucrats in the governmental hierarchy that have the authority and power of public strategy and policy settings.
2. *Hardware* is the governmental facilities and equipment, as well as national resources that a government can rely on them in the promotion, regulation, and facilitation of public and private entrepreneurship.
3. *Software* is the commitment to entrepreneurial and innovation-oriented managerial philosophy for public management.

Although there are negative views to the capability of "intra-bureaucratic entrepreneurship" (e.g., Sørensen 2004), bureaucracy as a governmental machinery could go entrepreneurial (e.g., Santana 2017), however in a slow process. Osborne (2007) discussing on "rewriting the genetic code" of public institutions – hence the *Brainware* – believe that public systems and public institutions are metaphorically resemble live organisms that grow or change over time. However, this change evolves very slowly. Osborne also believes "We need to change the

**Entrepreneurial Bureaucracy, Fig. 2** Constituents of entrepreneurial bureaucracy. (Source: Author's own work)

DNA of the bureaucracy and create more entrepreneurial, innovative organizations" (Center for Public Impact 2018). Therefore, a shift to an entrepreneurial bureaucracy – as one of the constituents of the public and simultaneously social system – happens persistently but slowly. The mega-structure of governmental *Leviathan* (Thomas Hobbes' (1588–1679) biblical metaphor for legitimate government; hence, legitimate bureaucracy) cannot be entrepreneurial overnight. First it happens in the organizational DNA, the *Brainware*, which sets the public strategies and policies, in other words, metaphorically in the genetic codes which the line (opposite to "staff"; top) bureaucrats set to be translated by the application of governmental equipment, facilities, logistics, and backup (*Hardware*), in a bureaucracy which has felt the need and has been committed to be innovation-oriented and entrepreneurial not only in economic matters but also holistically in all public affairs and administration (*Software*).

The two bureaucratic phenomena of *policy entrepreneurship* and *political entrepreneurship* inherently could be seen from the same group of intra-bureaucratic entrepreneurs or from different groups of the so-called entrepreneurs. However, logically as innovative policy-makers, they should occupy and be offered influential positions in the decision-, policy-, and strategy-makings of the state, i.e., they act as the *Brainware* of an entrepreneurial state. The governmental body could not be entrepreneurial, unless the line bureaucrats (i.e., "minds") are entrepreneurial. The body orders by the mind. Non-entrepreneurial bureaucracies are fixed and frozen since the *Brainware* or the mind of the monstrous *Leviathan* is rigid, and so they go extinct as dinosaurs' metaphor of Osborne (1993a: 2) for the public institutions in the industrial era with large and centralized bureaucracies, with elaborate and massive hierarchical chains of command and rules. "But in today's world of economic flux, fierce global competition, and sophisticated information and communications technologies, such institutions are dinosaurs. To be effective in these times, institutions (public or private) must be flexible, adaptable, and innovative. They must search constantly for new ways to improve services and heighten productivity."

In essence, based on the generic characteristics of entrepreneurial bureaucracies, they could be one, some, or all of the following bureaucracies:

1. A *Catalytic* bureaucracy that applies private sector potentials and actions as leverage to tackle public problems.
2. A *Community-owned* bureaucracy that empowers communities and families to solve their public problems by themselves.
3. A *Competitive* bureaucracy that does not apply "traditional monopolistic models", i.e., does not use outdated classical methods and models of governance.
4. A *Mission-driven* bureaucracy that in the entrepreneurial sense prioritizes in one hand incentives and regulations that promote national entrepreneurship and on the other hand sets entrepreneurship facilitation and development within the country as one of its bureaucratic missions; accordingly, it will define its budgeting methods and other bureaucratic requisites based on such an entrepreneurship-oriented mission.
5. A *Results-oriented* bureaucracy that pays attention to the outcomes which are achieved through empowered entrepreneurial enterprises, public or private accompanied by more effectiveness and efficiency than mere attention to the administration of routine public needs.
6. A *Customer-driven* bureaucracy that respects the expectations and needs of the majority of nation, i.e., assumes nation as its customer that must fulfill its needs and expectations. Such a bureaucracy also promotes its democratic reputation, public legitimacy, and accountability via selecting this approach. In addition, according to Osborne (1993a: 1) such a bureaucracy puts "resources directly into the hands of the intended recipients of the service (e.g. job training or child care) so that they can make choices based on quality and price."
7. A *Decentralized* bureaucracy that paves the way (e.g., via telecommunication facilities)

for the participation of experts, academia, and intelligentsia all over the country in the state decision-making process.

8. A *Market-driven* bureaucracy, as defined by Osborne (1993a: 1), that restructures "the marketplace when necessary to fulfill public purposes."

In short, an entrepreneurial bureaucracy is an emancipator not a restrictor of public sector's innovative ideas. Moreover, its bureaucratic structure is more agile and flexible than a classical bureaucracy. Therefore, entrepreneurial bureaucracy should decrease its formality and regulations in one hand – for more flexibility – and its hierarchical levels on the other, for more agility (Fig. 3).

## Conclusion

There are negative connotations to bureaucracy in the public mind that is due to the Marxist zeitgeist of the nineteenth and twentieth centuries, the spirit of the twenty-first century, and the third millennium with the advent of competitively innovative governments in the West and the East demands the bureaucracies to be entrepreneurial and innovative. Furthermore, the emergence of issues such as "public entrepreneurship," "bureaucratic entrepreneurship," "entrepreneurial state," "policy entrepreneurs," and "political entrepreneurs" which were broadly described under the entry, although shows entrepreneurship in different aspects of public life, proves the existence and possibility of partial or overall entrepreneurial orientation within some bureaucracies. Bureaucracy as one of the constituents of the prevalent social system inevitably affects public life. Therefore, entrepreneurial bureaucracies could find innovative solutions and service provisions that impact the public life more efficiently. This type of bureaucracies actively seek "governmental reinvention" by the contribution of entrepreneurial bureaucrats who are change oriented, innovative, task oriented, optimistic in their perspective toward the future, breaking out of the confines of routine and taking risks by going beyond the routine, and seeking higher values and are motivated for achievements. The result of their work leads to an entrepreneurial government, which is catalytic, community-owned, competitive, mission-driven, results-oriented, customer-driven, decentralized, and market-driven. Moreover, the distinguishing bureaucratic features of doing public tasks innovatively and out of the routines are being task oriented, risk-taker, and production oriented,

**Entrepreneurial Bureaucracy, Fig. 3** The schematic differences of classical bureaucracy and entrepreneurial bureaucracy. (Source: Author's own work)

especially toward innovative products and facilities which lead to public welfare (i.e., these bureaucracies channel public investments toward R & D and publically benefiting products), as well as having a leadership based on achievement (i.e., result-oriented), being proactive and future-oriented. Eventually, these bureaucracies are having positive attitude toward change when the public calls for it. They also actively support public investment into technology, innovation, science, and public procurement of innovations, and whenever it is necessary, they risk economic institutional innovations or political institutional innovation (e.g., participatory budgeting). These bureaucracies facilitate public service innovations.

Additionally, entrepreneurial governments are tripartite (*Brainware*, *Hardware*, and *Software*). *Brainware* or DNA – which embraces entrepreneurial governmental bodies, policy entrepreneurs, and political entrepreneurs and other line bureaucrats in charge of public strategy or policy setting – plays pivotal roles in the propensity of the government to be entrepreneurial. They constitute the organizational DNA, the *Brainware*, that sets the public strategies and policies to apply governmental equipment, facilities, logistics, and backup (*Hardware*), in a bureaucracy which has felt the need and has been committed to be innovation-oriented and entrepreneurial not only in economic matters but also holistically in all public affairs and administration (*Software*). Transitional process to such a bureaucracy would take place either through bottom-up direction, i.e., when the subsystems that constitute the bureaucracy ecosystem become entrepreneurial, whole the bureaucratic system automatically acts entrepreneurially or by top-down direction, i.e., when the bureaucracy itself shows entrepreneurial propensities, the subsystems will also do the same. Furthermore, an effective state of *Rule of Law* guarantees the complete and correct implementation of entrepreneurial incentives in the public sector, which leads to a superb state in the supervisory, controlling, and law enforcement capabilities to wake up the bureaucratic *Leviathan* as a requisite for the innovative governments of the third millennium.

# Entrepreneurial Bureaucrat, The

Frank L. K. Ohemeng
Department of Public Administration, College of Law, Commerce and Public Affairs, Incheon National University, Incheon, South Korea

## Synonyms

Administrator; Agent; Industrialist; Innovator; Manager

## Definition

Actors who help to propel dynamic policy change in the community. Like other entrepreneurs, they engage in the act of creative discovery by creating or exploiting new opportunities to push forward their ideas.

An individual who undertakes purposeful activity to initiate, maintain, or aggrandize one or more public sector organization.

## Introduction

The new public management and the call for new and innovative ways of delivering public services have given birth to the idea that public administrators should behave as if they are private sector entrepreneurs, even as the debate continues on whether that is possible. Some consider the phrase "bureaucratic entrepreneur" an oxymoron inasmuch as bureaucrats are not trained in the same skills as their private sector counterparts.

Others have forcefully argued for the existence of bureaucratic entrepreneurs in the public sector, although the different contexts mean they do things differently; they face different constraints in their attempt to change institutions. The success or failure of such entrepreneurs depends on the state, and whether it shows an active or a passive interest in what is happening. According to Weiss (2014), the idea of a bureaucratic (government) entrepreneur is perfectly sensible, as was assumed under the new public management. He or she may be seen as a "person who contributes to building a public organization or increasing its ability to deliver services and create value" (Bernier and Hafsi 2007: 489), rather than concentrating on the bottom line.

The bureaucratic entrepreneur aims to improve lives by inventing entirely new ways of serving the public using the scarce resources at his or her disposal. He "identifies market opportunities within the political landscape, optimizes the performance-enhancing potential of innovation for the public sector organization, and carries stakeholders in a way that both permits risk and recognizes the stewardship of public sector resources" (Currie et al. 2008: 987). Currie et al. (2008) further argue that such "entrepreneurs expand the goals, mandates, functions and power of their organizations in ways not foreseen by their political masters. They build coalitions that knit together public and private interests to take advantage of opportunities for entrepreneurship" (989). Moore (1995) says that one of the fundamental assignments of this new entrepreneur is advocacy. He maintains that entrepreneurial advocacy "focuses on what a pubic manager needs to do to maximize the chance that his or her preferred policy will be authoritatively adopted and solidly backed" (151).

## Characteristics of Bureaucratic Entrepreneurs

Bureaucratic entrepreneurs exhibit certain characteristics quite different from those of the private ones. First is change agency. The concept of the change agent has been variously defined. Simply, it means a professional equipped with the skills and knowledge to improve the organizational performance of a system (Ottaway 1983). In the case of the bureaucratic entrepreneur, that system is a public organization, improvement of which has been necessitated by the changing view of how the state should operate. The bureaucratic entrepreneur in this case may thus be seen as the main source for government success in developing and

implementing its program. Bureaucratic entrepreneurs want to make a difference in their community's policies. With their expertise, and given the domains in which they operate, they engage in an act of "creative discovery" (Teske and Schneider 1994: 331) by exploiting new policy and management opportunities that will advance their ideas.

The objective of a change agent is to pursue certain interests and act strategically. They do this by reconfiguring "an organisation's roles, responsibilities, structures, outputs, processes, systems, technology or other resources" (Buchanan and Badham 1999: 610). The agent is interested in institutional structures and who commands resources, information that can be applied to influence institutionalized rules, either by committing those resources to the support of existing institutions or by using them to create new institutions. The agent therefore seeks to work towards changing structures and institutional norms by engaging in forward-looking projective agency, while at the same time providing the legitimacy to support the creation of institutions that will be found appropriate and aligned with their interests for better delivery of public services. From this perspective, the priority of the agent is about altering the structures and the course of institutions through a dynamic process to enhance their performance, by destroying one institution and establishing another.

The bureaucratic entrepreneur change agent is able to mobilize the necessary exogenous and endogenous resources both by acquiring power and by motivating others to join them through what Fligstein (2001) calls social skills. According to Fligstein (2001), "the ability to engage others in a collective action is a social skill that proves pivotal to the construction and reproducing of local social order" (105–106). Without power the bureaucratic entrepreneur cannot effect the desired changes in the institutional setting and cannot shape the character of institutions and institutional change. Their position helps them to develop their strategies. The acquisition of sufficient resources, then, enables bureaucratic entrepreneurs to create new institutions that will promote their particular interests.

Bureaucratic entrepreneurs are also innovative leaders. In an era in which innovation has been a key pursuit in the public sector, such entrepreneurs perceive opportunities for changing policy by advocating new and innovative ideas to meet the needs of both political masters and citizens. They can transform static bureaucratic institutions into more flexible ones. Their ability to innovate leads them to "disrupt the status quo by offering policy solutions to extant but hitherto neglected policy problems or by pursuing new policy initiatives" (Catney and Henneberry 2016: 1326). Teske and Schneider (1993) have unsurprisingly described such entrepreneurs as engaging in the creative destruction of old policies and political paradigms.

It is not, however, easy for them. Teske (2011) pointed out that in trying to exercise innovative leadership entrepreneurial bureaucrats have to work in two worlds: an internal world defined by the demands of managing the local bureaucracy, and a complex external world defined by the political, legal, and economic milieu of cities. Internal issues relate largely to the ability of managers to motivate public sector employees to perform more efficiently and comply with organizational goals. Every government manager faces such problems, but for entrepreneurial managers seeking change, the need to motivate workers to better productivity and to conform to new styles of service delivery is even greater. Their second problem is from the external environment. External issues involve the constraints and opportunities of managers' interaction with local politicians, interest groups, actors in higher levels of government, and the media to the purpose of creating coalitions supporting new policies. The goals and strategies of and constraints on such entrepreneurs differ across these two domains (149). In all, they endure enormous pressure from above and below, as well as around, and must be able to navigate through this labyrinth to get things done.

Bureaucratic entrepreneurs are also socially embedded in the sense that they now have to build and use political, policy, and social networks to achieve their objectives and perform the necessary public functions. Networks have been

described as "structures of interdependence involving multiple organizations or parts thereof, where one unit is not merely the formal subordinate of the others in some larger hierarchical arrangement, and involves the functions of building support, negotiating with others in an agency's external environment, contributing to the management of multi-organizational efforts, exploiting opportunities, protecting the core organization from challenges or threats, and sometimes helping move a set of organizations toward an objective" (O'Toole 2014: 361). Using a network or collaborating with others to achieve policy objectives is a natural consequence of the fact that it has become "harder to govern a pluralist society than to manage a homogeneous one, but that is the challenge that public servants face" (Denhardt 1999: 284). Public problems are now being resolved through other, nonpublic, means, bringing many players into the public policy domain. Bureaucratic entrepreneurs are expected to build coalitions, develop cooperative arrangements, and organize market agreements among themselves, as well as with their political sponsors and with their clients and their representative organizations. Concisely, the bureaucratic entrepreneur has to find alternative, but efficient and effective, ways of engaging these other players to deal with public problems using a variety of skills, not only to find solutions, but sometimes to deal with conflicts that arise within a particular network or networks. They are then able to empower others, be they organizational members or clients or other interested stakeholders, to participate in developing policies and programs and managing results.

Bureaucratic entrepreneurs are economic actors. Catney and Henneberry (2016) are of the view that as such they "engage in forms of institutional bricolage, drawing together resources from diverse sources to produce unexpected results. They may seek to mobilize collaborative action around their policy, which may help to resolve collective action problems" (1327). In spite of this some have argued that resource mobilization, and particularly revenue mobilization, leads such entrepreneurs to exhibit behaviors associated with maximizing the notion of the bureaucrat. Siffin (1981), however, disagrees. To him, revenue gains only indirectly benefit bureaucratic entrepreneurs personally, for under public ownership they do not have independent economic interests. Hence, "bureaucratic entrepreneurs seek to maintain their mandates and protect the budgets of their agencies" (306–307).

## How Bureaucratic Entrepreneurs Get Things Done

Bureaucratic entrepreneurs adopt a number of strategies to get things done in what can be described as a maze of an environment. They first serve as sensemakers and, at the same time, sensegivers, both within and outside the organizations in which they operate. They use the processes of sensemaking and sensegiving to make and give meaning, through cognitive construction and schema, to effect the needed changes. Weick (1995) defines sensemaking as the attempt to make sense of a situation through meaning making or socially constructing an idea for a clear understanding of a phenomenon. Sensegiving, on the other hand, is the process of disseminating new understandings to audiences to influence their "sensemaking-for-self" (Gioia and Chittipeddi 1991: 444). The entrepreneur is thus able to be the person who makes sense of a given situation, especially in the face of continuous environmental changes, resolving any ambiguities the environment may present to or impose on organizational members, and constructing meanings out of them as they pertain to change. In the organizational change process, therefore, these entrepreneurs are the sensemakers to the extent that they identify and pursue opportunities to improve their organizations. Through sensemaking and sensegiving they create and impact meaning, especially the change and the change process, for their intended targets.

Another means bureaucratic entrepreneurs employ is turning themselves into storymakers and storytellers, and using humor to develop and implement change. Storymakers are individuals who use cognitive initiatives to construct plots using the values of the organization that will enhance members' perception of the organization,

while storytellers use their skills to make these members aware of such stories, most often through humor. Stories are "a powerful means of communicating values, ideas, and norms" (Morgan and Dennehy 1997: 495). Bureaucratic entrepreneurs thus use projective stories to help address the challenges of setting future expectations that are comprehensible and plausible both to organizational members and the citizenry.

## Conclusion

Society is rapidly changing. How things are done and the attitude of those with power therefore also have to change. One area where change continues to be advocated is the state bureaucracy. In the early 1990s, it became one of the most criticized institutions of the state. It was described as archaic and having outlived its usefulness. Furthermore, bureaucrats were called out of control and self-serving. Inevitably, some called for abolishing the bureaucracy, but it became apparent that the state cannot function without it. This realization led to the call for a change in the attitude of bureaucrats, for an entrepreneurial bureaucracy in which bureaucrats should behave like private sector entrepreneurs. Since then the idea of the bureaucratic entrepreneur has become one of the hymns of public administration reformers.

Consequently, this entry examined that notion, its characteristics, and how such entrepreneurs get things done. We saw bureaucratic entrepreneurs as not like entrepreneurs in the private sector, but as individual public organization members whose interest is in using public institutions to improve the lives of the people by inventing entirely new ways of serving the public using the scarce resources at their disposal. Such individuals use every means and seize every opportunity to pursue innovative ideas for public sector organizations to be able to better address society's myriad needs.

They adopt and adapt methods. Bureaucratic entrepreneurship has, then, become the modern way of managing and getting things done in the public sector. This entry debunks the notion that there are no bureaucratic entrepreneurs in the public sector and shows that they are able to serve their society better by combining state and private sector ideas.

# Entrepreneurial Competence Among Students

Pragya Singh
Department of Management Studies, IIIT Allahabad, Prayagraj, India

## Introduction

The word "entrepreneur" originated from the French word "entreprendre," which means "to undertake" and generally translated as adventurer or undertaker. And in this twenty-first century, the word entrepreneurship is linked with innovating, risk-taking, adventurism, thrill-seeking, wealth creation, etc. According to Hole (1959), "Entrepreneurship is the focused action of a group or an individual, undertaken to initiate, maintain or exaggerate profit by production or distribution of economic goods & services." Ricado explained Entrepreneurship entails bearing the risk of buying at a certain price and selling at an uncertain price. In academics, this topic accommodates different schools of thought and these scholars tend to focus on what traits, skills, and competencies the entrepreneur has. A competency can be defined as something very good in someone's personality. That is a talent that makes our work run properly. Lathi summarizes competence as a set of knowledge, capabilities, characteristics, and attitudes related to or necessary for good performance. Stoof et al. also concluded that competence can be interpreted as a successful behavior in a work in which knowledge, capabilities, and attitudes work together to accomplish this behavior. Components that form a person's competence consist of wanting, being, capable, and knowledge essential for competent behavior. Each element will be briefly discussed, particularly in relation to entrepreneurship (Driessen and Zwart 1999).

Also, several studies focused on the factors that determine the success of entrepreneurship, especially from the field of psychology and business studies. According to Driessen (2005), ten essential competencies must be owned by an entrepreneur. Those competencies consist of the need for achievement, autonomy, power, social orientation, self-efficacy, endurance, and a risk-taking propensity. Skill components include market awareness, creativity, and flexibility. To be a successful entrepreneur, one needs to know the characteristics and skills of self to perform self-reflection about the potential entrepreneurial competence. Especially if we see the definition of entrepreneurship according to Timmons (in the Driessen and Zwart 1999) that "The ability to make a 'founding team effort' that can contribute in complementing the skills and talents that we have." This information is helpful to assess the strength, characteristics, and capability of skills when deciding to start a business or not. It is also necessary to determine the founding business team, which has complementary characteristics and abilities.

Apart from this, to start any business, one needs to be motivated. Motivation can be generated internally or externally. Thus, in context to this, motivation is divided into external driving factors (pushing factors) and internal driving factors (pulling factors). There are three internal driving factors or motivations to start a business. There is a need for autonomy, the need for achievement, and the need for power. On average, a successful entrepreneur has higher scores for these characteristics than those who own their own business and are unsuccessful. So to start any venture, an individual must have knowledge or education to start the business. Entrepreneurship education (EE) is a term emerging among entrepreneurs, which mainly focuses on to start a business; it consists of the preparation to become small business owners. This study focuses on the practical aspects related to specific phases of starting a company, such as how to obtain financing, legal regulations, taxation, and so on. The dynamics of entrepreneurship education seeks to improve the dynamics of entrepreneurial behaviors after taking the step to start a business. The

goal is to increase the intention of being an entrepreneur and develop dynamic behavior when the company has been operating. So this entry focuses on how education, stimulation, and incubation encourage student entrepreneurship with the help of Information Technology.

## Literature Review

Considerable work has been done to identify these individuals' sociological and psychological characteristics (McClelland 1987). The evidence suggests that there are different types of entrepreneurs that entrepreneurs are not necessarily born or genetically predisposed to entrepreneurship, and that some entrepreneurial potential resides in most individuals. The environment within which the entrepreneur operates includes macro-forces that both facilitate (e.g., well-developed infrastructure, availability of venture capital, and bankruptcy protection) and constrain (e.g., monopolistic conditions, high inflation and interest rates, onerous regulation, and taxation) entrepreneurial behavior in general. It provides what Baumol refers to as the "rules of the game" that determine how the entrepreneurial impulse of individuals is channeled. The environment also provides the specific set of conditions that create the opportunity for a particular entrepreneurial concept.

Over the last two decades, the value of entrepreneurship education has increased for economic growth (Van stel et al. 2005; Braunerhjelm 2010). It was also suggested by Frany that entrepreneurship helps enlighten people and encourage their personal growth. The Entrepreneurial competencies consist of characteristics and skills to become a successful entrepreneur (Driessen 2005). The ten dimensions of entrepreneurial competencies are described follows (by Oosterbeek et al. 2008):

- Need of achievement: A successful entrepreneur has high scores on achievement to pursue appropriate and competitive performance. If necessary, they build their company with professional goals in mind. They set a high target level and strive hard to achieve it.
- Need of autonomy: The need for autonomy is often a subconscious reason for someone to choose entrepreneurship. Successful entrepreneurs with high scores on these competencies reflect independence in decision-making, the ability to overcome their problems, and bringing all the activities to the successful ending with their own efforts.
- Need of power: The need for power is necessary to control another person to influence their behavior. A successful entrepreneur with a high score on this competency indicates that they know what they want and how to influence others to achieve their goals.
- Social orientation: Social orientation reflects an understanding (about successful entrepreneurs) that connection with other people is needed to realize their ideas. They make these connections with ease and are driven by professional considerations in their social activities. They define social needs are set side by side and focus on their business.
- Self-efficacy: Self-efficacy reflects the confidence in the ability of self, such as self-confidence. Successful entrepreneurship is usually ensured that the person can bring any activity towards a successful ending. Also, they feel that they can control their own success, which does not depend on others.
- Endurance: Successful entrepreneurs have a high level of durability. It requires the ability to continue expressly; there are setbacks or rejection conditions.
- Risk-taking propensity: The tendency of taking a risk reflects the ability to deal with uncertainty and willingness to take risks for being losers. This is an essential competence for a successful entrepreneur.
- Market awareness: Market awareness can sympathize with clients' needs (potential) and connect them with its business. Entrepreneurs who recognize the specific needs of particular groups of target customers, anticipate the market changes, and are aware of competitor activity succeed.
- Creativity: Creativity is the ability to adopt a view from a different perspective then see and try new opening possibilities based on the

observation toward environmental changes. Furthermore, creativity reflects the ability to turn problems into new opportunities. Therefore, it is an essential material for successful entrepreneurship.

- Flexibility: Flexibility is based on a measurement of the ability to adapt. Entrepreneurs who successfully react to observed changes in their environment, such as the new needs of clients or new competitors in their market, are flexible.

There are many schools of thought on this topic. Smith and Miner distinguish "craftsmen entrepreneurs" from "opportunists," with the latter being more adaptive and growth-oriented. Miner later empirically identified four types of entrepreneurs, including those who focus on bold moves and are achievement motivated, those who build ventures around salesmanship and networking, those who focus on invention and innovation, and those who are power-motivated and have a desire to lead. Mitchell et al. (2002) define entrepreneurial cognition as the knowledge structures that people use to make assessments, judgments, or decisions involving opportunity evaluation, venture creation, and growth. In other words, entrepreneurial cognition is about understanding how entrepreneurs use simplifying mental models to piece together previously unconnected information that helps them identify and invent new products or services and assemble the necessary resources to start and grow businesses.

DeTienne et al. (2008) built on an escalation of commitment theory and the motivation literature to explain variance in entrepreneurs' decision policies for persisting with a poorly performing firm. Other examples included: attitudes toward the different errors arising from making decisions in environments of high uncertainty, as informed by regret theory (Zeelenberg 1999) and/or norm theory; the level of positive affect, negative affect, and the combination of the two, as informed by the psychology literature on emotion and cognition; the intrinsic motivation to act, as informed by self-determination theory (Deci and Ryan 2000; Ryan and Deci 2000); the level of prior knowledge, as informed by the Austrian economics (Shane 2000), opportunity recognition (Baron and Ensley 2006), or entrepreneurial action (McMullen and Shepherd 2006) literatures (Fig. 1).

## Understanding the Dynamics of Entrepreneurship Through Framework Approaches

A theory of entrepreneurship is a verifiable and logically coherent formulation of relationships, or underlying principles, which either explains entrepreneurship, predicts entrepreneurial activity, or provides normative guidance (Figs. 2 and 3).

**Entrepreneurial Competence Among Students, Fig. 1** Entrepreneurial schools of thought framework

**Entrepreneurial Competence Among Students, Fig. 2** Integrative framework

## Venture Creation Programs: Bridging Entrepreneurship Education and Technology Transfer

Researchers point at potential synergies, such as using university inventions in-class projects, using students as resources in technology evaluation, and increasing awareness of technology transfer opportunities among students (Nelson and Byers 2005).

Interdisciplinarity can connect disciplines, reach across organizational and cultural boundaries within the university, and connect students and faculty from different domains (Table 1).

Engaging entrepreneurially driven students in the venture creation process is a critical contribution that venture creation programs (VCPs) can provide to technology transfer. In return, entrepreneurial education receives access (through the TTOs and incubators) to projects and human capital resources that are "real" and can create an incorporated venture.

Students reach a "tipping point", through contractual and emotional ownership of a real-life venture, treating the venture as "theirs." The literature outlines the potential benefits of ownership perception, such as increased creativity, emotional involvement and commitment, motivation, and responsibility (Cotton 1991).

## The Emergence of the Knowledge Spillover Theory of Entrepreneurship

These thoughts, i.e., the view of entrepreneurship as the channel to commercialize knowledge spillovers outside the source of knowledge creation, complement a long-lasting scholarly tradition having recognized the role of knowledge as the primary source of technological and commercial opportunities and ultimately of economic growth (e.g., among others) where knowledge is created and not fully commercialized for purposes of economic gains, and variables shaping that knowledge spill over to other economic agents – namely, entrepreneurs.

## Serial Entrepreneurs

The dynamic nature of entrepreneurship arises due to a combination of environmental developments and individual characteristics. Serial entrepreneurs are defined in this entry as those entrepreneurs who exit one venture before entering into a subsequent one. Dynamic market conditions may heighten the need to be constantly alert for opportunities for new resource deployment. In these stages, entrepreneurial activity may involve both innovation and restructuring, but

**Entrepreneurial Competence Among Students, Fig. 3** Framework of frameworks approach

there may be lengthy periods of routine coordination in-between. Corporate entrepreneurship involves managers creating new combinations of resources in existing firms. It may be categorized as having three dimensions: the creation of new businesses within existing organizations; renewal and transformation of organizations in some degree of "crisis" through refocusing, major changes in marketing and distribution, reshaping operations, etc.; and Schumpeterian corporate entrepreneurship where the firms' innovations are so significant as to change the rules of competition in the industry (Stopford and Baden-Fuller 1994). In terms of motivations, it is generally thought that entrepreneurs differ from the general population. Still, it is also recognized that there is considerable motivational diversity among entrepreneurs as a group (Woo et al. 1991).

## Self-Regulated Learning, Team Learning, and Project Performance in Entrepreneurship Education: Learning in a Lean Startup Environment

As research recognized the importance of technology-based entrepreneurship as the driver of dynamic capitalism (Kirchhoff 1994) and the force behind dynamic developments, for example, in nanotechnology or pharmaceuticals (Walsh 2014), EE for technology entrepreneurship becomes even more relevant. The challenge is to prepare future

leaders in entrepreneurship, innovation, and technology management with a set of knowledge, skills, and attitudes that enable them to address global challenges (Groen and Walsh 2013).

Lean startup (henceforth: LS) is a collection of tools and techniques employed by entrepreneurs to build their ventures faster and at a lower cost. It is based on the idea that entrepreneurs should make their implicit assumptions about how their venture works and how the market works explicitly. These explicit assumptions can be put to empirical tests in the "real world." More precisely, it is an example of experiential learning that entrepreneurs learn while experimenting in a real-life setting. In new venture teams, LS becomes an example of group-based experiential learning.

Innovation and technology management scholars may know the lean startup approach under the names of "disciplined entrepreneurship", "lean startup", "hypothesis-driven entrepreneurship", and "probe and learn". In essence, these approaches emphasize early customer contact, reflected experimentation, and speed of learning in a technological context. This extends the applicability of lean startup from new ventures to mature companies, such as reducing fuzziness at the front end of innovations.

A phase model of SRL illustrates its elements: First, learners assess their strengths and weaknesses concerning a specific learning task. Second, learners execute strategic planning and goal setting about mainly self-chosen learning goals. Third, learners implement their learning strategy and continuously monitor its effectiveness. Finally, learners compare the actual final learning outcome with the intended learning outcome. Such a model reminds business scholars of a strategic management process (Kaplan and Norton 1996), with its widely discussed performance effects based on, among others, the motivational results of goal setting and relevant feedback.

## Research Methodology

As institutes focus on creating new inventions and knowledge, they serve as an actual output of knowledge and innovation, which can be exploited by new ventures (Shane 2004). Etzkowitz calls it the second academic revolution: the first academic revolution added research as a mandate next to the education of students, now entrepreneurship has become the third mandate of universities. Therefore, academic entrepreneurship has become a priority for policymakers from inside the universities and local governments everywhere. The study focuses on the entrepreneurial education program for MIT, IIIT, and Utrecht University. Participants are PG students, Ph.D. students, and faculty members of the universities. The program is conducted in two phases of 14 days in February and March. The data collection is done with the help of quizzes, the questions on quizzes which are mainly focused on the skills that entrepreneurs need to possess.

The research aims to focus on how education, stimulation, and incubation encourage student entrepreneurship. Therefore, the quizzes included during the program mainly focus on variable entrepreneurship education variable, which has Awareness, Basic Knowledge, Technical Knowledge, Financial Knowledge, and the entrepreneurship skills as independent variables and entrepreneurial intention as a dependent variable.

**Independent variable** – Entrepreneurial knowledge (Awareness, Basic Knowledge, Technical Knowledge, Financial Knowledge, and entrepreneurship skills).

**Dependent variable** – Entrepreneurial intention.

### Hypothesis

**H1: There is a positive association between entrepreneurial knowledge and entrepreneurial intention.**

**H2: There is a positive effect of entrepreneurial knowledge on entrepreneurial intention.**

The quizzes are divided into six parts in which. Part 1 focuses on awareness toward entrepreneurship, which contains 14 questions, Part 2 focuses on basic knowledge about entrepreneurship that includes 10 questions, Part 3 has 15 questions that focus on technical knowledge, Part 4 contains 10 questions focuses on financial ability, Part 5 includes 10 questions focuses on entrepreneurial

**Entrepreneurial Competence Among Students, Fig. 4**

skills, and Part 6 conatins10 questions on entrepreneurial intention.

## Data Analysis

### Demographic Analysis

There are 116 participants from the states of India.

| State | People |
|---|---|
| Telangana | 3 |
| Uttar Pradesh | 18 |
| Tripura | 1 |
| Tamil Nadu | 5 |
| Madhya Pradesh | 3 |
| Jharkhand | 1 |
| Maharashtra | 4 |
| Uttarakhand | 2 |
| Karnataka | 70 |
| Kerala | 1 |
| Himachal Pradesh | 2 |
| Chhattisgarh | 4 |
| Odisha | 1 |
| Rajasthan | 1 |
| Rajasthan | 1 |
| **Gender** | **People** |
| Female | 45 |
| Male | 72 |
| **Occupation** | |
| Research Scholar | 14 |
| Student | 77 |
| Faculty Members/Professors | 26 |
| **Age group** | |
| 26 and below | 65 |
| Between 26 and 36 | 29 |
| 36 and above | 23 |
| **Education** | |
| Ph.D. | 17 |
| MBA | 45 |
| Bachelors/Masters in Technology | 38 |
| Ph.D. and higher | 17 |

### Analysis for the "Awareness About Entrepreneurship"

### Analysis for the "Basic Knowledge about Entrepreneurship"

The first part of the questionnaire contains eight questions on Basic knowledge about Entrepreneurship. For the First question, "Entrepreneurship is an understanding to which 59.1% of the respondents chose an option which is "practice" and 36.4% of the respondents chose "development of a new product," and 0.5% of the respondents chose option "takeover of a competitor" and none of them chose "issuing shares" as an option. For the question, "Active Experimentation on Entrepreneurship is conducted in. . .," 70.5% of the respondents chose "Kakinada District," 13.6% chose "Coimbatore District," 9.1% chose "Biswanath District," and the rest chose "Guntur District." For the question "David C. McClelland's conclusion was the presence of Entrepreneurial. . .," 22.7% of the respondents chose Discipline, 56.8% of respondents chose "Sprit," 9.1% of respondents chose "Team," and 11.4% chose "Value" as an answer. For the question "Edward D. Buno said. . .," 29.5% of respondents chose "Humor is by far the most significant activity of the human brain." Additionally, 29.5% of respondents chose "Don't tell people your plans Show them your results," while 40.9% chose "Entrepreneurs can be made." None of the respondents chose "You can totally do this." For the question "Apart from Entrepreneurial skill what is the most important component that needs focus. . .," 59.1% of the respondents opted "Mindset," 22.7% for Discipline, 13.6% chose "Team/Group," and the rest

**Entrepreneurial Competence Among Students, Fig. 5**

opted for "Money" as an option. For the question "The three model of entrepreneurship development. . ., . . . and . . .," among all the respondents, 52.3% chose "Stimulatory, Support, and Sustenance" 34.1% chose "Social, Institutional and Support" 9.1% opted "Cultural, Ethnic and Institutional," and rest opted for "Social, Support and Showoff." For the next question, "The three pillars of Entrepreneurship Development," 22.7% of the respondents chose "Social, Economic Sustainability and Environmental Sustainability," 50% of respondents chose "Motivation, Capacity, and Ability," 27.3% chose "Discipline, Time, and Patience," and none of the respondents opted "Money, Team and Capacity" option. For the question "The four values of an Entrepreneur. . .," 72.7% chose "Innovation, Independence/ownership, Outstanding performance, Respect for work," while11.4% chose "Willing to modify the invention, Independence/ownership, Outstanding performance." Additionally, 11.4% opted for "tolerance of others, Willing to modify the invention, Independence," and the rest opted for the option "Motivational, Independence/ownership, instructiveness."

## Analysis for the "Financial Knowledge for Entrepreneurship"

This part is to assess the Financial Knowledge for any entrepreneur to start a business. The first question is "Financial decisions are concerned with which of the following?" and the options for the questions are "Making investment decisions that optimize economic value." "Making asset management decisions that optimize economic wealth," "Raising capital that is needed for growth," and "All of the above" among all 100% of the respondents chose "All of the above." For the question ". . . of a firm refers to the composition of its long-term funds and its capital structure," among all, 90% of the respondents opted for "Capitalisation," 0% chose "Over-capitalisation," 0% chose "Under-capitalisation," and 10% choose "Market capitalization." For the question "When . . . is greater than zero, the project should be accepted," 10% of the respondents chose the "Internal rate of return," 10% prefer the "Profitability index," 70% chose "Net present value," and 10% chose "Modified internal rate of return." For the question ". . .is defined as the

length of time required to recover the initial cash outlay," 50% of the respondents opted "Payback-period," 10% chose "Inventory conversion period," 0% opted "Discounted payback-period" but 40% prefer "Budget period." For the question "Corporate wealth maximization is the value maximization for. . .," among all 80% of respondents chose "Equity shareholders," 10% prefer "Stakeholders," 0% chose "Employees," and 10% chose "Debt capital owners." For the question "A capital investment is one that," 70% of the respondents chose "Has the prospect of long-term benefit," 0% chose "Has the prospect of short-term benefit," 10% chose "Is only undertaken by large corporations," and 20% chose "Applies only to investment in fixed assets." For the question "A project whose acceptance does not prevent or require the acceptance of one or more alternative projects is referred to as. . .," 20% of the respondents chose "a mutually exclusive project," 80% chose "an independent project," 0% chose "a dependent project," and 0% chose "a contingent project." For the question "Finance Function comprises," 0% of the respondents opted "Safe custody of funds only," 0% opted "Expenditure of funds only," 40% chose "Procurement of finance only," and 60% chose "Procurement & effective use of funds." For the question "Which of the following is the activity in which finance people are involved?," 70% of respondents chose "Investing decisions," 0% chose "Marketing decisions," 0% chose "Promotion decisions," and 30% chose "None of Above" option. For the question "Financing decision determines," 0% of respondents chose "Current asset," 0% chose "Fixed asset," 20% chose "Equity Mix of finance" option.

## Analysis for the "Entrepreneurship Skill"

The questionnaire contains 35 Entrepreneurial skills questions for assessment among students. For the question "When faced with a problem, I always find a new way of overcoming it," 95.8% of the respondents marked "Yes," and 4.2% marked "No." For the question "When a decision has to be made, I can make it easy even though I am not sure of the outcome," 79.2% of the respondents marked "No" but 20.8% marked "No." For the question "I have a strong need for social interaction," 95.8% of the respondents marked "Yes" and 4.2% marked "No." For the question "After learning how to do something right the first time, I don't change my approach," 62.5% of the respondents marked "Yes," and 37.5% marked "No." For the question "I have a plan of where I want to be financially 10 years from now," 75% of the respondents marked "Yes" and 25% marked "No." For the question "When I am placed in a new situation at work, I quickly sort out what needs to be done," 87.5% of the respondents marked "Yes," and 12.5% marked "No." For the question "I see potential problems as challenges," 95.8% of the respondents marked "Yes," and 4.2% marked "No." For the question "Constantly having to deal with problems wears me down," 66.7% of the respondents marked "Yes," and 33.3% marked "No." For the question "I revise my goals from time to time in the light of changing situations," 83.3% of the respondents marked "Yes," and 16.7% marked "No." For the question "It is important for me to know that I have a Dependable income," 66.7% of the respondents marked "Yes," and 33.3% marked "No." For the question "When I am dealing with a problem, I tend to get stuck easily," 70.8% of the respondents marked "Yes," and 29.2% marked "No." For the question "If I were laid off, I know I could find some other source of income," 95.8% of the respondents marked "Yes," and 4.2% marked "No." For the question "I thrive on the challenge of solving different problems," 87.5% of the respondents marked "Yes," and 12.5% marked "No." For the question "I don't enjoy being directed by others," 58.3% of the respondents marked "Yes," and 41.7% marked "No." For the question "I take courses on how to improve that I do," 91.7% of the respondents marked "Yes" and 8.3% marked "No." For the question "Once I've met a challenge, I am usually satisfied and don't need to look for another project," 50% of the respondents marked "No" and 50% of the marked "No." For the question "I normally start off my day with a list of things to do," 91.7% of the respondents marked "Yes," and 8.3% marked "No." For the question "I don't

enjoy working alone," 37.5% of the respondents marked "Yes," and 62.5% marked "No." For the question "The fear of losing my job causes me great apprehension," 25% of the respondents marked "Yes" and 75% marked "No." For the question "I am not good at dealing with a multitude of problems at the same time," 41.7% of the respondents marked "Yes," and 58.3% marked "No." For the question "I consider myself to be very resourceful in tight situations," 83.3% of the respondents marked "Yes," and 16.7% marked "No." For the question "I usually have a plan of action before starting a project," 95.8% of the respondents marked "Yes," and 4.2% marked "No." For the question "I am good at finding creative ways of solving problems," 91.7% of the respondents marked "Yes," and 8.3% marked "No." For the question "The idea of being my own boss appeals to me," 91.7% of the respondents marked "Yes," and 8.3% marked "No." For the question "At times, I don't feel completely comfortable with myself," 25% of the respondents marked "Yes" and 75% marked "No." For the question "I worry about what will happen if my plans to do the workout," 58.3% of the respondents marked "Yes," and 41.2% marked "No." For the question "When I came up against unexpected obstacles, I prefer not to continue," 25% of the respondents marked "Yes" and 75% marked "No." For the question "I have a strong desire to improve myself in everything I do," 100% of the respondents market "No" but 0% of the market "No." For the question "I read books on how to achieve success," 62.5% of the respondents marked "Yes," and 37.5% marked "No." For the question "I need to keep taking on challenges and feeling myself," 100% of the respondents marked "Yes" and 0% marked "No." For the question "I think of a glass or being half-empty rather than half full," 41.7% of the respondents marked "Yes," and 58.3% marked "No." For the question "I get disappointed when things do not go my way," 54.2% of the respondents marked "Yes," and 45.8% marked "No." For the question "I believe in the saying "If anything can go wrong, it will," 41.7% of the respondents marked "Yes," and 58.3% marked "No." For the question "My friends would call me an optimist," 70.8% of the respondents marked "Yes," and 29.2% marked "No." For the question "I always look at the bright side of life." 95.8% of the respondents marked "Yes," and 4.2% marked "No."

## Results

The results show that the level of education rising with a consistent graph aids the students to be more entrepreneurial in approach. The incubation and ideation of the entrepreneurial journey of the students are highly influenced by the right kind of stimulation and education.

Moreover, the students' familiarity with the ever-expanding Technological advancements creates a sense of resourcefulness in them, thus making them reach the desired results with minimum effort, time, and money investment.

# Entrepreneurial Governance and Civil Service Reforms in Africa

Oluwagbemiga Oluwaseun Ajayi
Department of Sociology, Osun State University, Osogbo, Osun State, Nigeria

## Synonyms

Authority; Bureaucracy; Leadership; Reorganization; Transformation

## Definition

| | |
|---|---|
| Civil Service | Machinery of government which is part of the executive branch of government whose role is to execute government policies, involving bureaucrats and technocrats of the state apart from political or judicial office holders. |
| Reforms | Efforts to bring changes to administrative structure and operational machinery of the civil service, with the view to improving organizational effectiveness and efficiency |
| Governance | The social and political context within which people interact, and by which activities are coordinated |
| Entrepreneurial Governance | Innovative activities by the major stakeholders of a group, which creates new mechanisms for collective action. |

## Introduction

According to Peter Drucker, "institutions, systems, and policies eventually outlive themselves, as do products, processes, and services. They do it when they accomplish their objectives and they do it when they fail to accomplish their objectives" (Drucker 1985). This in effect means that all things that are of human origin eventually become obsolete. This remains true no matter the level of care and attention is devoted to creating and preserving anything. What differs ultimately, when different things are compared, is the pace of the deterioration. And of course, Peter Drucker is not the only one to realize this. However, even though the idea is widely recognized, it is not widely followed. Humans generally do not act as if what they are doing will eventually become outdated. Instead, ideas, products, and inventions are stubbornly adhered to even when they no longer serve their original purpose, or even any useful purpose.

But sometimes, it is recognized that systems and processes need updating or replacing in order

to keep them useful and beneficial. In such cases, the need for change is driven by the desire to keep the organization relevant and effective. It is almost trite, in contemporary times, to say that the world is changing. This then means that organizations that would continue to be relevant and needed must anticipate the direction of change where possible and take appropriate action, or at least identify the change that is taking place and respond to it accordingly. This is the thinking behind civil service reforms. It is against this background that this entry considers governance and civil service reforms. It considers why reforms are needed in the civil service and argues that entrepreneurial governance is best suited to carry out appropriate and long-lasting reforms.

Civil service reforms are about intentionally introducing changes within public services, agencies, and institutions in order to make them more efficient and effective. Change is not introduced for its own sake, nor as a cosmetic or public relations procedure. Instead, the systems, processes, and procedures of the civil service are altered or replaced in order to make the service better as a whole. The idea is introducing change for better performance.

## Definition and Role of the Civil Service

The civil service is the organization made up of government officials tasked with running the public service of a country. These are career officers whose jobs and functions remain constant irrespective of political changes. They provide the services necessary for the effectiveness of government. Omoruyi (1991) describes the civil service as a wide organization that is controlled and funded by the government, it involves bureaucrats and technocrats of the state not of political or judicial office holders employed in civil capacity with their remunerations paid wholly from money voted in the parliament. World Book Encyclopedia (2004) views the civil service as consisting of people employed by the state to run the public institutions of a country. The civil service is therefore part of the executive branch of government whose role is to execute government policies. It is thus the machinery of government.

## Civil Service Reforms

Reforms are needed in the civil service because what has been useful in the past has ceased to be so. Secondly, the drive to make the service perform its responsibility better calls for new ways of organizing and performing within the civil service. Another reason is in response to the society and the government. Governments do develop new policies and these new policies can sometimes call for new actions in order for the goals of the policy to be realized. For example, in 1962 the American president J.F. Kennedy set an ambitious goal of putting a man on the moon within the decade. The vision was grand, ambitious, and compelling. NASA, the US agency in charge of the program, had to be reorganized in order to make it capable of meeting the government's grand objective. Reforms in the civil service are therefore efforts to reconstruct the administrative structure and revamp operational machinery and techniques with a view to improving organizational effectiveness and efficiency (Olaleye 2001).

## Instruments of Reform

There are various methods which have been used to execute reforms across the world. These methods include: employment reducing methods (such as censuses and freezing of employment, forced retirement and lowering of retirement age, early retirement schemes, retrenchments, and assistance to departing staff), reduction of wage bills (restraining growth of real wages per employee, wage freezes, limit automatic increments, consolidating nonwage benefits into salaries, reducing salary differentials with the private sector, matching promotions and pay to performance), improving management (training managers and other senior staff, enhancing staff skills, improving accountability, staff audits, updating of legal framework, and use of modern technology).

## Objectives of Reforms

What makes change necessary within the civil service? Or alternatively, why are reforms needed in the civil service? The overall reason is to make the civil service more efficient in the use of its resources, and more effective in the performance of its duties. To make the service more efficient, the resources of the civil service include money, equipment, and humans. All of these three need to be maximized. Available funds must be judiciously spent, equipment must be used properly and keep functional, while the best people must be attracted and retained within the service. To make the service effective, the objectives of the service must be known and understood by the workers, especially senior staff.

Proponents of the need for reforms in the civil service usually cite the following reasons as justification for such need:

- Making savings (economies) in public expenditure
- Improving service quality
- Making government operations more efficient
- Increasing the likelihood that the chosen policies will be effective
- Give politicians more control over the bureaucracy
- Reducing the hold of bureaucratic restraints on public officials
- Improving government's accountability
- Improving management and accountability
- Downsizing the service to optimum levels
- Restructuring renumeration
- Improvement of service delivery
- Improving interdepartmental cooperation and communication
- Provision of motivation and needed resources to staff for better performance
- Improvement of management and accountability across board

There are no uniform objectives for civil service reforms all over the world. The purpose of any specific reform program depends on the changes needed within that particular civil service. Just as different organizations may have different problems hindering their growth and profitability, so also is this true for the civil service all over the world. Reform programs are tailored to local needs and purposes. In a nutshell, the objectives of reform can be turned around and viewed as the reasons why reforms are needed.

Inherent in these objectives is the idea of making improvements to a deficient organization. This means to look at the past in order to get ready for the future. Perhaps this is being done due to the amount of certainty that such efforts bring. When people respond to the past, they are highly certain of their efforts. There is certainty about what has caused a desire for change and what is to be avoided. This is missing the mark of what true reforms should be about.

What is needed, rather, is more evasive and illusory. Yet it is very real. Reforms are needed to prepare for and create the future rather than correcting or moving away from the past. In other words, responding to the past is not exactly what is needed. The true purpose of reforms is to create and anticipate the future. What is really needed is embedded in the statement by Peter Drucker as quoted in the opening paragraph. The idea being advocated here by him is inherent impermanence. This means that all things that are of human origin have an expiry date attached to them. Anything human will ultimately outlive its usefulness. When this is properly understood, then adequate preparation is made for the future. There ceases to be an undue attachment to the past, rather, there is an anticipation of a future where today's necessities become burdens which we must discard. A proper recognition of this will have important implications for how public organizations are run and how reforms are carried out. On one hand, accepting inherent impermanence will help administrators to let go of what does never worked at all, on the other hand, it will also help them to let go of what has ceased to work.

More importantly, accepting inherent impermanence calls for a different type of civil service administration. Usually, the leadership of the civil service is made up of career bureaucrats at the zenith of their professions. These have learnt, through their long experience in the civil service,

how to play it safe and be totally bureaucratic, while at the same time showing evidence of promoting reforms, restructuring, and modernization. The type of governance needed in the civil service is that which can chart a bold course into the future, communicate same effectively to all parties, while confidently implementing the changes needed. To be sure, this is the kind of leadership found at the top of successful entrepreneurial businesses. So, this can is referred to as entrepreneurial governance. But before a discussion of what entrepreneurial governance is, the next section presents the concept of governance.

## Government and Governance

Government and governance are two closely related concepts that have been used interchangeably. However, they do not mean the same thing. Governance is about how power and authority is exercised, while government refers to the body or group of people exercising that power. Governance is what is being done while government refers to who is doing it.

As suggested by Ysa et al. (2014), governance is an ancient concept. The etymology of the word is found in "kybernan," a Greek word that means to steer a ship. A related concept is found in the word "gubernare," a Latin word meaning to direct. Over the passage of time, the meaning of the word now broadly includes the interaction between the major actors within the state by which policies are formed and implemented. These major actors include trans-national and sub-national authorities as well as private organizations. In effect any group that can influence policy decisions and implementation is included in the governance structure. Two major forces which have influenced this decentralization of power are globalization and the internalization of problems (Ysa et al. 2014). As a result of this, authorities beyond the nation states, such as the UN, have very real roles to play in the organization of the planet. Concurrently, smaller actors, such as private firms, also play important roles within their local contexts.

Governance goes beyond government. "In its widest sense, it refers to the various ways in which social life is coordinated" (Heywood 1997). This point of view makes government one of the institutions in governance. The term also includes civil-society actors who are important players in the society (Mette Kjaer 2004). Therefore, governance is not limited to the existence of government. In fact, governance is possible where there is no government. Governance is thus the social and political context within which people interact and participate in the society. Also, these two concepts can be separated by associating government with "control and domination," and governance with "decentralization and relational management" (Tamayao 2014). In this sense, government is a centralized political authority exercising power over citizens, while governance is about decentralization of power. Government holds on to power and uses it for the purposes it deems fit, while governance spreads authority among various state actors and recognizes a broader participation in civic life.

Consequently, the following distinctions can be made: "governance as a structure referring to the formal and informal set of institutions involved; governance as a process referring to the dynamics and leading functions that take place in the process of policy making; governance as a mechanism referring to the institutional procedures of decision-making, as well as compliance and control; and governance as a strategy referring to the manipulation of the institutional and mechanical design with the aim of influencing choices and preferences" (Levi-Faur 2011; Ysa et al. 2014).

It is thus difficult to find one predominant definition of governance or even an agreement on what the definition should include. Therefore, the term is used according to the context within which the word is employed. Grande (2012) identified five key elements in governance concepts: "(1) new nonhierarchical structure and mechanisms; (2) governing and the criticism of hierarchy as steering principle; (3) emergence of new actors, either private or nonprofit; (4) increasing complexity of political actions, and (5) increasing cooperation and collaboration among stakeholders."

Following are some definitions of government:

> the process of governing through which decisions are made that are intended to affect societal outcomes, including economic, social, environmental and other important outcomes. (Wolman et al. 2011.

> the formulation and execution of collective action at the local level. Thus, it encompasses the direct and indirect roles of formal institutions of local government and government hierarchies, as well as the roles of informal norms, networks, community organizations, and neighborhood associations in pursuing collective action. (Broadway and Shah 2009)

"The office, authority or function of governing. Governing: having control or rule over oneself." (Fasenfest 2010).

On the other hand, governance has been defined as:

> structures and processes that are designed to ensure accountability, transparency, responsiveness, rule of law, stability, equity and inclusiveness, empowerment, and broad-based participation. Governance also represents the norms, values and rules of the game through which public affairs are managed in a manner that is transparent, participatory, inclusive and responsive. (Hewitt de Alcántara 1998)

> power relationships, formal and informal processes of 'formulating policies and allocating resources,' 'processes of decision-making' and 'mechanisms for holding governments accountable.' (2009 Global Monitoring Report)

> A set of decisions and processes made to reflect social expectations through the management or leadership of the government. (Fasenfest 2010)

> Governance determines who has power, who makes decisions, how other players make their voice heard and how account is rendered. Governance is how society or groups within it, organize to make decisions. (Institute on Governance 2006)

> refers to how any organization, including a nation, is run. It includes all the processes, systems, and controls that are used to safeguard and grow assets. (UNDP 1997a)

> Involves the interactions among structures, processes and traditions that determine how power is exercised, how decisions are taken, and how citizens or other stakeholders have their say. (Plumptre and Graham 1999)

There is need for governance anytime a group of people come together to achieve a particular objective. Once there is a goal to be achieved, and the process of goal achievement calls for collaborative efforts among some people, then there is need for a governance structure which will oversee the activities of the group.

## Entrepreneurial Governance

In effect, governance is about leadership. Just as leadership can be dynamic or conservative, so also can governance be dynamic or conservative. Dynamic leadership actively creates what is needed. It sets the pace. Conservative leadership is reactionary. It manages to respond to changes forced upon the organization. Just as leadership sets the pace, tone, and direction for the group, so also is the nature of the governance structure reflected in the entire system.

In addition, if reforms are needed in order to make the civil service more effective in its service delivery, then the leadership must be able to identify the right services to deliver and how best to deliver them. In short, the leadership of the civil service must be focused on the public, on how best to serve the public interests in the most cost-effective and frictionless manner. This calls for a different type of governance at the top of the civil service system. Specifically, this calls for entrepreneurial governance.

To be sure, entrepreneurship is not a word that is commonly used along with governance. Entrepreneurship is generally perceived as the act of starting new firms. The popular perception of entrepreneurs is those who spot new economic opportunities and go ahead to innovatively exploit these opportunities. This narrow view of entrepreneurship is now changing. Entrepreneurship is now being recognized as the act of recognizing or creating new opportunities and exploiting those opportunities. This is what Westlund (2011) refers to as multidimensional entrepreneurship. This new way of describing entrepreneurship sees it not just as activity oriented towards making financial gain, but as a way of making things better in any aspect of society.

The concept of entrepreneurial governance thus lies at the crossroads of two older disciplines:

entrepreneurship/business administration and political science. Shane and Venkataraman (2000) describe three stages of the entrepreneurial process: (1) identifying and evaluating opportunities, (2) collecting and mobilizing resources, and (3) exploiting the opportunities (for private or collective utility). This establishes the part of the concept rooted in the discipline of entrepreneurship. The political science part is seen in Schneider and Teske (1992), which sees political entrepreneurship as "a speculative act of creative recombination that, when successful, transforms the institutional boundaries of authority"; as well as Olsson, Westlund, and Larsson (2020), which sees entrepreneurial governance as "activities aimed at being productive or developmental. . .that create new institutions for collective action or learning within a municipal governance framework."

Accordingly, initiatives by the existing governance structure to make innovative changes and develop better ways of meeting the group objectives is seen as entrepreneurial governance. Within the civil service, Entrepreneurial governance sees the civil service not as state centered, but as society centered; not as government centered, but as governance centered. It brings and keeps the focus of the activities of the civil service on the society. It therefore serves the interests of the society in the best way possible. This clearly is still an ideal in all countries, to a greater or lesser degree. What is seen in most is that the civil service works to mindlessly implement rules and procedures and follow the directives of the government of the day. The civil service does not make its own rules, the rules are often made by the government. The civil service is meant to assist government with governance. Reforms, however, give the civil service opportunity to orient itself towards service delivery for the public. To make it clearer, entrepreneurial governance within the civil service knows whom it serves, and continuously looks for better ways to deliver this service.

## Conclusion: Entrepreneurial Governance and Civil Service Effectiveness

Theories of entrepreneurship have been developed to show how innovative persons create and take advantage of economic opportunities. This is still the dominant view of entrepreneurship. But as shown above, the concept of entrepreneurship has spread to other aspects of society. It is possible and quite normal to wonder whether this is justifiable. Olsonn et al. () think it is. They note a fundamental difference between firms and politically governed bodies. Firms actively compete in search of profits; politically governed bodies act to redistribute some of these profits. This means that while firms are concerned with beating competitors in order to make more and more profits, other bodies, such as the civil service, are concerned with proper redistribution of some of these profits for the public good. Consequently, Olsonn et al. () argue that "even if the ultimate aims of entrepreneurship differ between the private and public sector (profit vs. public services) . . . entrepreneurial behavior can be classified within the same conceptual framework, i.e., to identify and evaluate opportunities, to collect and mobilize resources, and to exploit opportunities."

Since the purpose of the civil service is to aid government in the execution of its policies, then this calls for a service that is focused on government objectives and the public it is meant to serve. And as it has been argued earlier, this will require entrepreneurial governance for the civil service. The relationship between entrepreneurial governance and civil service effectiveness may and may not be directly linked. It might be difficult in many cases to prove a simple cause and effect relationship. A more iterative relationship between the two could be discovered. For example, as governance improves, this would make the civil service more effective. Also, a more effective civil service would demand for – even provoke – a better governance structure. And as is common in all things social, there would also be nonlinear relationships which could include intervening variables such as the government of the day. Whatever the case may be, that the form of governance would impact effectiveness is an irrefutable fact.

The same applies to the relationship between governance and reforms within the civil service. Reforms are about change. As the cliché goes, people are resistant to change. As reforms are intended to make the civil service better, governance would include identifying innovative ways

to introduce the changes needed. Sometimes such innovation may not be direct. On the other hand, the impact of reform initiatives may require quite some time coupled with continuous implementation in order to be seen. At the very least it can be expected that entrepreneurial governance will be strong and innovative enough to introduce and implement needed reforms in the civil service. The end of this will be the creation of a strong future for both the civil service and the society that it serves.

# Entrepreneurial Governance in Succession

Md. Shariful Islam
Institute of Business Administration, University of Rajshahi, Rajshahi, Bangladesh

## Synonyms

Entrepreneur: Founder, Incumbent, Leader, Owner-manager, Present owner; Family-owned firms: Family business, Firms under family ownership

## Introduction

In every business succession is a common phenomenon and it is considered as the most critical

issue in those firms (Ibrahim et al. 2001). Therefore, a proper succession process is important in the sense that it affords the firms to select the most appropriate leaders to carry on the business successfully over years.

While succession planning is considered as exit strategy for entrepreneurs, it has been observed from studies that it helps in successful succession (Ibrahim et al. 2001; Lambrecht 2005). Despite of importance, many firms lack succession plan, which might be caused by resistance of the entrepreneurs or incumbents. Lansberg (1999) shows that these incumbents are reluctant to empower their successors in the businesses in fear of losing control. This nature of the incumbents adversely affects entrepreneurial governance in the business and that may lead to failure of the firms in many instances.

Therefore, it is important to understand factors that are responsible for resistances of the incumbents in making a sound succession plan that is needed for successful succession in the business. This paper reviews literatures to summarize incumbent-related factors that affect succession planning. The following section furnishes modes of succession, phases involved in succession, succession models, incumbents' resistances in succession, succession plan and its importance, and incumbents' internal and external factors that affect succession planning in businesses.

## Modes of Succession

Steier (2001) distinguishes among unplanned and/or sudden, rushed, natural immersion, and planned succession. In case of unplanned and/or sudden succession, the successor suddenly takes over operational responsibilities of the business because of departure of the incumbent caused by death and/or other unanticipated events. Proper transfer of information and experience to next generation cannot occur in such situations. In contrast, in a situation of rushed succession, critical information can be communicated to the younger generation. Thirdly, in natural immersion, successors are steadily integrated in the firm, and as a consequence, successors can adjust to structures and relationships of network of the firm. In planned succession, which has been defined by Steier (2001) as the most ideal mode for passing on social capital, current generation prepares for handing over the property to next generation.

## Phases Involved in Succession

In relation to the individual factors related to incumbent, the generalized succession process is usually categorized into three phases such as (i) pre-business involvement phase for successor, (ii) development phase for the successor, and (iii) transfer of power and authority phase.

(i) **Pre-business Involvement Phase for Successor**

During this phase, the incumbents are with all the decision-making powers. This is the phase when potential successors in an educated society are completing their basic education. At this stage, subconscious leadership development of potential successors starts. They observe the incumbents in the business and learn to act and behave as a leader for the future business. It is noteworthy that incumbents' role as leader continues throughout the succession process. However, nature of this leadership changes in different phases of succession.

(ii) **Development Phase for the Successor**

During this phase, the successor usually has completed higher education and is provided with a responsible role and position in the firm. Here the role of incumbents changes. The incumbents have to delegate authority so that the decision-making capabilities of the successors can be developed. Successors are trained through different departments, and they learn how to conduct the business and get to know the culture of their own organization. During this phase, they are encouraged to develop experience by working on different managerial positions either within the organization or outside the organization.

(iii) **Transfer of Power and Authority Phase**

This is usually the last phase of succession process. During this phase, the decision-making power is delegated to the successors to a larger extent. This is the most crucial phase of business succession, because at this stage, the incumbents have to decide about their future role in the organization. Sometimes, they have to decide to let go the organization once they created or owned. If they are able to find new opportunities for themselves through new venture creation or simply by retirement, the succession process will see success. If not, they can reflect and find a role for themselves in the organization by acting for the organization in different ways. They can become member of board of directors or they can act as an advisor for the firm.

## Succession Models

Different succession models have been developed over a period of time (Lambrecht 2005). The following section analyzes three popular succession models: (i) life cycle model, (ii) mutual role adjustment model, and (iii) six stepping-stones to the transfer of family business.

(i) **Life Cycle Model**

Churchill and Hatten (1997) have developed a life cycle approach to describe the succession process between father and son. They distinguish four stages: (1) a stage of owner management, (2) a stage of training and development, (3) a partnership stage between father and son, and (4) a stage of power transfer.

The owner management is the stage where the business is controlled single-handedly by the owner or incumbent while the successor is not directly involved in the business. Second stage, training and development, is the stage where the offspring gets opportunity to learn the business by visiting the business and taking part in the business. But the successor does not get any significant responsibility yet from the incumbent. In the third stage, partnership develops among the incumbent and successor. In the last stage, actual power transfer takes place where responsibilities shift to the successor.

(ii) **Mutual Role Adjustment Model**

The mutual role adjustment model was presented by Handler (1989). The fundamental conjecture of this model is that the incumbent and successor both should have the ability to adjust to the changing nature of their role in the business. The longer the time they will take to adjust to the newer role, the delayed would be the succession process. Failure to adjust role may lead the incumbent to move the succession to the level where he/she does not leave the business until forced out or dies and the successor will only be able to work as a helper. In this case, the individual factor of health conditions of the founder will decide for the next move of the successor. If the founder is not in good health, then the successor will be able to take over position of the founder cum present owner of the business.

(iii) **Six Stepping-Stones to the Transfer of Family Business**

This model was developed by Lambrecht (2005) on the basis of empirical research where firms under family ownership were taken into consideration. The first stepping-stone is "entrepreneurship." During this step, the transfer of professional knowledge, management values, leadership characteristics, and the soul of the family business are passed to the following generations. Lambrecht (2005) distinguished three life stages of the child that influence transfer of professional knowledge. In the first stage, the business is like a playground for the child. In the second stage, possible successors perform light activities in the business, and in the third stage, he/she performs work that was more serious in the business. In this way, potential successors at a young age learn the secrets of products and tricks of trades.

Second stepping-stone for the successful transfer of business is "studies." It is argued by Lambrecht (2005) that before taking a full-time entry in the business most of the successors are encouraged to earn an advanced academic degree. In a number of cases, successors and the families prefer studies that may help them in the business. In other cases, potential successors are free to choose a discipline that may or may not fit in the business directly or indirectly.

Larger family-owned firms sometimes provide "formal internal education" for family members at a young age. This has been mentioned as the third stepping-stone for succession. During this stage, successors learn about the major contacts and dealings and also get proper understanding about the business. Incumbents also judge the capabilities of the potential successors during this stage.

The fourth stepping-stone is the acquisition of "external experience" or outside work experience that a successor gets from working in other companies. This provides the potential successors with knowledge and worldly wisdom. This helps them in achieving self-confidence that ultimately helps them in successfully running the business in later part of their life.

The fifth stepping-stone is the "official start of the successor in the business." Before the successor gets a management position, he/she generally passes through various departments in the business. This helps successors to gain necessary confidence of employees and other stakeholders. This also helps successors to discover the business, the sector, and customers.

The sixth stepping-stone relates to the "written planning and agreements." This helps achieving successful succession in the family-owned firms. However, written plans are not an absolute guarantee for a successful transfer because it may be accompanied by poor planning and wrong selection of successors that could prove costly for the business and the family.

## Incumbents' Resistances in Succession

A few studies link the failure of the succession with the role of the incumbents in the same. It has been mentioned earlier that many of the incumbents are reluctant to empower their successors in the businesses in fear of losing control (Lansberg 1999). In a study, Sonnenfeld (1991) presents various types of retirement styles of founders where two of those lead to failed succession and the other two help in successful succession. Furthermore, many founders select inadequate successors who inevitably result into failure. Levinson (1974) in a study uses the terms loyal servant, watchful waiter, and false prophet to describe three types of inadequate successors chosen by an incumbent. The first type is a reliable helper but lacks the leadership abilities. As a result, he/she remains as a loyal servant and always seeks help of a leader. The second is a star performer from outside the firm. But he/she has to wait for a longer period of time and sometimes indefinitely, for the top position and power in the firm. The false prophet, the third type of inadequate successor, is a person whose area of competence is not related to the role required and therefore is an unrealistic choice as a successor for the firm. Therefore, it is evident that incumbents often do not want a successful succession in the firm.

## Succession Plan and Its Importance

Succession is arguably the most important and critical issue in businesses. A proper succession planning process provides the firms with opportunity to select effective leaders who are able to take the business to a new level. A study shows that when the business is a family business, tension and conflict typically plague those family-owned firms due to the absence of proper succession planning (Ibrahim et al. 2001). Barry and Jacobs (2006) define succession planning as a process through which companies plan for the future transfer of ownership. Firms and succession have a close relationship, and planning can be the magic formula for successful succession.

## Incumbents' Internal Factors Affecting Succession Planning

There is an agreement found among most researchers that succession is more of a process

than an event (Churchill and Hatten 1997). Succession is not simply a single step in time and space which takes place at once; it is a multi-stage process that exists over a longer time, beginning before heirs even enter the business. Furthermore, the effectiveness of succession is not limited to whether a successor has been chosen, but the entire process of succession also depends on the individual nature of the incumbent and successor as well. The role of incumbent is of utmost importance during succession process. The incumbent is the one who is the center of power and authority in the organization during succession. Therefore, succession planning is one of the key activities in any business where governance has to be ensured for a successful succession in the business. The following section of the chapter discusses incumbent-related factors that have been studied by previous researchers that affect succession planning behavior of the incumbents.

### Founders' Link to Reality

Factor which may hinder successful succession in business is that the business may become the founders' link to reality and the way of dealing with conflicts that he learnt during his childhood. Levinson (1971) identifies three important ways the firm gives the founders of meaning about reality. First, in some cases, successors have some unresolved issues with their predecessors that motivate the successors to start their own business to escape from the authority of the predecessors. Second, because the new business is their brain child and it represents "baby" to the founders, they consider people including successors working in the business as nothing more than tools for shaping the company as per their dream. Third, the business represents an extension of them. In these ways, founders mix up succession with their own personal concern about their position after succession. As a result, if the incumbent is involved in the business and there is no new opportunity for him outside the business, the incumbent may hinder entrance of the successor in the business.

On the other hand, according to Handler (1989), if the leaders are able to find new opportunities to reflect themselves, then the succession process would be successful, otherwise the incumbent will be able to move the succession to the level of "monarch" from the stage of sole operator, and the successor will be only able to work as a helper. The term "monarch" has been discussed in later part of this chapter. Similarly, Churchill and Hatten (1997) argue that the ability to look for new opportunities for incumbent's own life is really helpful for smooth process of succession.

**Factors Identified**

(i) Incumbent's capacity of self-reflection
(ii) Incumbent's opportunity of new life

### Homosocial Reproduction

A type of failed succession occurs as a result of "homosocial reproduction" where the incumbent often tries to reproduce the organization's future leader in his or her own image (Kanter 1977). The incumbent wants that the successor will follow the incumbent's original fashion in the operation of the business. Different approaches have been discussed in literature for the incumbent to overcome such a problem and help leading to successful succession such as "helping" the entrepreneur to become more self-aware and/or "encouraging" the entrepreneur in shifting himself from the current business by starting a new venture (Zaleznik and Kets de Vries 1985). This can be explained as ability of the incumbent to disassociate him/her from the existing business.

Similar arguments have been presented by Sonnenfeld (1991) who shows that leaders who plan to stay in the business forever, lead the business to problematic succession. He argues that things become more complex at later stages as time and retirement pressures are felt in the firm. Often this results into loss of their status and power. In other words, incumbents find it difficult for them to disassociate from their original business that lead to failure in achieving successful succession in the business. Similarly, Handler (1989) shows that if the leaders are able to disassociate themselves from the business, then the succession process would be successful.

**Factor Identified**

(i) Incumbent's ability to disassociate from the business

### Delegation of Power and Authority

A few studies relate failure of the succession with desire of the incumbents for authority. Sonnenfeld (1991) presents four types of retirement styles of founders. According to this researcher, "Monarchs" do not leave until they are forced out or die. "Generals" leave office only when forced out, but they plan a return to power often to rescue the company from an inadequate successor. "Ambassadors" plan a succession, and they leave the firm willingly and act as advisors to the firm. "Governors" rule for a term and then they move on to pursue other ventures. "Monarchs" and "Generals" are responsible for problematic succession, while "Ambassadors" and "Governors" help in successful succession, where they let the firm to go to successors. Therefore, for a successful succession, timely delegation of power and authority is essential. Lambrecht (2005) shows that incumbents' ability of letting go the role that is played by them in the business to the successors significantly increases the chance of a successful transfer. But it has been mentioned earlier that many incumbents are reluctant to empower their successors in fear of losing control over the business that ultimately makes the succession planning difficult (Lansberg 1999).

**Factor Identified**

(i) Incumbents' ability to delegate power and authority

### Leadership Ability

Incumbent's behavior as a leader in the succession process is a complex issue as it is not only multifaceted but also dependent on the overall system in which leaders operate. A good way to study the underlying dynamics of leader behavior is by focusing on leader personality.

The effectiveness of leadership in a business is crucial, especially during the succession process. In relation to the individual factors related to the incumbents, if they have got better leadership qualities, they will be able to make the succession process successful (Handler 1989). The incumbent must judge the successor on the basis of appropriate values, skills, and motivations. Incumbents with strong leadership ability help the successors in developing the effectiveness of the later for the business. In this case, the role of the incumbent is more of a mentor. To increase effectiveness of the succession process, an incumbent with strong leadership ability ensures open communication between him and the successor about the current operations and future state of the business (Lansberg 1999). The incumbent plays a vital role in introducing the successor to the environment. Cadieux (2007) shows that incumbents' involvement in this respect is quite remarkable. According to this study, incumbents create grounds with employees so that the joining of the successors becomes easy. During transfer of specific responsibilities to successors, the incumbents systematically direct employees to the successor for all issues relating to that responsibility. That helps others to understand that the incumbents are gradually handing over the reins to their successors. As far as the external environment is concerned, it is also found that incumbents gradually introduce their successors to customers, suppliers, and other players with whom they maintain special contacts as part of a process that varies in terms of its formality. Furthermore, succession can be more effective when the two generations have respect for and understanding with each other. High trust and mutual support characterize a high-quality work relationship between owner-manager and successor.

**Factor Identified**

(i) Incumbents' leadership ability

## External Factors Affecting Succession Planning

A number of studies reveal that the incumbents are influenced by external factors that guide them toward a particular type of behavior in the succession process. Cadieux (2007) shows that incumbents create grounds with employees so that the joining of the successors becomes easy. As far as

the external environment is concerned, it is also found that incumbents gradually introduce their successors to customers, suppliers, and other players with whom they maintained special contacts as part of a process that varies in terms of its formality. This shows that the incumbents are concerned about the acceptance of the successors to external stakeholders.

In other studies, researchers have identified a number of external factors that influence behavior of the incumbents during succession. Lambrecht (2005) shows that wife has influence on respective incumbents and that affects success or failure of succession. Massis et al. (2008) show that, along with other factors, incumbents' unforeseen remarriage, divorce, or birth of new children and relationships of the incumbents with family and nonfamily members involved in the business affect succession of the business. According to this study, major relational factors include conflicts/rivalries/competition in parent-child relationship, conflicts/rivalries/competition among family members (e.g., sibling rivalries), perils related to high "consensus sensitiveness" of the business, lack of trust in the potential successors, lack of commitment to the potential successors, conflicts between incumbent and/or potential successors, lack of acceptance of the potential successors, lack of trust in the potential successors, and lack of commitment to the potential successors. Sharma and Rao (2000) show that Indian owners compared to Canadian firm owners rate family relationships higher. In other words, Indian incumbents are concerned more about the likes and dislikes of the family members. Researchers propose four related variables such as respect of actively involved family members, respect of non-involved family members, trust of family members, and ability to get along with family members which are highly important factors that influence the incumbents in succession planning.

**Factors Identified**

(i) Concern for acceptance of the successors
(ii) Incumbent's wife, remarriage, divorce, birth to new child, etc.
(iii) Relationship of the incumbent with family or nonfamily members
(iv) Conflicts, rivalries, competition, etc.
(v) Like or dislike of the family members.

## Conclusion

This chapter has presented a number of internal and external factors that affect incumbents of firms in succession planning. As this chapter is based on literature review, it does not test the factors in any particular market place. One of the major causes of business failure is human behavior. But as human behavior may be influenced by cultural and socioeconomic variables, research works are suggested to test validity of both internal and external factors in different market places. That may help in achieving a clear understanding about incumbent related factors affecting succession planning behavior of the same in specific market places which may ultimately be helpful in establishing good entrepreneurial governance.

# Entrepreneurial Mind, The

Francesca Flood
Hope Verdad, LLC, Lake Frederick, VA, USA

## Definitions

**Bootstrap**: Get (oneself or something) into or out of a situation using existing resources.

**Offshoot industries**: Markets, products, and services that have developed from the study and promotion of entrepreneurship.

**Entrepreneurial spirit**: A mindset that embraces curiosity through continuous and critical questioning and seeks innovation by product, service, or operational improvement with a willingness to accept risks.

**Personality constellation**: A set of ideas, conditions, symptoms, or traits that fall into or appear to fall into a pattern affecting personality and behavior.

**Locus of control**: A psychological concept that refers to how strongly people believe they have or lack control over the situations and experiences that affect their lives.

**Emotional Intelligence**: The ability to understand, use, and manage one's own emotions in positive ways to relieve stress, communicate effectively, empathize with others, overcome challenges, and defuse conflict.

**Neuroticism**: Propensity toward anxiety, depression, self-doubt, and other negative feelings. One of the Big-5 macrotraits on personality testing.

## Introduction

The subject of entrepreneurs and entrepreneurship has created much examination, debate, and many unresolved questions. Are entrepreneurs born with a certain "gene," that fosters this spirit, or are entrepreneurs made from an amalgamation of life experiences? Does being self-employed or a business owner mean the person is an entrepreneur? The topic of the entrepreneurial mind also raises many questions. What personality traits do entrepreneurs possess? Are these personality traits required to become an entrepreneur? Can a person be successful without them? Are entrepreneurs risk takers, happy, anxious, resilient, and so forth? Indeed, research on entrepreneurial personality traits is replete in the literature and emphasized as a contributing factor. Yet beyond personality traits, the entrepreneurial mind requires further examination. Gender, relationship with family, leadership skills, circumstance, and other contextual factors play a role and can influence the entrepreneurial mind. While this entry will discuss some of the personality traits associated with entrepreneurs, it will also expose and explore other influencing facets. What defines an entrepreneur is not a tidy subject with one, definitive, and universally agreed upon understanding. Misconceptions on the subject persist and entrepreneurship have darker challenges that are not as vastly explored as personality traits. In this entry, the reader will be exposed to an array of variables that influence and shape entrepreneurs and their experiences with an aim to provoke thought for current entrepreneurs and those who dream of becoming one.

## Background

Which comes first, the chicken or the egg? This age-old question is a causality dilemma that suggests it is impossible to decide which of two things caused the other one. A similar question holds true for entrepreneurs. Are they born or are they made? It is a subject that industry specialist, psychologists, academicians, thought leaders, capitalists, and a whole host of others debate. The answer to this question will depend on who you are asking, and there will be no clear-cut answer. Depending on one's theory, some believe nature, some nurture, and others believe it may be both that contribute to an entrepreneur's creation. Yet whether a person is born an entrepreneur or becomes one through life experiences, there is a general consensus that they possess certain personality constellations or traits that enable and foster an entrepreneurial spirit.

Personality traits are the single most unique thing about an individual. According to Allport (1937), traits are organized into a three-level hierarchy. Cardinal traits are rare because few people have personalities dominated by one trait. These traits are pervasive characteristics that strongly determine one's behavior and become the individual's identity (e.g., Scrooge was greedy. Hitler was ruthless. Mother Teresa was compassionate). Central traits influence but do not determine an individual's behavior. They are general characteristics that form basic personality foundations present in varying degrees in all individuals such as "moody," "warm," or "intelligent." Secondary traits are strongly dependent upon immediate context and can influence but do not determine an individual's behavior (a person who is usually confident gets stage fright). Regarded as dynamic forces, traits combine and interact with each other and the environment forming a personality that is unique to each person (Allport 1937).

## Personality Traits in Entrepreneurs

Personality tests are in abundance. When we test personalities, we are attempting the best way to inventory, summarize, and understand an individual. Though there seems to be countless personality variables, five traits appear to distinguish themselves in terms of explaining someone's answers to personality questions. These five traits, or the "Big-5," are macrotraits including openness, conscientiousness, extraversion, agreeableness, and neuroticism. The Big-5 personality traits are the best accepted and most used model of personality in academic psychology and have been found to affect career choice and work performance (Personality Traits and Entrepreneurs 2020). When examining for entrepreneurial intent or orientation, several additional traits have been merged with the Big-5 including self-efficacy, innovativeness, locus of control, and risk attitudes (Kerr et al. 2018).

Though the study of entrepreneurs' personality traits has been extensive in the last several decades, few would claim it is an unambiguous topic or precise science. There are many reasons for the individual's choice to become an entrepreneur. While there is a heavy emphasis on risk-taking or risk tolerance, when two entrepreneurs are compared, one must consider their back story. One entrepreneur may have zero risk aversion because he/she comes from wealth, while another has financially bootstrapped him/herself taking major risks. Which of the two entrepreneurs would be defined as truly a risk taker? As a heterogenous group, there many confounding socio-demographic variables such as stage of life, culture, and geographic location to name a few that can influence entrepreneurial personality and behavior. Gartner (1988) warned against testing for the ideal traits as they do not exist. "Research on the entrepreneur should focus on what the entrepreneur does and not who the entrepreneur is" (p. 21). Many do not share this view and would argue that being an entrepreneur is all about personality traits. It is these noncognitive skills, such as personality traits that predict entrepreneurial behavior in creating and managing a business venture (Sorgner 2015).

Beyond the "Big-5," when it comes to discussion about an entrepreneur's personality traits, there is no shortage of descriptive terms. Researchers, bloggers, academics, and entrepreneurs themselves have ascribed a multitude of

traits to the entrepreneur. Following is a cursory description of some of these traits.

1. **Achievement Motivation** is an individual's need to meet goals, receive feedback, and experience a sense of accomplishment. It usually refers to a level of an individual's motivation to engage in behaviors with the expectancy of success and its commensurate reward (Stewart and Roth 2007). This need for achievement is causally related to entrepreneurial persistence (Wu et al. 2007).
2. **Locus of Control** (Internal and External). According to Mirowsky (1995), the sense of control has two loci, internal and external. Those who possess an external locus of control tend to believe that having good luck plays a role for the good things that happen in life. They feel little control over their lives because external influences such as chance, fate, or environmental elements are at work. Those with an internal locus of control such as entrepreneurs believe they are in control of outcomes and that they are responsible for their own successes and failures. Their future is determined by their choices. They view that their decisions alone control their fate. Serendipity or luck is influenceable by their actions (Dew 2009).
3. **Resilience**. The three dimensions of resilience are hardiness, resourcefulness, and optimism, and resilience could be a key factor in the explanation of entrepreneurial success (Ayala and Manzano 2014). Based on the number of businesses that fail in the first five years, it is a small wonder how many entrepreneurs will begin again and start another venture. Successful entrepreneurs have endurance. Despite the number of rejections from banks or investors, they will figure out a workaround, problem solving through resourcefulness while maintaining optimism in their idea.
4. **Risk Taker.** Risk taking has become synonymous with entrepreneurship and that one must not be risk adverse, or immune to uncertainty to become an entrepreneur. Most entrepreneurs spend their own capital, forego paychecks, place their reputation on the line, and invest an abundance of time to make their dream happen, or not. All risks are not equal. Some are ambiguous risks with knowns and unknowns. Some risks are fraught only unknowns. Risk taking is often misconstrued as blind faith when in fact, most entrepreneurs attempt to minimize their risk through careful analysis. They examine the downside versus reward and whether the risk is merited. The ability to calculate risk is a valuable tool for both success and lessons learned from failures. Given that humans are inherently risk adverse, risk taking can differentiate the entrepreneur from others unwilling to take the risk. However, according to Cheng (2019), while personality traits do influence one's ability to take risk, the propensity for risk taking does not always translate to business success.
5. **Creativity** has increasingly been recognized as a driver of competitiveness, innovation, and major contributor to economic development. Artistic creativity is associated with imagination, idea generation, and an ability to see and interpret things differently (Del Monte and Pennacchio 2020). An entrepreneur's mind revolves around innovation, generating ideas, seeing patterns, developing novel approaches, and recognizing when a niche market opportunity is present. Entrepreneurs create things, are doers, and like the challenge of discovering new solutions. In entrepreneurship, creativity refers to the source of inventiveness, developing new products, services, and new operational ways.
6. **Curiosity** is "defined as a cognitive process of self-stimulation by divergent or contrarian thinking, in the absence of any external cues like a market need—is both necessary and sufficient to motivate entrepreneurs to begin the creation process" (Berlyne 1960). Curiosity drives innovation by thoughtful exploration, solution seeking, and thinking outside predefined parameters. It enables entrepreneurs to be engaged in the world, observing how things work, how they might be improved, and possessing an openness to new possibilities. Such openness does not approach possibilities with preconceived assumptions,

historical references, bias, or prejudice. It emulates the perfect state of a child's mind exuding inquisitiveness.

7. **Self-Awareness** is our conscious knowledge of our strengths, weaknesses, feelings, motivations, desires, and character. In a longitudinal study, Eurich (2020) queried thousands of people over several years about self-awareness. While 95 percent believed they were self-aware, Eurich posited that only 10–15 percent are. Self-awareness involves the ability to communicate effectively, to influence, to possess emotional intelligence, and to foster collaboration. When one is in possession of self-awareness, it will contribute significantly to an entrepreneurial endeavor. A self-aware leader is willing to share recognition, listens to perceptions of others, and is open to change (Jastzabski 2020). Entrepreneurs who understand their own strengths and limitations are better equipped to leverage this knowledge. They apply what they know and delegate work that requires the skills they lack. When one is self-aware, he/she is in a better position to give feedback, open to receive it, and have meaningful communication.

There are many other descriptors used for an entrepreneur's personality traits. Such words include dreamer, visionary, decisiveness, doers, tenacity, determination, passion, dedication, daring, bold, devotion, discipline, flexibility, empathetic, open-mindedness, communicative, confident, self-motivated, process oriented, and charismatic, among others. Entrepreneurship requires overconfidence, believing one is better than everyone else (Wharton University of Pennsylvania 2015). There is some confusion that introversion connotes a lack of confidence and many assume that entrepreneurs must be extroverted to be successful. This is inaccurate. Introversion and extroversion are not absolute values of either one or the other, but a matter of degree on a continuum. There have been many self-proclaimed introverted entrepreneurs such as Bill Gates, Warren Buffet, Elon Musk, and Mark Zuckerberg who have exercised the much-needed skills of problem solving and confident decision making (Castrillon 2019).

When an entrepreneur builds a business, it is typically "their baby" and will acquire many of the values and characteristics of the builder. As the business evolves, the entrepreneur's personality traits may shift as well. For example, during the start-up phase, the individual may be more of a risk-taker believing he/she has nothing to lose. As the business matures and the entrepreneur ages, he/she may become more risk averse knowing there is something (financial, reputation, etc.) that can be lost. As entrepreneurs scale their business, these changes will require them to adapt to a changing environment. Personalities, priorities, and values may shift through new social interactions, experiences, and rethinking operations (Ekinci et al. 2020).

## Personality Traits and Gender Differences

The number of female entrepreneurs has steadily increased worldwide, but women are still behind men as entrepreneurs (Business News Daily 2020). With women almost equal in number to men globally, the question of why there are fewer women entrepreneurs needs exploration (United Nations, Department of Economic and Social Affairs, Population Division 2019). There is a sense that many women may be disinclined to becoming entrepreneurs because of its ultra-masculine image (Personality Traits and Entrepreneurs 2020). Liquidity constraints, access to starting capital, and/or gender gap in risk aversion may also play an adverse role in female entrepreneurship (Sauer and Wilson 2016). According to Mollick (2015), gender is a strong predictor of whether one will choose to become an entrepreneur and women are less likely than men. As the number of women entrepreneurs grow, understanding the key differences between men and women and how those differences influence entry and approach to entrepreneurship will become increasingly important as a research subject.

When thinking about entrepreneurial personality traits, Mollick (2015) describes the "male hubris, female humility effect" which presents

across all cultures and ages. This effect posits that women have lower levels of hubris than men and men are more likely to be overconfident. Armed with this overconfidence, men are more likely to make a fundamental attribution error which ascribes ownership of success to their genius and failures to bad luck or some other outside forces.

Females demonstrate a higher level of optimism and internal locus of control than their male counterpart, but attitudinally shy away from debt (Vieira et al. 2020). While women tend to shy away from debt, men are more likely to borrow and get into more financial trouble. This may tie into Mollick's statement about male overconfidence. Men tend to display more individualistic tendencies while women rate considerably higher on interpersonal relationships. It should be recognized that these gender differences have long been assumed as social norms and they may exacerbate this perception (Personality Trait and Entrepreneurs 2020).

When compared to men, women have a considerably higher "communal tendency." This orientation might offer a route into entrepreneurship which radically differs from the conventional masculine approach founded on individuality. In emerging markets, this communal tendency is demonstrated with women reinvesting 90 percent of every additional dollar of income into the education, health, and nutrition of their families, whereas men contribute between 30 percent and 40 percent. Such contribution drives the wellbeing of family, community, and country and perhaps because of this, women entrepreneurs tend to be more successful because of their trusted status in the community (VanderBrug 2013).

In 2014, Bank of America studied (Business News Daily 2020) male and female entrepreneurs asking them to rate their strengths. Multitasking was listed by 58 percent of the women and 40 percent of the men. Women were 10 percent more likely to list creativity and 5 percent more likely to list empathy as key character traits for their employees. Men (30%) listed confidence as their strongest trait, while women (24%) listed it as such. According to Ayala and Manzano (2014), a key factor in predicting whether an entrepreneur will be successful depends on his or her resourcefulness. The ability to predict this success of those who have resilience and optimism differed between men and women. Optimism plays a much greater role on the success of their business for women than for men.

The entrepreneurial mind uses a dynamic mental model to assimilate environmental factors and opportunities to create new products, services, and business models. Confidence, intuitiveness, knowledge, and a dose of subjectivity will influence the process and the decisions made. Men and women are lured into entrepreneurship with ambitions of wealth, financial freedoms, control over one's life and career choice, and creating a legacy through achievement. There are differences between the genders. Yet research reveals that regardless of gender, traits such as ambition and a propensity for risk are inherent characteristics (Cheng 2019).

## The Entrepreneur and Family

There is a wealth of information on the history of families and entrepreneurship. Families and entrepreneurial processes have existed in antiquity playing an essential role as building blocks that have developed, maintained, and sustained societies (Danes and Zachary 2021). Many families have endeavored to create entrepreneurial enterprises achieving enduring success and creating generations of children who subsequently become entrepreneurs.

Entrepreneurial families have created iconic giants such as Walmart, Anheuser-Busch, Disney, and Roche. Research on how entrepreneurial families interact, function, build, and create succession plans has received an abundance of attention. Entrepreneurial family relationships have an impact on the business and its performance. The extent of the impact is dependent on the type of familial relationship. The entrepreneur–child relationship is the dominant dyad familial relationship in entrepreneurship (Adjei et al. 2019).

Perhaps a less explored topic is the entrepreneur's relationship to his or her family when they are not involved in the "family" business and how family members respond, adapt, and cope in being

along for the journey. When the entrepreneur is effectively operating the entrepreneurial endeavor as an individual, are there implications for the family of the entrepreneur? According to Business News Daily (2020), when entrepreneurs were questioned about how being an entrepreneur might affect their family, women respondents reported they were more likely to sacrifice time for themselves and their social lives for the sake of the business. Men reported that they were more likely to sacrifice time with the spouse/partner and children. Women were more likely to find work for their children and hire them within the company. Men thought it best that their children did not work at the company. A common lament from both men and women was that they did not spend enough time with their loved ones, and this was recognized as the top regret. Participants took solace in knowing they oversaw their career, were passionate about their work, and were producing a livelihood to support their families. Yet despite how entrepreneurs feel about their relationship (or lack thereof) with their family, those in the orbit of the entrepreneur (whether spouse, partner, parent, or child), who are not directly involved in the day-to-day operations, are still part of the entrepreneurial journey and have their own thoughts and feelings.

Later in this entry, there is mention of impression management, where to the outside world, the entrepreneur smiles and radiates a sense that all is right with the world because he/she is winning. Yet behind what is sometimes a mask, all is not all right, and the entrepreneur is suffering through personal struggles. Though he/she might try to conceal this underbelly from his/her family, the reality is that the family is intimately aware of the chaos, fear, and rollercoaster ride that is entrepreneurship (Hirshberg 2012). Without being in the *business of entrepreneurship*, families are still affected. The uncertainty of finances, emotional lability, highest highs, and lowest lows trickle down through family members. The entrepreneur turns the engine, and the family is along for the ride. Sometimes they are providing insight, comfort, and reassurance, and often serving as cheerleader. They can become mutual dream chasers or dream destroyers.

When homes are mortgaged, credit lines taken to their limits, and the victory dance seems a far-off reality, many marriages fail. Divorce lawyers estimate that entrepreneur divorce rate is five or ten percent higher than nonentrepreneurs (Smith 2017). If the only passion an entrepreneur has is for his/her business, then that business may get in the way of marriage. Many spouses or partners who join the entrepreneur for the adventure do not appreciate what they signed on to, nor do their children have any choice. For each billion-dollar entrepreneurial success story, there are millions of endeavors that have failed. Without care, the entrepreneur's ambitions become the central character of the story, perhaps sidelining the hopes and dreams of other family members. From the family member's perspective, the despair, stress, anxiety, emotional neglect, and anger make it incomprehensible to understand the entrepreneur's optimism that success is on the way (Hirshberg 2012).

There are many cautionary tales that advise those who undertake the entrepreneurial lifestyle to create a plan with their family. This means including family as a priority in the plan. Making time that cannot be broken or rescheduled, ensure communication is open, honest, and real. To assuage financial upheaval and uncertainty, place money for family goals such as education, vacation, or other priorities that cannot be accessed no matter how dire the company's needs. Being an entrepreneur may not be for the faint of heart. Being part of his/her family may not be for the timid as well.

## Leaders, Managers, and Entrepreneurs

When we hear or read about successful entrepreneurial startups, often people think that the entrepreneur is young, single, or perhaps dropped out of college. The founders of such companies as Microsoft (Bill Gates, 23), Facebook (Mark Zuckerberg, 19), and Apple (Steve Jobs, 21) met this description. Some might deem these founders as outliers and indeed, their accomplishments given their age and experience level make them exceptional. Their stories are daring and bold, perpetuating the misperception model of *true* entrepreneurs. The reality

is that most founders garner work experience before starting their own company. According to Azoulay et al. (2018), the average age for high growth start-ups was 45 years old. Through previous employment, entrepreneurs learn many skills that will be useful when they launch their own company. In addition to entrepreneur, they will serve as leader, manager, and supervisor. Without this prior experience, it is challenging to learn these skills as they go. Possessing business talent, the practical intelligence, and street savvy, one earns in the trenches of employment can discern successful entrepreneurs from those who fail. While intelligence is an important component, sometimes it is not enough to learn vital skills on the fly (Sharma 2019).

Many entrepreneurs possess personality traits such as openness, conscientiousness, vision, extraversion, and agreeableness that are necessary qualities for leadership. Yet translating these skills into actionable people management may be fraught with challenges. Having a vision and creating a business does not necessarily ensure the entrepreneur will be a good manager of people, know how to run the business, or instinctively be a great leader. Good managers not only oversee their own responsibilities, but can set clear priorities, communicate, and delegate tasks efficiently to their team. In many start-ups, entrepreneurs wear many hats and do many jobs. Their hands-on experience, fast paced mind, and knowing how to "get it done" drive many entrepreneurs to do it themselves rather than delegate. There is a degree of frustration in an employee's learning curve and inability to perform at the desired level of satisfaction. Entrepreneurs have a higher achievement motivation than managers and this can influence their annoyance with employees (Stewart and Roth 2007). Because the entrepreneur is willing to do whatever it takes, he/she may overestimate the quantity of work expected from employees and how many hours they must commit.

Being an entrepreneur is not necessarily synonymous with inspirational leadership or natural born leader. Without the appropriate people, social, and communication skills, the best visionary cannot convert an idea into reality unless he/she intends to do it alone. Many successful entrepreneurs learn these soft skills through trial-and-error lessons while employed elsewhere. When they are ready to launch their own business, managing people skills will shorten the learning curving, lift the burden of doing all the jobs, and perhaps increase opportunity for success. Good managers delegate and get out of the way.

Possessing passion and vision, many entrepreneurs think each employee must be imbued with the same beliefs about the company. Believing in their brilliant idea, entrepreneurs may think employees will follow them. They confuse their mind-set and motivations with that of an employee. Employees may not have the same aspirations. It is after all, not "their baby." If employees are not quite as enamored, entrepreneurs may misinterpret this lack of enthusiasm for disloyalty or incompetence. Rather than use matched enthusiasm as the litmus test for employment, leaders are better served to communicate goals, explain how they fit into the larger picture, and recognize an employee's contribution when it occurs.

Unlike employment where coworkers were friends and peers, founders are now the boss with no one to vent to and are often alone. Getting a company off the ground has many moving parts and many emotions. Chief among them is fear. Fear of failure, of being perceived incompetent, of losing credibility and authority (Jalali 2015). When leaders manage from a place of fear, it usually results in a self-fulfilling prophecy of failure.

Perhaps one of the greatest challenges confronted by entrepreneurs is finding qualified talent to help get the company off the ground. Without adequate capital to attract and pay experienced staff, entrepreneurs may bootstrap their staffing by hiring less skilled employees. Often, entrepreneurs will bring in family members, friends, school mates, and others to fill in positions for which they are not qualified. As the company grows and is better positioned to hire talent, the entrepreneur tends to fear losing friends and upset family ultimately avoiding the tough decisions to change out roles and fill the jobs with qualified candidates. Additionally, if the entrepreneur is not self-assured, he/she may be threatened by candidates who are smarter or possess different skills and avoid hiring top talent.

## The Darker Side of Entrepreneurship

The word entrepreneur conjures images of wealth, success, and self-confidence. Indeed, some synonyms include magnate, mogul, and tycoon. We admire or idolize figures such as Bezos, Zuckerberg, Musk, Branson, Ellison, Cuban, Gates, Jobs, Orpah, and others as iconic heroes who as entrepreneurs seemingly became billionaires overnight. Their stories are inspirational, prompting many to enter the entrepreneurial fray. These giants make it look easy. But nothing could be further from the truth. Without doubt, each of these figures has put in countless hours, endured challenges, made sacrifices, and perhaps experienced emotional turmoil. It is the side to entrepreneurship to which we turn a blind eye and perhaps, an unwillingness to accept that our heroes have vulnerabilities. It is the underbelly of entrepreneurship we tend to gloss over.

Despite the positivity associated with entrepreneurship and entrepreneurs, it is equally important to examine and understand their cognitive, affective, and behavioral vulnerabilities. In a 2015 study, Freeman, Johnson, Staudemmajer, and Zisser reported interesting, yet alarming statistics. Of the entrepreneur participants, 72 percent self-reported mental health concerns. "...entrepreneurs were significantly more likely to report a lifetime history of depression (30%), ADHD (29%), substance use conditions (12%) and bipolar diagnosis (11%) than were comparison participants" (Freeman et al. 2015, p. 3). Societies do an extraordinary marketing job in promoting entrepreneurship. There is a perception that being an entrepreneur is an exciting, fast-paced, adrenaline pumping profession, and rewarding. Still, many do not consider the darker mental and emotional toll this pressure can take. As exciting and glamorous as entrepreneurship sounds, there are reasons why many who might consider becoming an entrepreneur, do not. According to Gustafson (2020), the failure rate for small business is frightening.

Given these statistics and the associated stress, why would anyone want to adventure into entrepreneurship? Generally, entrepreneurs overall have lower long-term earnings, increased stress, and psychosomatic health issues. Their lifestyle is dictated by the needs of their company working longer hours, holidays, and weekends. There is chronic stress and uncertainty in addition to a greater investment of psychological, emotional, and physical resources (Freeman et al. 2015). For many there is no turning off the company when the entrepreneur turns off the lights. Work follows the individual home, dines with him or her, invades dreams, sits at children's sporting events, and needles its way into nearly every facet of the person's life because in many ways it is the entrepreneur's life.

Most of us take pride in our work, careers, and the jobs we do. Many of us derive our sense of worth and/or identity from our jobs and subsequently our titles. However, when our name is not on the building or associated with the creation of the company, if things go badly, we may take comfort that we are an employee, not the founder. For many entrepreneurs, their company is their identity and if it fails, it is personal. Yes, resiliency is one of the personality traits that distinguishes entrepreneurs, but they are not superhuman or bullet proof. When companies falter, payrolls cannot be met, dreams crumble, reputations are shattered, or there is responsibility for others to lose their livelihood, it takes an emotional toll. Trying to maintain a dynamic growth trajectory for one's company may become untenable, causing the entrepreneur to feel trapped. It is in these circumstances when some may feel there is no alternative but to commit suicide (Gourguechon 2018).

There is a paucity of data on the suicide rate of entrepreneurs. The deaths of famous entrepreneurs such as Anthony Bourdain, Angad Paul, Kate Spade, VG Siddhartha, Ilya Zhitomirskiy, Lucky Gupta Agarwal, and Aaron Swartz put a face on the phenomenon and begin to shed a light on the struggles even successful people have with depression, anxiety, and an inability to live up to unreal or self-imposed expectations. Few can live under a constant state of stress, uncertainty, and a rollercoaster of emotions without fissures surfacing. According to Gourguechon (2018), entrepreneurs are at greater risk given their convergence with traits associated with heightened suicide. These traits include impulsivity, depression, social isolation, and humiliation, rejection, and failure.

Behind the façade of confidence and success may be someone suffering in quiet despair hoping their world, their work does not disintegrate. The maxim, "Fake it until you make," perpetuates impression management, how we control or influence other's perceptions of us. Many entrepreneurs will attempt to look successful by driving a luxury car, wearing designer apparel, and/or picking up the bill for meals, all of which are beyond their financial means. The perception of success does not equal reality and maintaining the impression of success increases the stress. "...common sense says that the high-stress life, enormous uncertainty, exhaustion and risk of humiliation that every entrepreneur endures makes a case for increased caution" (Gourguechon 2018). The business endeavor and its creator are inextricable linked and perhaps psychologically one and the same. If we experience failure as an employee, though disappointing it may not be felt at the same personal level of loss as an entrepreneur. Hard work is often required to succeed, but it does not assure success, and entrepreneurship is no exception. Rarely do entrepreneurs publicly discuss what is known as "entrepreneurial terror, an all-encompassing dread that comes from nowhere and throws its coils around you like a python ready to feed" (Rao 2013). While there are numerous benefits to entrepreneurship, we are also best served to be mindful to its downside.

## Exploring Facets of Entrepreneurship

In about 1800, French economist Jean Baptiste Say coined the term Entrepreneur – which literally means adventurer (Beattie 2019). According to Hayes (2020), entrepreneurs are people who create new businesses, bear the brunt of risk, and enjoy the rewards. These individuals are commonly seen as innovators, who develop new ideas for products or services for the market or introduce new operational procedures. However, when we try to define who is, and who is not an entrepreneur, answers become subjective. Some will say that being an entrepreneur is not an occupation. Still, others would state that being an entrepreneur should be considered a profession just like lawyers, doctors, and accountants (Caan 2014). The definition of what constitutes an entrepreneur is at times quite murky and is often confused with self-employment (Martinez et al. 2007). There are a variety of individuals such as medical professionals, contractors, consultants who establish a new business, take risks, are self-employed but would not be considered entrepreneurs. Many practicing law, medicine, dental, or architecture establish practices based on historical stability, and short of malpractice, have minimal downside risks. Gartner (1988), "... disapproved of the varying definitions being used for entrepreneurship, preferring to focus on a definition that emphasized the functional creation of new organizations." What defines a "new organization" may be up for debate. Organizations vary from offering to revenue to number of employees. Moreover, some begin a company without intention to grow into a larger organization or chain. For example, a local florist or baker. Their founder would however meet many of the criteria for entrepreneur.

Entrepreneurs may be born from opportunities, or from necessity as is evidence in many parts of the world. Despite all the coverage about entrepreneurs and their optimism, most fail. Still, many are willing to join the ranks (Sharma 2019). Perhaps the study of entrepreneurship becomes less about the traits of the individual and more focused on the how he/she built a lasting organization (Gartner 1988). A nascent body of research is emerging that suggests more affluence is positively correlated with entrepreneurship because if affords greater accessibility to capital and liquidity. This is not to suggest that only family wealth or inheritance will fuel entrepreneurs. Many save funds in preparation for his/her entrepreneurial endeavors (Sauer and Wilson 2016).

## Franchising and Entrepreneurship

After a series of diverse jobs, Ray Kroc joined McDonald's as a franchise agent. Under his leadership and vision, he built McDonald's into one of the most iconic, successful fast-food operations in

the world. Kroc is recognized for making many innovative changes in the food-service franchise model. Few would argue that Mr. Kroc was indeed an entrepreneur in every sense of the word. Today, for a minimum of $500,000, one can purchase a McDonald's franchise (McDonalds.com 2020). Some would argue that the franchisee is an entrepreneur while others would state he/she is a business owner. After all, aren't entrepreneurs the ones to have the idea or innovation around which they build their business and take all the risks to succeed? This question demonstrates the ambiguity in the definition.

## Disruptive Innovation

Entrepreneurs see openings in the market that are often overlooked or discarded as nonviable. Spaces where they plant their ideas and the roots of business take hold. According to Si and Chen (2020), the disruptive innovation theory introduced by Christensen twenty years ago and has since been applied to many incorrect scenarios. "... there is inconsistency between the theory and the real business practice" (p. 1). Without careful application and understanding of this theory, it is a terminology that can quickly become a buzz word. In its original explanation, "disruptive technology" mainly referred to types of technology that while inferior to the main features consumers valued, alternatively offered some overlooked elements. Over time, these new technologies eroded market share to surpass the dominant technologies in specific markets. "Disruptive Innovation describes a process by which a product or service initially takes root in simple applications at the bottom of a market—typically by being less expensive and more accessible—and then relentlessly moves upmarket, eventually displacing established competitors" (Christensen Institute 2020). Examples of disruptive companies include TurboTax, Airbnb, Netflix, and Amazon. These entrepreneurs saw an entry point at the low end of the market, serving customers that might otherwise have been deemed nonprofitable by their respective industry, and over time dominated the market.

## Industry Improvement

In 2013, purchasing a medallion for a yellow taxicab cost upwards of one million dollars. Some might consider these cab drivers entrepreneurial taking on the risks of self-employment and debt to make the purchase. Others would say there was little risk associated with the iconic yellow cabs of New York. In 2019, these same taxi medallions could be purchased between $120,000 and $150,000 (Parra 2019). What happened? In 2009, Uber founders, Kalanick, and Camp built a platform that matched empty seats in cars with customers going in the same direction. The company evolved into dedicated drivers taking customers to their desired destination becoming a large contributor to the gig economy of contract workers. At face value, many would think Uber was a disruptive innovation and many medallion owners would agree. However, Uber does not meet the criteria. They did not enter the market at a lower price but targeted the same customers of the yellow cabs. Their business model is about sustaining innovation, incrementally improving an existing industry.

Disruptive or not, these entrepreneurs saw opportunity. Malcom Gladwell (2002) posits that the successful entrepreneur carefully assesses the situation, sees an opportunity that most others do not see, and seizes upon it. If we focus on innovation as a requirement, does setting up a hotdog stand, qualify the vendor as an entrepreneur, or is he/she a business owner? Few would argue that Jon Carder, who as a child set up a hotdog stand, continued with a series of ideas, and became a millionaire by 27 years old is an entrepreneur (Cremades 2019). The line of distinction between business owner and entrepreneur can at times become blurred. Are food truck owners or franchisees any less of an entrepreneur than a brick-and-mortar restaurant owner?

## Offshoot Industries

Those who teach entrepreneurship, coach entrepreneurs, and/or write books, blogs, and academic articles about them may very well be

entrepreneurs themselves. Recognizing the opportunity, analyzing its potential, and seizing upon it, many have created offshoot businesses based on entrepreneurship. Various universities teach about entrepreneurship, provide tutorials on how to become one, and guide budding entrepreneurs through experiential programs. It is big business to encourage and educate would-be entrepreneurs. An entire industry of books, magazines, blogs, and countless articles have been written on the subject. Innovative entrepreneurs have created software tools, coaching sites, and constructed new personality tests to gauge whether one has what it takes to be an entrepreneur.

## Conclusion

To understand the entrepreneurial mind, we must recognize that the subject encompasses more than personality traits and should be examined from a multifaceted approach. Gender, culture, socio-demographics, and other elements contribute to how entrepreneurs think about themselves, others, the definition of entrepreneurship, and how they set out to create business from an idea. Along with the highs of success, there is a darker side that is not discussed as frequently. There is no clear synthesis on the subject because no two minds are exactly alike. Longstanding debates on whether entrepreneurs are born or made or whether business owners are entrepreneurs will continue. Perhaps entrepreneurship is like art and as such, has a degree of subjectivity and opinion. Though this entry covered a broad variety of elements that might influence the entrepreneurial mind, it will not resolve many of the outstanding debates on the subject. Instead, perhaps it will stimulate more thought for the entrepreneurial mind.

## Entrepreneurial Mindset Among the Youth in Sub-Saharan Africa

Joseph Mpeera Ntayi[1], Beatrice Nyakeshiki[2], Nantongo Nabiira[2] and Musa Mbago[2]
[1]Faculty of Economics, Energy and Management Science, Makerere University Business School, Kampala, Uganda
[2]Department of Procurement and Supply Chain Management, Makerere University Business School, Kampala, Uganda

### Synonyms

Frame of the mind; Mental attitude; Mental processes; Mental set; Mentality; Outlook; Psyche; State of mind

## Definitions of Terms

Mindset is a habitual or typical mental attitude that determines how people will construe and react to situations.

Learning environment refers to the diverse physical locations, contexts, and cultures in which the youth learn.

Scaffolding refers to the process in which a person is assisted to achieve a task by performing it on his or her own.

Cognitive Heuristics: Heuristics are mental shortcuts that allow individuals to make decisions, pass judgments, or solve problems quickly and with minimal mental effort.

## Introduction

In 2019, Africa was the world's youngest continent with almost 60% of the population under the age of 25 (Ibrahim Forum Report 2019). More than a third of Africa's population is aged between 15 and 34. If the population continues to grow at the same rate, Africa's youth population is estimated to be equivalent to twice Europe's entire population by 2100. A youth is defined as any individual in the 15- to 24-year-age bracket (The International Labor Organization [ILO] 2014). Between 2013 and 2017, 50% of the countries in sub-Saharan Africa registered a worsening education outcome and a widening mismatch between education and employers' needs (Ibrahim Index of African Governance 2018). Many sub-Saharan African countries have restructured their education system downgrading vocational education in favor of university education. For example, in 2017, only 1.1% of 15- to 24-year-old in sub-Saharan Africa participated in a vocational education program. The failure for sub-Saharan African countries to develop programs that prepare the youth for smooth transition from school to work may have significant implications for the existing youth entrepreneurial mindset which we attempt to discuss in this paper.

Across the continent, African governments continue to ignore the increasing unemployment rate among the youth with advanced level education, thereby delaying the associated governance challenges for the host communities. The Ibrahim Forum Report (2019, p. 33) states that "Due to a lack of formal jobs and social safety nets, many young Africans have to find an alternative in the informal sector in order to get by; getting trapped in a precarious employment status which contributes to a delayed transition to adulthood ('waithood')." Unfortunately, the advent of the Corona virus disease (COVID 19) pandemic in 2019, a worldwide public health emergency, affected the informal sector negatively, leaving the youth with minimal and/or no alternatives for survival. The increased economic and social pressures during the full/partial lockdown measures to prevent the spread of COVID-19 have put a number of African youths under intense mental distress, contemplation of suicide, risk of contracting sexually transmitted infections, and unwanted pregnancy resulting from forced or pressured sex and sexual exploitation. The effects of COVID 19 on the economies of sub-Saharan African countries require a serious reexamination and discourse of the youth entrepreneurial mindset.

This paper adopts a definition of the ILO to abstract and attempt to explain the youth entrepreneurial mindsets in sub-Saharan Africa. The focus on the youth is based on the fact that: (a) they largely constitute a big percentage of the rapidly growing African population; (b) the high prevalence of the youth unemployment rate in Africa is estimated to range from 60% to 88%; (c) the youth are getting better educated through higher access to primary and secondary education, thereby creating a stronger attention on job creation; (d) the possibilities for African countries to utilize the existing resources to harness and tap the potential in the youth population in the economic transformation of the country; (e) the presence of the entrepreneurial spirit among the youth, with the majority aspiring to start their own businesses, rather than pursue careers in law, teaching, medicine, or engineering; and (f) African youth lack trust and integrity. Despite their growing entrepreneurial ambitions, the African youth generally exhibit low scores for integrity and do not seem to associate hard work and success with

education. For example, the Uganda Youth Survey Report (2016, p. 2) states:

> 56 percent of the youth believe that it doesn't matter how one makes money as long as one does not end up in jail; 55 percent admire those who make money through hook or crook, (including hustling); 33 percent believe corruption is profitable; 73 percent are afraid to stand up for what is right for fear of retribution; 40 percent of the youth would readily take or give a bribe. Only 27 percent strongly believe that it is important to pay taxes.When asked what they value most, 79 percent valued faith first, 47.5 percent valued work first, 39.6 percent valued family first and 37.6 percent valued wealth first, and 25.7 percent valued freedom first. Only 5.6 percent valued integrity first.

The youth in Africa possesses a creative mindset, is highly motivated to succeed, yet open to risk and failure. They exhibit high, fascinating ambitions, values, identity, and behavioral orientations which shape the perspectives through which they perceive, interpret, and construct reality. This personal construction of reality explains the formed youth mindset which derives from the predominant views that reside in the minds of the African youth suggesting the character of the next-generation Africans. In this paper, we conjecture that the explanations of the youth cognitive structure are associated with personal constructs associated with their experiences, the learning environment (supported by kinship ties, friendship ties, incomes, education, social structures and system and rural–urban divide, and COVID 19), cognitive heuristics, instructional support, reflexive entrepreneurial framing, and career decision-making self-efficacy. Anecdotal evidence suggests that the youth entrepreneurial challenge is rooted in the education system, which heavily focuses on the hard skills and memorizing the curriculum, thereby disadvantaging the youth from being problem-solvers, creative and critical thinkers, and independent and self-driven.

The cognitive constructions exhibited by the African youth and their resulting actions are a reflex for survival. This has resulted in search of meaningful work in terms of seeking employment or creating business ventures. When faced with complex situations, the youth tend to alter their previous beliefs, thoughts, or habits to address new situations. As such they develop the mental ability to embrace challenges, finding lessons and inspiration in the success of others. It is these success stories with the associated persuasive endorsements, value affirmations, and social resources that provide the learning environment and inspiration for making decisions regarding their careers. This is an important task for young people in determining their life and career trajectories. The career decision process of the youth begins to occur early in life when they are attending their primary and/or secondary school education. However, it is possible to find some youth who develop their career interests later in life with major life span events. It is these life span events that help the youth to face new and unexpected conditions in their environment, and confers the ability to see new patterns and new solutions to life challenges. This is a common observable phenomenon among the Ugandan youth who are committed to career paths involving long periods of education and training with diminutive chance of employment success. As a result, the confidence the African youths have in their capacity to explore, select, and pursue their lifetime career-related dreams and creative mindset is diminished (Solberg et al. 1994).

Literature has tended to attribute the youth employment and entrepreneurial challenges to their mindset and the "mismatch between university graduates' skills and the needs of potential employers" (Barber et al. 2013, p. 78). Despite these observations, research on youth entrepreneurial mindset is largely anecdotal, speculative, and sparse, yet cases of growth entrepreneurial mindset have started to emerge as illustrated by the case of Patrick Ngowi – the young entrepreneur who built a multimillion-dollar business from solar energy (source: Adapted from http://www.smallstarter.com/get-inspired/patrick-ngowi/).

At just age 15, and still a student in secondary school, Patrick Ngowi ventured into the mobile phone business selling call cards (recharge vouchers) which he noticed were scarce in the area. By the time he turned 18, he was fully into the mobile phone trade selling cheap handsets which he bought from Hong Kong. This business, which he started with a $1,800 loan from his mom

and a free air travel ticket from a close friend, turned out to be very profitable. By targeting the mass market of poor rural people who could only afford basic and cheap phones, Patrick sold more than 5,000 handsets (at an average price of $20) in 1 year alone! During his short stint in the mobile phone business, Patrick noticed that many of his customers did not have access to electricity and getting their phone batteries charged was a serious problem. This problem provided the inspiration that opened his eyes to the huge potentials of solar power and the lucrative opportunities it holds in Africa's future. Patrick quickly changed his thinking about business and reconstructed his frame of reference to find solutions to the challenges faced by his customers. He devised a new strategy and started developing his entrepreneurial abilities to grow this new business which later defined his career life trajectory. Patrick strongly believed that he was in charge of his career trajectory and had control over his business outcomes through determination, hard work, and persistence. To prepare himself for this future, Patrick went ahead to seek knowledge and finely tuned skills that were built around a solid knowledge base of solar energy that he continually updated in order to build the solid technical knowledge he needed to succeed in the solar power business he would soon start.

At age 19, Patrick Ngowi had saved enough money to enroll in Dezhou University, China, where he studied renewable and alternative energy (with particular emphasis on solar power). During his studies, Patrick met supportive peers and mentors who were passionate in delivering knowledge and life skills. The university curriculum was interactive and experiential often characterized by practice. Patrick recounts his experience: "At Dezhou University we actively participated and supported each other in learning." We had constant workshops, field trips and industry visits, role plays and theater group work and discussions, story design and storytelling, and community service projects. Learning was both serious and fun. Patrick narrates that Dezhou University offered a conducive learning environment that provided reference materials for the solar business, career information on renewable and alternative energy. The university setting, workshops, and theatres were characterized by free discussions, highly encouraging and confidence-building tutor–student interactive encounters, and problem-solving and constructive feedback. It is these life experiences that changed Patrick's capacity to explore, adapt to changes in the energy market, select and pursue life career dreams, accept constructive feedback, understand and manage his emotions, improve his creative thinking skills, and engage in lifelong learning remain open to new career experiences.

Patrick E. Ngowi returned to Tanzania, where he created Helvetic Solar Contractor, a company that has now installed more than 6,000 small rooftop solar systems in his country and four other East African countries – Kenya, Uganda, Rwanda, and Burundi. Many of these systems are installed in the same communities he sold his mobile phones (which had no access to the electric power grid). The company started with photovoltaic equipment sales in the field to administrations and companies. Then, partnerships with international institution such as the UN allowed the start-up to extend to the whole country. It now offers a wide range of products on an e-commerce platform. Helvetic Solar Contractor also offers a quality maintenance service of the commercialized equipment. It is now part of a Helvetic Group, which has other subsidiaries in the wind energy and waste processing sectors. The company boasts of a strong revenue base which now exceeds $7 million. This astounding success has also attracted a lot of media attention Patrick's way. In early 2013, he was featured by Forbes as one of the 10 Young African millionaires to watch. His company was also ranked at the top of KPMG's East Africa's Survey of Top 100 Mid-Sized Companies in Tanzania in 2012. Although renewable energy (like solar) makes up about 1% of Tanzania's electricity sources, Patrick's company already boasts of high-profile clients like the United Nations, the Tanzanian government, World Vision, and the Tanzanian Army.

To date, Helvetic Solar Contractors has installed more than 2,000 solar water heating systems in government institutions and several UN projects including schools, hospitals, and hotels.

This is in addition to several solar power contracts the company is executing in other East African countries such as Kenya, Uganda, and Rwanda. Patrick currently works with and promotes the brands of leading manufacturers of solar panels and equipment in the USA, Europe, and China. The product range he offers includes: solar water heaters, solar batteries, solar mini-generators, street lights, gadgets, power back-up systems, accessories, solar fridges and freezers, charge controllers, and other renewable energy alternatives. His company has also branched into other alternative energy services including handling, supply, installation, and maintenance of hydro turbines and thermal systems throughout East Africa. Apart from his remarkable entrepreneurial achievements, Patrick is a passionate environmentalist and a passionate philanthropist. Through his "Light for Light (L4L) Foundation," his company offers Helvetic Solar kits that provide rural households with basic lighting and power to charge mobile phone batteries – a project he partly funds from his personal salary. According to a recent interview with the African Business Journal, Patrick considers his greatest achievement to be his ability to reconfigure his mindset to provide much needed employment for his fellow citizens, and at the same time, light up some rural parts of Tanzania with solar power – as well as contributing towards Tanzania's advance in renewable energy.

This paper attempts to abstract an impressive story of Patrick Ngowi's reality and provide a theoretical explanation using Vygotsky (1978), zone of proximal development. The zone of proximal development (ZPD) is defined as "the distance between the actual development level as determined by independent problem solving and the level of potential development as determined through problem solving under adult guidance or in collaboration with more capable peers" (Vygotsky 1978, p. 86). The difference between the knowledge and problem-solving abilities displayed by Patrick when he was working independently compared with the decisions taken while he was in the company of supportive, passionate mentors after enrolling in Dezhou University, China, demonstrates the applicability of the theory of "zone of proximal development." The immense innovative, creative, entrepreneurial, problem-solving skills gained through free discussions, in the presence of highly encouraging and confidence-building tutor–student interactive encounters, changed Patrick's capacity to explore, adapt to changes in the energy market, and remain open to new career experiences. The learning experienced by Patrick patterns Vygotsky's conceptualization of the zone of proximal development. Vygotsky saw development as a decreasing gap between mental structures/functions of individual's actions and norms (cultural mediation for Vygotsky) as defined within their respective particular society (Matusov and Hayes 2000). This zone of proximal development is further replicated by Patrick's entrepreneurial growth mindset, from a simple electronics outlet to a multimillion-dollar photovoltaic business through the creation and management of wealth value creating venture. Patrick identified an opportunity from the energy problem that his clients exhibited by fixing his country's nagging electricity problem.

The theory of ZPD rests on the presence of mediation, scaffolding, and internalization which we observe in Patrick's story. Patrick's mindset and cognitive development is supported by the immense role played by the mentors and peers at Dezhou University. The instructional support provided by the university represents the "instructional scalloping." The instructional activities undertaken during training provided a conducive and interactive social environment, confidence, and resources to turn to for assistance. The supportive peers and tutors during training narrowed the gap between mentors and mentees giving Patrick the confidence to overcome fears regarding engagement in entrepreneurship. Mentees were assisted with any problem that arose in regards to photovoltaic energy business–related decisions. He deeply looked at himself and reflected at his future ability to make positive career decisions. Patrick was quick at internalizing photovoltaic energy business career through the process of problem-solving activities in the company of mentors; however, later, he tends to perform the tasks independently. It is worth noting that,

despite the importance of the ZPD in explaining the above situation, Patrick's unfettered decision to pursue the photovoltaic energy business and continue to grow largely remains unexplained.

The career decision-making self-efficacy tends to explain Patrick's decision to desist the temptations of the traditional career path of anachronism and undertake, revere, and cultivate his skills in entrepreneurship. Patrick learnt early in life that a career in solar energy business called for self-appraisal, gathering occupational information, goal selection, making plans for the future, and problem-solving. The career decision-making self-efficacy construct provides significant insights in explaining Patrick's career-related beliefs and career development (Betz 2004; Lent and Brown 2006). Patrick continued to develop his interdisciplinary skills through experiential learning that led to the development of an entrepreneurial mindset. His decision to enroll for a solar energy training program in china is goal directed and reflects a greater awareness of Patrick's strengths and weaknesses in pursuing his career dream. The solar energy degree program was instrumental in promoting Patrick's goal-directed career decision-making self-efficacy through the acquisition of photovoltaic energy-related information and reaffirming his career goals. Patrick gained confidence in his career decision, fine-tuned his career goals, and identified quickly pathways to his career. His refined career plan was broken down into manageable steps moving from electronics to solar energy projects. Patrick's decision to go for further training lends credence to the continuous self-appraisal which resulted into the development of hard and soft skills required to achieve career goals.

Patrick made his career decision early in life. He was always not only thinking about his entrepreneurial vision but also putting his entrepreneurial vision into motion, thereby displaying an entrepreneurial growth mindset. Noticing that many of his customers had no electricity to charge their phone batteries, Patrick saw the goldmine in solar energy. This means that Patrick had the ability to turn problems into opportunities, marshal resources, and create value. This is further supported by his decision to shift from supplying mobile call credit to local vendors in his community to becoming an importer and dealer in cheap mobile phones which he mostly sold to rural people. Patrick further displays his career readiness and persistence through maximizing his educational experiences. The confidence exhibited in his abilities to be an entrepreneur made Patrick to commit to lifelong career choices and become successful. Patrick's determination to grow and succeed at any cost prompted him to save money for his studies and choose a Chinese university that offered supportive training and other targeted learning opportunities.

Despite paucity of theory-driven empirical research explaining the youth entrepreneurial mindset, current efforts supporting youth mindset change in Africa has started to emerge. For example, SNV mounted the Uganda's youth employability through Enterprise and Skills Development (YES) project aimed at changing the mindset of youth in the West Nile region of Uganda. Previous studies on mindset have tended to be general taking a social construction perspective, placing knowledge neither within individual minds nor outside them, but between people. Current thinking does not discount these initiatives and the associated findings but simply builds on them to include personal construct theory and Vygosty scalloping perspective. Scaffolding provides a supportive and conducive learning environment to the youth to learn new content and solve problems. In a scaffolding learning environment, students are not only free to ask questions, provide feedback, support their peers in learning new material, and make themselves more responsible and accountable towards their duties but equally make them to move beyond their current skills and knowledge levels. Against this background, the paper takes the inextricably intertwined perspective of the personal and the social dimensions of human experience in anticipating and explaining the youth mindsets and actions. The paper attempts to combine the endogenic and exogenic epistemologies which emphasize the role of the individual mind and external reality respectively in the construction of the meaning of the youth entrepreneurial mindset.

This is consistent with Kelly (1955, p. 50) who postulated that "a person's processes are psychologically channelized by the ways in which he anticipates events."

The description that has been leveled against the African youths is that they are mostly unproductive (IYF 2011; OECD 2012; African Development Bank, Development Center of the Organization, for Economic Cooperation and Development, United Nations Development Program 2014), yet the increasing youth unemployment rate is a reflection of framing. Anecdotal evidences reveal a mass exodus of the youth from the rural areas to the urban areas in search of employment and survival based on factors that include kinship ties and friendship ties, rural incomes, role of rural education, and the rural social system. In this paper we contend that the learning environment, cognitive heuristics, instructional scaffolding, career decision-making self-efficacy, and reflective entrepreneurial framing affect and explain the entrepreneurial mindset of the youth in sub-Saharan Africa as presented in Fig. 1 and discussed under the subheadings below.

## Learning Environment

The learning environment in Patrick's case is positively associated with the youth entrepreneurial mindset. This suggests that training institutions, teachers, peer mentors, and parents that create learning environments that are both challenging and supportive to the youth make the youth to move to higher levels of cognitive, behavioral, and emotional engagement, thereby creating an intellectual and psychological entrepreneurial growth mindset. The youth with a growth mindset are free to ask questions, provide feedback, support their peers in learning new material, and make themselves more responsible and accountable towards learning. This makes them to move beyond their current skills and knowledge levels. The cognitively engaged youths enjoy learning and keep on discovering new knowledge. They get in touch with the lifelong realities, are flexible, and develop a mechanism for coping with failure. One of the most challenging areas for the youth in most African countries is the absence of a learning environment that motivates them to be physically ready and willing to learn, thereby impacting on the development of the youth entrepreneurial mindset. The learning environment equally determines the nature of the relationships developed between the youth and their facilitators, classmates, and the school and determines their abilities to make career-related decisions. This partly explains the absence of a serious youth entrepreneurial growth mindset. Additionally, many African countries have remained small open

**Entrepreneurial Mindset Among the Youth in Sub-Saharan Africa, Fig. 1** Promoting a Growth Entrepreneurial Mindset in sub-Saharan Africa

economies, with small businesses only able to access small credit (microfinance) to produce non-tradable products for low-income groups, thereby forcing everyone (bankers, insurers, service providers, etc.) to target small markets. As a result of this, the youth have since developed a micro mindset due to the prevailing learning environments which are predominantly agrarian and largely subsistence. Many youths grow up in a natural rural setting, surviving on gifts of nature. As a result, many youths grow up in relatively easy lives, freer and less affected by the vicissitudes of the capitalist economy. Subsistence peasants are associated with a fixed mindset not worrying about food prices, interest rates, inflation, or generally bills of any kind. Researchers have established "path determinations" that link today's youth mindsets to the past colonial economic distortions. The youth are socialized to think we can only cultivate a few crops, sell them to Europeans who possess the brains to transform them into finished products.

## Cognitive Heuristics

The association between cognitive heuristics and youth entrepreneurial mindsets means that the more the youth display a growth mindset the more they generally tend to use heuristics as mental shortcuts or rules of thumb designed to reduce the effort of performing an entrepreneurial task, basically by considering less information in the process. This may mean that the youth have considerable information which is considered difficult to comprehend and irrelevant for survival in a rapidly changing environment prompting them to use shortcuts. This has implications for training institutions that have been blamed to unleash curriculum that is considered abstract. The abstract curriculum tends to be associated with the youth fixed mindset. The youth who tend to ignore part of the information considered difficult to comprehend, with the goal of making entrepreneurial decisions quickly, frugally tend to exhibit a growth mindset. Those youth who have access to information considered useful tend to make well-guided entrepreneurial decisions which result into a growth mindset. However, the entrepreneurial decisions which are made without objective assessment are often inconclusive. The heuristic behavior of the youth leads to perceive low risk (Simon et al. 2000). This is especially true in environments which are resource starved. The youth entrepreneurial perceptions are made under uncertainty using their mental capacity to construe meaning and simplify to effect actions. However, Patrick's case reveals that mindset heuristics with a clear business goal is much more important than formal business plans which are recommended to constitute the basic starting point. The cognitive mechanisms of the youth help them to cultivate entrepreneurial mindsets. Patrick improved his perceptive ability during his studies in China. His creativity and critical thinking skills to discover opportunities over time were developed.

## Instructional Scaffolding

Patrick's case tends to reveal the fact that the youth entrepreneurial growth mindset is attained, when the youth work with peers or mentors who have a range of skills and knowledge. The highly skilled and knowledgeable peers or mentors are the "instructional scaffolds" who help the youth in accomplishing new tasks and developing their creative ideas they cannot typically achieve on their own. The mentors and/or peers improve the youth mindset horizons by creating confidence among the youth mentee and encouraging them to embrace challenges and persisting in the face of setbacks. This encourages the youth to learn new skills, scan the environment in order to find lessons and inspiration in the success of others, thereby discovering a world of opportunities. The "instructional scaffolds" provide learning support to the youth by helping them to connect entrepreneurship knowledge with real-life situations through hands on. Role models are able to create a sense of self-awareness, thereby promoting an entrepreneurial creative and growth mindset mentality of the youth. The youth are provided with authentic problems to solve. These authentic problems could utilize

noncontrolling language, provide meaningful cognitive choice, and help the youth direct their own learning. The use of threatening language during training should be avoided because it kills interest, hinders the development of interest and self-regulation of learning. Explanatory rationales should be used to help mentees see why doing the target action will benefit them (Reeve 2009; Su and Reeve 2011). This observation is consistent with Parsons and Ward (2011); Willems and Gonzalez-DeHass (2012) who assert that solving authentic problems is a key function in modern life and in most careers. The support provided to the youth largely depends on the beliefs that parents, guardians, and teachers hold about them – these can have a striking impact on students' achievement. The youths with the growth entrepreneurial mindset believe that their entrepreneurial abilities could be developed over time. They are determined to succeed however discouraging the circumstances are, focus on learning, and exhibit varying levels of resilience in the face of hindrances. Youth start their enterprises when their parents and trainers believe that entrepreneurship is not fixed, but can be developed over time. Teaching youth that entrepreneurship can be "grown" is especially powerful for the youth who belong to typically stereotyped groups. Having a growth mindset is especially important for the youth who are laboring under a negative stereotype about their abilities amidst unemployment, institutional, financial, and infrastructural constraints. Apparently, the youths in sub-Saharan Africa believe that schools make judgment on who potential entrepreneurs are or are not, and yet schools should be a place where people help the brains of the youth to grow new connections. These observations are consistent with Dweck and Leggett (1988) who aver that individuals with a growth mindset welcome challenges, viewing them as learning opportunities, and displaying a mastery-oriented response (Dweck 2015). Additionally, individuals with growth views seek out challenges and adopt learning goals without fear of making mistakes. These observations have employment implications for the youth in sub-Saharan Africa. This is mainly because, the informal and private sectors have the potential to absorb many unemployed youths, including those that live in the undeserved communities of sub-Saharan Africa because one of the biggest hindrances for the youth to start viable business ventures is lack of required skill sets to run viable business ventures. The youth need to learn how to figure out things on their own. There is need to mentor the youth to adapt to the prevailing tough economic environment by being more frugal and shrewder in enterprises. Through solving authentic problems the youth gain practical solutions that help equip them with the skills to create, manage, and engage in viable business opportunities. This would lead to wealth creation and youth empowerment through employment.

## Career Decision-Making Self-Efficacy

Patrick's story brings out a significant connection between career decision-making self -efficacy and the youth growth entrepreneurial mindsets. This suggests that the youth who have confidence in making decisions based upon their self-concept, goals, and career options will tend to achieve future career-related outcomes. Career outcomes and occupational goals result into creative and growth entrepreneurial mindsets. Making career-related decisions is a sign of career readiness or maturity focusing on the individuals' mental representation of the future. Future-oriented individuals like Patrick tend to be thrift, persevere and regulate behavior, establish goals and expectations, and motivate and monitor performance. They are driven and oriented towards future reward. This contrasts with a number of sub-Saharan African youths who prefer fulfilling the obligations of their social network. They display unexplained behaviors and feelings of determination, stability, money spending, and the enjoyment of life, thinking that the future will take care of itself. Infact there is a general tendency of trying to hide a disability in order to save face instead of dealing with this weakness. The biggest problem making the African youths not to achieve much might be their short-term-oriented nature. As demonstrated by Patrick, the youth career choices are a function of expected benefits in a

varyingly distant future, such as being able to access a desired occupation, earn an income, achieve independence, and improve one's competencies. This is consistent with the works of Patel et al. (2009) who found peer support to predict career decision-making self-efficacy, suggesting that peers might play a large role in the development of confidence in completing career-related tasks and growth mindset. Similarly, our discussions seem to suggest that the growth mindset is associated with career path. The planning exhibited by Patrick could be a result of reflexive templates/actions he held resulting from the people he interacted with as he developed from infancy to adulthood. Although empirical literature is sparse, the more the mother or the maid is educated depending on who spends more time with the child's transition to youthful stage, the more the youth will take on long-term orientation while the reverse is true. Short-term orientation tends to be associated with low education levels of children being socialized to exert lower effort. Mothers who are less educated tend to stay at home or go to gardens or markets where they are engaged in petty trade and socializing children into values that are associated with these conditions. This has significant implications for the parenting styles adopted.

## Reflective Entrepreneurial Framing and Actions

Patrick's story suggests a link between reflective entrepreneurial framing and actions and growth entrepreneurial mindsets. Reflection is "a process that entails endeavors to construct or reconstructexperience, problems, existing knowledge or insights" (Korthagen et al. 2001, p. 58). Patrick is a reflective youth who defined the energy challenge from practice, related it to the previous experience and tried to adjust his actions to the community needs (context). He experimented, tested, reflected on the experience, retested, and revised his hypotheses about reality and schemas or frames. The story suggests that the way the entrepreneurship concept and reality is presented to the youth audience determines the way the information is processed and the entrepreneurial perceptions constructed. According to personal construct psychology (Kelly 1955), frames are templates, organizing ideas or themes, structures, and abstractions that work to link together stories historically, building up a narrative over time and across one's life-changing situations. Entrepreneurial schemas or frames are developed in the minds of the youth during their life trajectory which make them concentrate, develop, and focus on achieving lifelong goals. The learning environment presents a learning context which influences the development of frames and schemas that permit new learning through making connections with what was previously determined to be valid under specific conditions and contexts. The schemas created by the learning environments are positively associated with learning engagement by more frequently interacting with trainers, engaging in diversity-related activities, and having classes that emphasize higher-order thinking skills. The youth tend to interpret what is going on around their world of careers through their natural and social framework. Whereas the natural frameworks identify events as physical occurrences taking literally and not attributing any social forces to the causation of events, social frameworks view events as socially driven occurrences, due to the whims, goals, and manipulations on the part of other social players (people). The ensuing discussion suggests that the youth with entrepreneurial growth mindset will show cognitive reflective frames and actions tuning to goal decision-relevant versus goal implementation–relevant information.

## Lessons Learnt

1. A combination of Vygotsky (1978) theory of the "zone of proximal development," the theory of personal construct psychology, and the career development theory explain Patrick's growth entrepreneurial mindset. The zone of proximal development provides the constructs of scaffolding, internalization, and learning environment which partially explain Patrick's growth mindset. These constructs are

augmented by Patrick's cognitive development, cognitive heuristics in decision-making, and the reflective entrepreneurial framing and actions. These are a result of the support given by trainers, mentors, and peers at Dezhou University. The reflective entrepreneurial framing and actions and cognitive heuristics constructs come from the theory of personal construct psychology while the goal-directed career decision-making self-efficacy comes from the career development theory. The concepts and/or constructs derived from the three theories are combined to form a model presented in Fig. 1. This model has implications for governments in sub-Saharan Africa, training institutions, parents, and youths. Scholars may wish to empirically test out the relationships in this model and interrogate the assumptions that underlie the arrows to verify whether this model is generalizable in Africa and other developing countries.

2. Unlike Patrick, the entrepreneurial mindset among the youth in sub-Saharan Africa is constituted either by "fixed mindset" (or entity theory) and the "growth mindset" (incremental theory). Patrick's case demonstrates the growth entrepreneurial mindset which determines how he construes and reacts to situations. Mindset possesses the supremacy to direct the attitudes of the youth and control their behavior and character. It has authoritative undertones when considering creativity, innovation, and resourcefulness. However, interventions can be undertaken to change the youth fixed mindset to enhance the development of the growth mindset so as to yield positive learning outcomes. These interventions are likely to reduces life dissatisfaction and enhance willpower, creativity, and well-being of the youth.
3. African governments need to rethink and improve the learning environment. The physical learning environment in sub-Saharan Africa is not conducive for learning, skill development, and transfer. For example, the physical learning environment in South Africa in 2017 had more than 11 million learners who received education in overcrowded classrooms (Matshipi et al. 2017). Many other countries in east, west, central, and northern Africa face similar physical learning challenges. The presence of overcrowded schools, colleges, and universities has attendant content delivery and evaluation problems which teachers experience when teaching. Teachers in overcrowded classes stick to "chalk and talk" instructional method delivering lessons with their backs pressed up against the blackboard making it impossible to use higher-order questioning and active learning approaches. The overcrowding is later offloaded to the industry which receive many undergraduates' students looking for internship training. There is little participation in learning activities. Disruptive behavior characterizes these classes. Students needs and weaknesses are difficult to address in large classes. Large classes are quite often characterized by very hot and noisy environment, demotivating learners to participate and making learners to feel tired. It is very hard to develop a social environment in large classes where knowledge from teachers, mentors, and peers is shared. As a result of large numbers and limited infrastructure and facilities, the youth end up learning knowledge outside of school locations in outdoor environments, informal settings including social groups, and social media among others, thereby affecting mindsets either positively or negatively. Infrastructure in training institutions need to be improved so that teaching focuses on encouraging risk taking, team-driven experimentation around real-life challenges that are relevant to the specific competencies and skills being developed. Such settings make students enjoy learning and take responsibility for their learning in an environment that resembles the realities of life after school (Ashari et al. 2019). In conclusion, learning environments have both a direct and indirect influence on mindset of student learning, including their engagement in what is being taught, their motivation to learn, and their sense of well-being, belonging, and personal safety.
4. Developing a youth growth mindset may require African governments, schools, colleges,

universities, and national councils of higher education and teachers to come together and promote goal-oriented career decision-making self-efficacy. The current career education and guidance offered by training institutions focusses on helping students with their academic achievement and not helping students plan and prepare for their future work roles. This requires the development of career decision-making skills of learners as compared to other possible skills. Individual learning inspiration and their achievement is affected by the mindset that students hold about their own abilities and intelligence (Paunesku 2013; Paunesku et al. 2015). Training institutions should help the youth to develop short-term and long-term career goals and the associated career decisions as they navigate through their academic and career trajectory. This is especially important because youth who have a growth mindset see challenges as a way to grow their abilities while those with a fixed mindset view challenges as a sign that lacks inborn ability.

5. The process in which African youth are assisted to achieve tasks through performance (scaffolding) may promote a growth entrepreneurial mindset. However, this may require training institutions revisiting a variety of instructional techniques, tools, strategies, and guides used to move students progressively toward stronger understanding and, ultimately, greater independence in the learning process. The tools may be used by parents, teachers, and peers to enable learners to reflect on their knowledge and demonstrate their competence independently. Scaffolding can be motivational or cognitive. With motivational scaffolding, trainers build rapport with students by demonstrating that they care. The trainers can encourage youth by praising their successes with positive feedback and verbal rewards. Cognitive scaffolding on the other hand occurs when trainers promote thinking of the youth. For example, trainers can present several alternatives to the youth for choosing. Demonstration relies on showing youth how to combine moves that they had already performed in new ways. One-to-one scaffolding may be encouraged where one trainer working one-on-one with one youth to dynamically assess the youth's current level provides just the right amount of support for the youth to perform and gain skill at the target task, and customizes the support as needed until the scaffolding can be entirely removed and the youth can take ownership. Peer scaffolding is another possible alternative where peers provide support, leveraging the strength in numbers of peers in classrooms (Sabet et al. 2013). This may also involve older youths providing scaffolding support to the younger youths.
6. Another lesson to be learnt in Patrick's case is that reflective entrepreneurship framing and actions promotes a growth entrepreneurial mindset. Infact, the decision to engage in any kind of behavior is greatly influenced by the youths' frames of a businessachievability and utility. Exposure to practice, information, resourceful, and helpful networks shape the youths' risk perception and ultimately on the decision to engage in business. This paper suggests that governments through their respective ministries for the youth and training institutions should promote reflection among the youth using metaphors, critical events, stories of successful youths, conceptual maps, and repertory grids. This could to be carried out in a cooperative endeavor that promotes reflexive dialogue. The way the youth structure the world (reality), the way in which they see themselves in that world, and the way in which they act in that world (Bannister and Fransella 1986) are associated with their mindsets.

# Entrepreneurship and Serendipity

Nicholas Dew
Naval Postgraduate School, Monterey, CA, USA

## Definitions

Serendipity: Events that happen by chance in a happy or beneficial way.
Sagacity: Having keen mental discernment and good judgment.
Murphy's Law: Anything that can go wrong will go wrong.

## Introduction

Traditional philosophical approaches to serendipity view it as a special kind of luck that is not influenceable. However, many entrepreneurs do not subscribe to this view of serendipity. These entrepreneurs believe serendipity to be open to influence IF effort is applied in the right ways. They want to know how they can get serendipity to happen for them, or happen for them more often. This entry catalogs the main levers available to entrepreneurs who want to improve the chances of something serendipitous happening for them, as well as explaining why philosophers and entrepreneurs diverge in their perspectives on serendipity. In the end we can put philosophy and entrepreneurship back together again by noticing that, while entrepreneurs vary widely in their characteristics, research shows there are also a few key characteristics they frequently share. Given these characteristics, it makes perfect sense that some entrepreneurs believe serendipity is something that they can influence because, by believing they can, they can.

The views and opinions expressed in this article are those of the author and do not necessarily reflect the official policy or position of any agency of the U.S. government or its institutions.

### Background

Serendipity is an ambiguous word of soaring popularity (Alcock 2010). It is typically taken to mean events that happen "by chance in a happy or beneficial way" (Oxford English Dictionary 2020). *The* classic example of serendipity in science is Flemming's discovery of penicillin and – partly because of widespread fascination with serendipity – literally hundreds of examples of serendipity in science are known today; some claim that up to half of all scientific discoveries have some serendipitous aspect. In one career development study, 60% of older adults said their career had been impacted at some point by serendipitous events (Betsworth and Hansen 1996). We prefer entrepreneurial examples – and there are also many – such as the founding of Metier Digital. Metier started after its founder, Nana Parry, had his passport confiscated at Casablanca Airport in Morocco in 2017 (Coleman 2019). He was led away by a passport control officer to a room where, a few minutes later, another man showed up in the same predicament. They started talking, their chance interaction led to another meeting in London a few months later, and boom! Metier Digital was born.

A classic philosophical account of Metier's founding would stress what the Oxford English Dictionary stresses: the chance element of this story. It would further highlight that Nana Perry was receptive to the possibilities emerging from the chance encounter at Casablanca Airport and prepared to move on them. As Louis Pasteur put it: chance *only* favors the prepared mind. The "only" is an important word in Pasteur's statement, one that is often omitted and, when it is omitted, significantly changes what Pasteur meant about serendipity.

However, there is an important distinction between the established philosophical account of serendipity (Merton and Barber 2004) and what entrepreneurs believe about serendipity or, at least, would like to believe about it. What entrepreneurs believe is something more akin to the idea that chance opportunities *vary* according to how receptive and prepared for the unexpected the entrepreneur is. Mostly the emphasis is shifted to variation in the two controllable elements – the nature of the quest and preparedness for what one

may meet – and away from the accent on chance. Hence, front and center in the entrepreneurial account of serendipity are the aspects of serendipity that entrepreneurs can do something about (Napier and Vuong 2013). For entrepreneurs the attraction of serendipity – what makes it so much more desirable than just pure luck – is precisely the fact that it is comprised of some influenceable elements. For while plain old luck may befall the lazy, serendipity also necessitates a prepared mind and an industrious pursuit (Denrell et al. 2003). Because these elements are to some extent manipulatable, entrepreneurs' thinking about serendipity naturally turns to questions about how they can get some – or more – of it to happen for them.

However, one of the things we hope to show in this entry is there is another very important factor at work as well: entrepreneurial beliefs about serendipity. Entrepreneurs are predisposed to higher optimism and openness than the general population and these predispositions alone make them more likely to perceive ambiguous events as lucky accidents. Hence one would expect them to be more at risk of experiencing serendipity. In which case serendipity may be just the right concept for entrepreneurs partly because their predispositions about it are central to shaping their experiences of it.

In the following pages we will explain what we know from research about the two main levers available to entrepreneurs who want to improve the chances of something serendipitous happening for them. Later we will shift to explaining beliefs about serendipity based on predispositions toward optimism and openness. It is largely the psychology of serendipity that explains why entrepreneurs' beliefs about serendipity diverge from the time-tested way philosophers talk about it. Before getting to those things, let us start by looking at the traditional philosophical approach to serendipity and the two levers every entrepreneur can pull in order to improve their chances of being subject to serendipity.

## Philosophical Perspectives on Serendipity: The Two Levers

The modern use of serendipity can be traced to eighteenth-century England, and in turn to an earlier book recounting the adventures of *The Three Princes of Serendip*, published in Venice in 1557 (Campa 2008). The three princes, "were always making discoveries, by accident and sagacity, of things which they were not in quest of" (Walpole 1754). There are three vital ideas here. First, the princes are already on a quest for something. Second, unexpected, accidental things happen on the journey. And third, they have the sagacity to make discoveries. This last element – sagacity – is the least well-known; it adds a touch of perceptiveness and insightfulness to the mix.

While there is a weak usage of the term serendipity in which it tends to be equated with plain luck, the more precise meaning of the term involves a tight arrangement in which the quest, the unexpected accident and sagacity *intersect* (Dew 2009; Merton and Barber 2004). In the rest of this chapter we will use serendipity in this more precise sense since fidelity to the original idea is useful in order to understand how it might be possible for some entrepreneurs to become subject to more serendipity than others. Nonetheless, it is important to bear in mind that the three elements cannot be separated and that the concept of serendipity depends on all of them being present, even though unexpected accidents tend to anchor the idea in our minds.

The first element of serendipity is that it occurs during a *quest* one is already undertaking. This is one reason the term has leaned itself so well to scientific discoveries, which often result from some kind of deviation from the path a scientist was already taking in a quest for something different. Hence scientists find things they were searching for – and things they were not searching for – on the same journey. The analogy in entrepreneurship is exploring for, or working on creating, a product only to unexpectedly find or develop something quite different. For example, the lean start-up method (Reis 2011) involves a search for information that signals the entrepreneur's idea may work, where the barriers to implementation are, what the market reception is likely to be, and what price points make sense. All these are examples of a deliberate search process that nonetheless may get re-routed by an unexpected accident along the way. Some accounts of

serendipity tend to skip over this element of the phenomenon, in some cases putting emphasis on the effort the entrepreneur must undertake to exploit a serendipitous event. Nevertheless, in a moment we will see that the effort the entrepreneur puts into the quest and how the quest is undertaken are both important for manipulating one's chances of something serendipitous happening.

The second element of serendipity is *sagacity*, or what Pasteur referred to as having a "prepared mind." The important point here is that perceptiveness and insight tend to derive from already having certain kinds of information and knowledge to hand. These are required in order to recognize what you have accidentally stumbled upon (Shane 2000; Kirzner 1997). Put another way, one needs to have the capacity to absorb the implications of the accidental, when it happens (Cohen and Levinthal 1990). When Fleming famously discovered penicillin he was already known as a brilliant researcher who knew a lot about bacteria. Hence, to reiterate, Pasteur pointed out that chance *only* favors the prepared mind, which is to say a mind that already comes equipped to know that one is seeing something. Some accounts of serendipity relax this element somewhat to incorporate the idea that having an open, curious, alert mind contributes to sagacity, which suggests something more than specific information and knowledge may be involved. We shall see later that openness may indeed have a role in serendipity, for this and other reasons.

The third element of serendipity is unexpected accidents, usually of the fortunate kind, although even Murphy's Law may eventually yield good fortunate on occasion. To be by their nature unexpected these events tend to be longshots, that is, unlikely in a probabilistic sense. They also tend to be things that easily might have happened differently, a property known as modal luck.

Practicing entrepreneurs will probably agree that unexpected events are an inevitable aspect of their endeavors, and potentially a desirable aspect of them. However, they might be excused for not initially recognizing this philosophical view of serendipity since it adds elements that make serendipity more complicated than just a lucky accident. However, this framework yields something important: both the quest and sagacity are influenceable. Each element is subject to entrepreneur manipulation – thus representing a lever that can be pulled – to rest some control away from lady luck, in favor of putting it into the hands of entrepreneurs. In the next two sections we will take a peek at what pulling these levers looks like.

### The Quest: Increasing Search Efforts

Probably the most straightforward way for entrepreneurs to potentially influence serendipity is to – metaphorically – go on more quests. It may seem trite to point out, but it remains a fact that if you are not going anywhere or doing anything, you are not likely to find something unexpected in the process (Drucker 1985). Assuming accidents are random, entrepreneurs who are proactive, who put more effort and resources into deliberate search and exploration, are likely to have more unexpected (lucky) accidents along the way. These activities are analogs to the three princes going on more adventures. In general, entrepreneurs' optimism, openness, and "can-do" attitude (which researchers refer to as self-efficacy) all support investing more in meeting people and doing things.

Past research has identified three themes in going on a quest that may make a difference in the occurrence of serendipity. The first is about people and networks. There are a good number of sources that identify conferences, incubators, open offices, new customers, new employees etc. as triggers for serendipity. For example, 3 M is famous for the serendipitous development of Post-It Notes. The company says:

> Innovation has thrived at 3M because people talk. They strike up lively conversations in hallways, cafeterias and labs. They talk across departments and divisions. They meet to share ideas in brainstorming sessions and forums. While more traditional organizations have kept researchers and engineers within their own areas or divisions, where their loyalties were strongest, 3M has instead fostered a strong sense of attachment to the company as a whole. (3M, 2002, p. 33; quoted in Garud et al. 2018).

Fundamentally, this is about exposure to variety, to which the unexpected is assumed to be

correlated. Talking to people you do not already know about things you are not completely familiar with may be more likely to reveal new information and ideas than talking to people you do already know (Granovetter 1973). This increase in variety in people and places therefore brings with it an increased potential for lucky, unexpected, things (Wiseman 2004).

A second theme from research is the proactive search for variance – and with it the unexpected – by fooling around. The late Jim March (1982), who had a gift for juxtaposing ideas, referred to the benefits of what he called the "technology of foolishness." Entrepreneurs may be more likely to discover unlikely things by sometimes deliberately fooling around. For example, in a study about accidental innovation, Austin et al. (2012) found that designers do things to deliberately inject randomness into the design process. In one memorable example, a pottery artist in their study would form beautiful clay pots and then whack them with a piece of one-by-two while they were still soft. By causing an accident, the artist would sometimes discover something unexpectedly good. The general principle at work here is anytime entrepreneurs go to the effort of putting themselves squarely in the path of variability they are increasing the likelihood that they may be subject to something unexpected. The more technology of foolishness they employ, the more likely they are to set up connect-the-dots moments (Busch 2020).

A third theme from research involves going on journeys that everyone else has not already been on. This is a difficult principle to carry out since it is difficult to know what (metaphorical) journeys others have already executed. However, the general idea is that some paths have already been traveled a lot, and everything unexpected that can happen has already happened on them, and therefore it makes sense to explore some less well-traveled routes (Denrell et al. 2003). Practically speaking, this probably means that entrepreneurs should let what is idiosyncratic about themselves – who they are, what they know, and who they know (Sarasvathy 2009) – orient their search activities. This may increase the chance that they accidentally discover something that others have not already discovered.

### Sagacity: Improving the Prepared Mind

The other influenceable aspect of serendipity is sagacity, which means having keen mental discernment and good judgment (Oxford English Dictionary 2020). Louis Pasteur's point was that to reap benefits from a lucky event means having a mind that is *already prepared* to be discerning and use good judgment when a potentially serendipitous moment strikes. Fundamentally, improving the prepared mind means learning of several different kinds. We can break down the learning challenges into two major categories.

First, a stock of information and knowledge is necessary to develop good judgment and discernment (Ronstadt 1988; Venkataraman 1997). Expert knowledge of bacteria was Fleming's edge in discerning what the contents of a petri dish really meant. In the economics profession this a human capital investment issue, and that Fleming's discovery was a product of his investments in human capital. Being sagacious necessitates investing more in accumulating a stock of information and knowledge that might prove valuable when the unexpected happens. But what kinds of investments? A distinction is frequently made between specialization, which involves deepening one's pool of information and knowledge, and generalization, which instead involves cultivating a broader base. Each direction has its merits. The late economist Eddie Lazear was one champion of the popular view that entrepreneurs are successful when they are a jack-of-all-trades and there is some evidence that this is indeed the case (Lazear 2004; Åstebro and Thompson 2011). The skill of the generalist is in being able to connect-the-dots across different domains, therefore having the good judgment to see how an unexpected event may be connected to other things (Epstein 2019). The specialist has deep knowledge about a particular domain, which makes them more likely to see the deeper patterns in the unexpected, its connections to profound issues in the domain, and to judge these connections very rapidly (Klein 2011). In part, the importance of these different knowledge bases lies in the assorted ways that they direct attention and shape what information entrepreneurs experience as relevant in any given, unexpected incident (McMullen and Shepherd 2006).

Second, there is also an attitudinal and process component to discerning and judging. An entrepreneur's skills in these areas may be improved by a heightened focus on the relevant attitudes and learning about processes that simulate or enhance discerning and judging. For example, there is a long history in entrepreneurship of emphasizing the role that alertness plays in the entrepreneur's skillset (Kirzner 1973; Gaglio and Katz 2001). In part alertness is supported by having a curious attitude about events and people, which may be grounded in openness to new information and experiences. Recent research by Phil Tetlock on the attitudes and skills involved in good forecasting provide a potential roadmap for thinking further about these issues (Tetlock and Gardner 2016). Forecasting is a difficult problem that requires highly refined judgment capabilities. Tetlock found that good forecasters are more intelligent and open than average. They are alert, gathering as much information as they can find from lots of different sources. They are curious and often shifted mental gears. However, Tetlock found their most important characteristic was their commitment to self-improvement. What good forecasters shared was their willingness to see when they were doing poorly and adjust. They were self-critical and changed their minds often based on feedback. With these findings Tetlock's study provides some of the best pointers we have to learnable processes that may enhance effective discerning and judging in real-world settings. This pulls back the curtain on some of the processes that support improvements in sagacity and with it the odds that an entrepreneur might be subject to serendipity.

## Two Factors Shaping Entrepreneur Perceptions of Chance Events

In the previous two sections we have seen that the incidence of serendipity may be influenced by increased effort (by going on more quests) and skill improvements (sharpening the prepared mind in particular ways). But what of entrepreneur attitudes about chance itself? Might these also play a role in the extent to which entrepreneurs experience serendipity?

Research on psychology holds the keys to unlocking the answer to this question. To complete our picture about what entrepreneurs believe about serendipity we need know how they perceive chance events in the first place. Indeed, from a psychological perspective serendipity is fundamentally influenced by subjective perceptions about chance.

In this section we will endeavor to shed some light on this issue by pulling together research from two different domains that together may help provide some insights. The first domain covers some common characteristics of entrepreneurs; researchers who study entrepreneurship have amassed evidence about these characteristics. The second domain is what we know about how some individual characteristics are related to perceptions of luck among the general population. When these two bodies of evidence are put together, we can reasonably speculate that entrepreneurs are likely to be believers in serendipity because of their predispositions. It is important to note that, without systematic research that specifically studies entrepreneurs, we cannot expect a conclusive answer. But the results of research that have already accumulated are certainly suggestive.

Starting with the entrepreneurs, while entrepreneurs differ enormously on just about every human dimension, many studies show that they also share a few important commonalties. The list here is small, but two crisp findings are that entrepreneurs tend to be predisposed to higher levels of optimism and openness than the general population. Not incidentally, both these characteristics are positively connected with personal well-being. Yet less noticed is that they are also connected with general perceptions of luck (of which serendipity is a particular case).

### Optimism

Studies show that entrepreneurs are more optimistic than average; in some they are off-the-charts optimists (Hmieleski and Baron 2009). Healthcare studies typically argue that there is an appropriate level of optimism bias, since optimism tends to correlate with healthy human

functioning, that is, with psychological health and overall well-being. Earlier we noted that higher optimism may motivate entrepreneurs to put more effort into search activities, which is already one point of leverage in increasing the likelihood of being subject to serendipity.

How else might optimism be related to serendipity? When we look at studies of the general population, we find that optimism is related to perceptions of luck, that is, more optimistic people perceive chance events that happen to them in a positive light (Hales and Johnson 2018). While this research does not pinpoint serendipity in particular, it would certainly be one example of the kinds of chance events studied. To illustrate, one study presented subjects with a variety of ambiguous events and found that more optimistic subjects were more likely to interpret the events as being lucky, whereas more pessimistic subjects were more likely to interpret the same events as unlucky. For example, optimists tend to interpret a near-miss (e.g., narrowly avoiding an accident) as lucky ("Phew, I'm so lucky I survived that"), whereas pessimists interpret the same event as unlucky ("Bad things always happening to me; I could have been killed") (Darke and Freedman 1997a).

Another study supported these results by finding that global self-assessments of optimism correlated strongly with luck beliefs (Maltby et al. 2008). In general, optimists tend to perceive chance events as breaking in their favor; they *expect* good things to happen to them (Day and Maltby 2005). Since entrepreneurs tend to be more optimistic than people in general, we can reasonably speculate that they are more at risk of perceiving events as serendipitous, that is, when chance events occur, they tend to "see" them in a positive light.

### Openness

Openness is a core personality trait. In the five-factor model of personality, openness to experience is the extent to which someone expresses an interest in new ideas, perspectives, and circumstances. We know from many studies that entrepreneurs tend to be more open than the general population (Zhao and Seibert 2006). As we have already discussed, openness is clearly related the sagacity aspect of serendipity, that is, having a prepared mind and using it.

But studies indicate that openness is also systematically related to the extent to which individuals believe themselves to be lucky people (Maltby et al. 2008). The fact that individuals view people, rather than events, as lucky is one of the key findings from research on beliefs about good luck (Pritchard and Smith 2004). Individuals have highly stable beliefs about luck (Jiang et al. 2009), with most viewing themselves to some degree as "lucky people who are favored by consistent good luck" while a smaller number of people view luck as random, and a very few consider themselves consistently unlucky (Darke and Freedman 1997b). In one study of blackjack players almost 80% of those interviewed viewed luck as a concept that refers to a person rather than events (Keren and Wagenaar 1985).

So, while we have no studies that directly examine entrepreneur beliefs about luck, we can put two and two together: openness is related to perceptions of good luck in the general population, and entrepreneurs are higher on openness than average; therefore we can reasonably speculate that entrepreneurs are, on average, likely to view themselves as lucky people. As with optimism, this puts them more at risk of perceiving chance events as serendipitous, that is, they are predisposed to view ambiguous events as happy accidents.

We may be able to extend this shortlist of serendipity-related entrepreneur characteristics to include other factors: for example, entrepreneurs' can-do attitudes (self-efficacy) are very likely implicated in their perceptions of serendipity as well (Chen et al. 1998; Zhao et al. 2005). However, this would take us into an even more complex analysis of the antecedents of serendipity, more than is necessary for our purposes here. Entrepreneur predispositions toward optimism and openness are enough to make the general point, which is that entrepreneurial beliefs about serendipity may be partly based on global perceptions of themselves as lucky people to which

fortunate accidents happen. They are more likely to perceive an event as a fortunate accident because of their higher optimism and openness, and therefore more likely to perceive that something serendipitous happened to them. This is less about whether chance events happen – things are happening all the time and ambiguous events may be randomly distributed among entrepreneurs. It is more about how entrepreneurs view events when they happen. At the same time, we have already seen that entrepreneurs' beliefs about serendipity are also based partly on their convictions that they can control the effort and skill they apply in order to yield more potentially lucky events and do more with them when they happen. This combination is potent.

In sum, for entrepreneurs serendipity is less a narrative about pure chance, and more one about perception and control. It is a combination of being a lucky person (where luck is in the eye of the beholder) combined with the application of effort and skill (that are infinitely controllable). This turns serendipity from a phenomenon centered on chance into something that many entrepreneurs believe to be an influenceable – and therefore not-altogether-chancy – phenomenon in a universe of unexpectedness.

## Conclusion: Living with a Tension

Entrepreneurs' everyday reality is their beliefs about serendipity rather than the philosophical niceties of the topic. In this entry we have seen that those beliefs – encapsulated in the adage that, "The harder I work, the luckier I seem to get" – probably do have some truth to them. Effort and preparation probably do influence the occurrence of serendipity in an entrepreneur's career. The predispositions of entrepreneurs likely also make a difference by shaping the way entrepreneurs perceive chance events, and therefore the likelihood of serendipity being recognized. Addressing luck more generally, Stephen Brown (2005, p. 1231) sums-up this style of thinking as follows:

> Richard Wiseman's (2004) experimental studies of "lucky" and "unlucky" individuals – and, interestingly, organisations – reveal that there is an element of self-fulfilment about good fortune. Good luck reproduces itself, bad luck is bedevilled by inbreeding. *Those who believe they are lucky and act on that belief frequently find that their luck increases*, whereas those who consider themselves unlucky and assume that the worst is going to happen, often find that it does (Kanter, 2004). Accordingly, Wiseman (2004) encourages his clients to expect good fortune, exploit the luck factor and "learn to be lucky." (Brown 2005, p. 1231, italics added)

Such accounts add to our collective sense that a narrative positing serendipity as being a somewhat shapeable phenomenon is justified (Busch 2020). If so, then entrepreneurs largely have had things right by believing different things about serendipity than philosophical accounts have traditionally emphasized. In this entry we have seen that it is not difficult to understand why these entrepreneurial beliefs exist, and why they make sense to entrepreneurs.

More than just making sense, serendipity is simply a more *desirable* idea than luck. Some of this may be thought of as being a matter of taste: serendipity is not as clumsy and random as "mere" luck. But by being open to skill and effort – as well as chance – serendipity is infinitely more expedient to entrepreneurs than luck. For while there is no credit to take for pure luck, one can take at least some credit for serendipity. Fundamentally serendipity is perceived as being more controllable, and therefore more motivating, than pure luck. People strongly prefer having some control over things, and serendipity grants at least some of that to those who believe in shepherding it. Hence for motivational reasons it makes perfect sense for entrepreneurs to prefer the blessings of serendipity over those of random luck. In sum, a central difference between entrepreneurial and philosophical perspectives on serendipity is that the former takes account of the psychological issues of perceived control and motivation that are irrelevant to traditional philosophical accounts of the phenomenon.

Is this departing too much from the traditional meaning of serendipity? Once the three elements of serendipity have been rendered subjective and manipulatable hasn't the meaning of serendipity been undone? In the traditional philosophical account of serendipity each of the three elements

are objectively discernable and fixed at the moment when serendipity strikes: the protagonist is on a given journey somewhere, with a given knowledge set (the "prepared mind" is populated with specific things), when a patently objective accident happens. One is *lucky* to have been on a specific, relevant journey instead of any one of infinite possible others; *doubly lucky* to have inherited from one's ancestors the predisposition to perceive a potential for good fortune in whatever fluke the journey might bring forth; and *triple lucky* to possess a mind ideally prepared with the exact information and knowledge needed to recognize the opportunity in the chance occurrence (Fleming, of course, is the example par excellence). Thus, in the traditional narrative everything depends on chance; there is nothing individuals do to shape the occurrence of serendipity. There is no control or choice in the matter, it happens to you. Luck wraps around everything.

The tension between the philosophical and entrepreneurial accounts is clear enough. Moreover, the dictionary definition and intuitive meaning of serendipity both align with the philosophical approach by putting chance in the center of the topic. We may gain a neat talking point by casting serendipity as a matter of "planned luck" (Busch and Barkema 2020) but we also buy ourselves some troubles addressing the extent to which we are still describing serendipity. Hence the pragmatic entrepreneurial belief that serendipity is somewhat shapable lives in tension with the equally pragmatic expectation that the essence of the idea remains it being a highly chancy spectacle. Notions floated by academics about the possibility of planning for, and routinely harvesting, serendipity using serendipity capabilities (De Rond 2014; Napier and Hoang Vuong 2013) raise suspicions about whether they are still talking about the same idea. Push the shaping and harvesting narrative too far and we may end up with an oxymoron.

In conclusion, careful readers will have already noticed that throughout this entry we have emphasized entrepreneurs may be able to increase their odds of being *subject* to serendipity but eschewed the notion that they can somehow *make* serendipity happen. This distinction is important. There is a big difference between believing that entrepreneurs may have some ad hoc influence over their odds of having an unexpected accident and believing that a planned and programmatic approach to harvesting serendipity is justified (Winter 2003). However, at least we have seen in this entry that the philosophical and entrepreneurial views of serendipity can exist in harmony with one another if we get the framework of analysis right. Entrepreneurial beliefs about having a hand in laying the groundwork and setting the conditions that bring serendipity to their door reflect entrepreneurs increasing their efforts towards search and preparedness, as well as being predisposed toward favorable perceptions of chance events. By understanding the variability in these three elements we enrich the concept of serendipity and better appreciate why serendipity may ultimately turn out to be a more powerful and popular concept in entrepreneurial circles than pure luck. And we can reconcile the philosophical approach that dominates explanations of serendipity in scientific discovery with entrepreneurial beliefs about serendipity as something they may be able to influence. Because, by believing they can, they can.

# Environmental Challenges to Public Procurement

Christy De Friest Smith
Henry C. Lee College of Criminal Justice and Forensic Sciences, University of New Haven, West Haven, CT, USA

## Synonyms

Environmental procurement; Organizational environment; Sustainable procurement

Procurement is a critical component of public organizations, facilitating the acquisition of goods and services that are imperative for organizational operations and success. The procurement process is typically comprised of many steps that at a minimum include conducting a needs assessment, researching alternatives, providing a bidding process, evaluating and scoring bids, awarding a contract, and ultimately evaluating performance. While the process itself is straightforward, there are many challenges to effective and efficient public procurement. Some of these challenges are related to the organizational environment, while others are attributable to the natural environment. The challenges relevant to both the organizational and natural environments will be discussed herein.

## The Organizational Environment

Challenges inherent in the organizational environment are many and can vary according to factors such as size and structure, professionalism, and organizational investment in technology. Within each of these categories, there are aspects that can either enhance or hinder the procurement functions of the organization.

### Size and Structure

Organizational size warrants consideration because the procurement difficulties experienced by smaller organizations are typically very different from those suffered by larger organizations. For example, larger organizations can take advantage of economies of scale in their acquisition of goods while smaller organizations are typically unable to take advantage of the preferred pricing reserved for large-volume sales. While smaller organizations can combine their purchasing power with similar sized organizations in order to access this reduced pricing, this option is not always available and relies on other factors such as mutual need and timing. Large organizations, alternatively, have challenges related to managing the purchasing functions for multiple and often varied departments and/or units. For perspective, consider the procurement activities of a mid-sized city with those of the Department of Defense: both organizations will procure similar goods in terms of equipment for staff, but the Department of Defense must coordinate the purchase of these goods for a much larger workforce that may be geographically dispersed. This leads to the role of structure in either enhancing procurement activities or hindering them.

The aspect of structure that can present a particular challenge to procurement is the extent to which purchasing functions are centralized or decentralized. Cities have used centralized purchasing since the 1900s (Thai 2001) and have benefited from tight controls that guide procurement decisions, reduce risks, and achieve efficiency in routine procurements (Schapper et al. 2006). However, this rigidity and lack of flexibility can be less effective for large organizations with diverse locations or functions that require a level of autonomy. A decentralized structure can facilitate innovation and creativity, but transparency and accountability may be reduced. One approach to address these challenges is to centralize some of the functions and allow greater flexibility when and where warranted, but it is clear that size and structure can complicate procurement activities.

### Professionalism

Another challenge of the organizational environment is the disparity in how public procurement is perceived. Arguably, public procurement may or may not be viewed as a profession, which in turn

can limit the role that purchasing is able to play in a public organization. Organizations recognizing procurement as a profession likely also embrace procurement as a strategic tool for achieving organizational goals. One reason for the lack of consensus about public procurement as a profession is because certification is not a standard requirement for public procurement professionals. Prier et al. (2010) suggest that requiring certification could be an effective barrier-to-entry that could elevate public procurement to the status of a profession.

While certification is not a panacea for preventing inappropriate or bad procurements, it can provide a minimum standard of ethical and practical training for public procurement professionals. A complication, however, is that there is no single certification or certifying body; national organizations such as the Universal Public Purchasing Certification Council (UPPCC), the National Institute of Governmental Purchasing (NIGP), the National Association of Purchasing Management (NAPM), and the National Contract Management Association (NCMA) all offer varying certification programs (Callender and Matthews 2000), so there is no single, commonly accepted certification. This challenge related to professionalism may seem trivial, but it can directly impact the next challenge of the organizational environment: organizational investment in procurement technology.

### Technology

The final challenge of the organizational environment to be mentioned is that of technology, which can greatly enhance public procurement activities. It is increasingly important that purchasing offices adopt technology that will not only ease their processes but create efficiencies and cost savings. P-cards and e-procurement systems are two technological innovations that are designed to promote timeliness and efficiency in the purchasing process, and one factor influencing a public organization's adoption of such technologies is professionalism (Klay et al. 2010). Organizations that do not view purchasing personnel as professionals are less likely to invest in costly technology, such as e-procurement systems, or assume the risks that are associated with p-cards. By not investing in procurement technology, public organizations may also be missing out on opportunities to identify or prevent fraudulent activity.

## The Natural Environment

Similar to the organizational environment, the natural environment creates challenges to the public procurement activities of organizations. Environmental challenges include negative environmental impacts over the life of traditional products, price, and quality concerns of environmentally preferable alternatives, and stakeholder commitment to environmentally preferable purchasing. Further complicating the situation is the differences in definition of what sustainability means, how it can be achieved, and how it can be measured. Likewise, a great deal of time and effort is required to educate procurement personnel as to how to evaluate and compare traditional and environmental products or why it is even necessary to do so. While many public organizations have been exploring environmentally friendly purchasing practices and mechanisms for reducing the negative impacts of consumption, these challenges persist and must be addressed in order to successfully implement and maintain a sustainable and environmentally conscience procurement system.

### Product Life Cycle Costs

Public awareness of the negative environmental impacts of consumption is forcing public and private organizations alike to contemplate environmental consequences in the manufacture, use, and disposal of products. Traditionally, economic factors alone were used to make purchasing decisions; however, noneconomic factors are becoming more common in the evaluation and selection of goods (Drumwright 1994) and procurement professionals are considering the environmental costs during the extraction of raw materials, manufacture of goods, and disposal of that good (Emmett and Wright 2011). Life cycle analysis factors in the financial and environmental costs of producing a good, including energy consumption, water consumption, and final disposal of the

product. Calculating the total cost of a traditional, or brown, product is challenging in terms of time and availability of information, but this "full picture" perspective is desirable to the public and has become common practice if not best practice. Because traditional manufacturing processes score poorly on these environmentally conscious criteria, the challenge now becomes finding suitable alternatives with minimal environmental degradation over the course of the product's life cycle.

### Cost and Quality of Green Alternatives

While the desire to procure environmentally preferable, or green, products has grown, the actual practice of procuring green products or adopting green procurement policies is lagging (Smith and Terman 2016; Prier et al. 2016). Green procurement is defined as "selecting products or services that have a lesser or reduced effect on human health and the environment when compared with competing products or services that serve the same purpose" (EPA 2000); the National Association of State Procurement Officers (NASPO) defines green procurement similarly as "purchasing a product that has a lesser or reduced negative effect **or increased positive effect** on human health and the environment when compared with competing products that serve the same purpose" (NASPO 2016). Two of the most common reasons for this disconnect between the intent to buy green and actually buying green are the cost of green alternatives and the perceived quality of these environmentally preferable products. Green products are still perceived to cost more (Shen et al. 2017), and the benefits of engaging in green procurement are difficult to quantify because they are largely intangible and not easily translated to stakeholders: similar to crimes that are prevented, it can be difficult to measure environmental degradation avoided. This makes a higher priced green product more difficult to justify to an organization with scarce resources.

Another obstacle to institutionalizing green procurement practices is the perceived quality issue of green products. Many organizations ventured into green procurement through janitorial supplies and contracts, and many of the original green cleaning products did not perform as well as traditional bleach products or those containing similar harsh chemicals. There were also fewer green alternatives from which to choose, so many organizations continued to use the traditional products that performed well but harmed the environment. Another issue with green products was the "greenwashing" of the labels, where products were falsely labeled as green products when they were actually brown products that were just priced higher to capitalize on the green label. While there are now more high-performing green alternatives than there have ever been, the market power of governments has not yet been harnessed and directed at spurring the development of more and better green products at brown product prices.

### Stakeholder Commitment to Sustainable Procurement

Because of these cost and quality challenges, many procurement offices have been unable to fully commit to a green procurement policy or sustainable procurement program. These programs were found to range from mandatory requirements to buy green regardless of cost to milder suggestions and flexible guidelines to buy green products "when possible" or "when not cost prohibitive" (Smith and Terman 2016). In order to adopt a meaningful sustainable procurement policy, stakeholders at all levels have to prioritize sustainability and agree to the costs this entails. A commitment of this magnitude goes beyond financial costs to potentially include political costs for leaders who have not been effective in garnering support for a likely expensive endeavor with no short-term pay-off.

However, some public organizations have been successful in establishing sustainability offices with strict protocols and requirements for environmentally preferable purchasing programs. Factors that may facilitate this commitment to green public procurement include personnel with policy expertise in sustainability, membership in climate networks, and the presence of advocacy groups (Terman and Smith 2018); additionally, there may be a relationship between sustainable procurement practices and various facets of leadership as well as stakeholder expectations (Roman 2017).

## Conclusion

Public procurement is subject to challenges within the organizational environment as well as in the natural environment. Additionally, the organizational challenges can exacerbate those of the natural environment: the challenges of small organizations can make the obstacles to green procurement even more arduous to overcome. Despite the many challenges of adopting and implementing environmentally preferable purchasing strategies or policies, individual procurement professionals can have a positive impact on introducing and institutionalizing green purchasing practices. This can be achieved through embracing the standards and best practices of public purchasing organizations like NIGP and NASPO.

# Environmental Governance

Mahfuzul Haque
Department of Development Studies, University of Dhaka, Dhaka, Bangladesh

## Synonyms

**Environmental**: Conservational; Ecofriendly; Ecological; Green
**Environmental Governance**: Management of the environment
**Governance**: Ascendency; Authority; Control; Domination; Power; Supremacy

## Definition

Environment: Environment includes water, air, soil, and physical properties and the interrelationship which exists among and between them and human beings, other living creatures, plants, and microorganism. Environment is the sum of all external conditions affecting the life, development, and survival of an organism (any form of animal or plant).

Environmental Governance: Environmental governance comprises of rules, practices, policies, and institutions that shape how humans interact with the environment. It is a process that links and harmonizes policies, institutions, procedures,

tools, and information to allow participants (public and private sector, NGOs, local communities) to manage conflicts, seek points of consensus, make fundamental decisions, and be accountable for their actions.

## Introduction

Governing the planet's rich and diverse natural resources is an increasingly complex challenge. In our globalized world of interconnected nations, economies, and people, managing environmental threats, particularly those that cross political borders such as air pollution and biodiversity loss, will require new global, regional, national, and local responses involving a wide range of stakeholders. Effective environmental governance at all levels is critical for finding solutions to these challenges. Environmental governance therefore comprises rules, practices, policies, and institutions that shape how humans interact with the environment.

Environmental governance has been defined in several ways. Environmental governance is the whole range of rules, practices, and institutions related to management of the environment in its different forms (conservation, protection, exploitation of natural resources, etc.). All the processes and institutions, both formal and informal, that encompass the standards, values, behavior, and organizing mechanisms used by citizens, organizations, and social movements as well as the different interest groups are part of environmental governance in terms of accessing and using natural resources. Good environmental governance takes into account the role of all actors that impact the environment.

From governments to NGOs, the private sector, and civil society, cooperation is critical to achieving effective governance that can help us move towards a more sustainable future. Environmental governance is the concept in political ecology and environmental policy which advocates sustainable development as the highest consideration for managing human activities. It assumes a desirable future state for human societies in which living conditions and resources meet human needs without undermining the sustainability of natural systems and the environment, so that future generations may also meet their needs. It boils down to the concept of "Sustainable Development."

## Global Environmental Governance

At the international level, global environmental governance is the sum of organizations, policy instruments, financing mechanisms, rules, procedures, and norms that regulate the processes of global environmental protection. United Nations Conference on the Human Environment (UNCHE) held at Stockholm, Sweden, in 1972 was a watershed in the emergence of sustainable development. It adopted Action Plan on Human Development, which looked at the term "pollution of poverty" meaning environmental concerns of the poor, such as lack of clean water or sanitation. The major institutional decision coming out of the United Nations Conference on the Human Environment held at Stockholm in 1972 was the establishment of the United Nations Environment Program (UNEP), which was created to play the lead role in global environmental governance (GEG) by coordinating environmental activities within the UN agencies and acting as a catalyst for new initiatives. Since then, the world has seen hectic activity in global environmental policy (and, more recently, in sustainable development policy) and a host of treaties, organizations, and mechanisms have emerged. Global environmental governance is understood as the sum of organizations, policy instruments, financing mechanisms, rules, procedures, and norms that regulates the processes of global environmental protection. Since environmental issues entered the international agenda in the early 1970s, global environment today reflects both the successes and failures of this development. There is great awareness of environmental threats, and numerous efforts have emerged to address them globally. At the same time – and partly because of the rather spectacular growth in awareness and initiatives – the GEG system has outgrown its original design and intent. The system's high maintenance needs, its internal redundancies, and its inherent inefficiencies have

combined to have the perverse effect of distracting from the most important GEG goal of all-improved environmental performance. Even though the GEG system has achieved much in the way of new treaties, more money and a more participatory and active system than anyone might have imagined three decades ago, environmental degradation continues. Indeed, because we know so much more about environmental conditions and environmental processes, we also know more about what is not going well with the global environment.

### UN Development Decades

A series of UN Development Decades were undertaken by the United Nations in the 1960s, 1970s, 1980s, and 1990s in order to raise awareness among the global community targeting development. The First UN Development Decade in the 1960s prioritized economic growth and application of modern scientific and technical knowledge as route to prosperity in the underdeveloped world and development was expected to be "More like the West." The Second UN Development Decade in 1970s followed the previous policy. Development was not shared equally among the populations of these nations. It was thought underdevelopment was the direct outcome of development elsewhere. In 1980s, the Third UN Development Decade criticized overemphasizing of the economic dimensions of development. Development needed to be sustainable. "Development" in contrast was seen as a multidimensional. It was expected that development should encompass not only economic and social activities but also development of the habitat and the environment. The Fourth UN Development Decade in the 1990s aimed at developing a process that is responsive to social needs, sought a significant reduction in extreme poverty, promoted the development and utilization of human resources and skills. It put emphasis on economic growth in the developing countries, especially in the LDCs. UN Development Decades set the tone of a holistic development addressing all six aspects of a multidisciplinary development: economic, social, ecological, political, cultural, and spiritual.

### Sustainable Development

The Brundtland Commission, in its report, *Our Common Future* 1987, warned of the growing threat to Earth from pervasive world of poverty, environmental degradation, diseases, and pollution. The Commission led by Gro Harlem Brundtland, the then Prime Minister of Norway, defined "sustainable development" as the "development that meets the needs of the present without compromising the ability of future generations to meet their own needs" (WCED 1987). It contains with two key concepts: a) the concept of "needs" in particular the essential needs of the world's poor, to which overriding priority should be given; and b) the idea of limitations imposed by the state of technology and social organization on the environment's ability to meet present and future needs (Haque 2013). At a minimum, sustainable development must not endanger the natural systems that support life on the Earth: the atmosphere, the waters, the soils, and living beings.

Development needed to be sustainable. It must encompass not only economic and social activities but also those related to population, the use of natural resources, and the resulting impacts on the environment. Resources are thought to be infinite, in fact they are not. Pollution and environmental degradation are considered the inevitable consequences of industrial development. Development and conservation are incompatible; challenges are how to develop minimizing adverse impacts on the environment (Asefa 2005). The idea of sustainable development represents an attempt to link economic growth to wider ecological and social issues. "The reconciliation of society's developmental goals with the planet's environmental limits over the long term is the foundation of an idea known as sustainable development" (US National Research Council 1999). FAO's code of responsible fisheries practice says that "Sustainable development is the management and conservation of the natural resource base and the orientation of technological and institutional change in such a manner as to ensure the attainment and continued satisfaction of human needs for present and future generations". Such sustainable development (in the agriculture,

forestry and fisheries sectors) conserves land, water, plant and animal genetic resources, is environmentally non-degrading, technically appropriate, economically viable and socially acceptable (FAO 1997).

By "sustainable governance," we understand a governance, which takes care of environmental conservation, natural resource management in particular and "greening" of plans and policies and projects in general. It brings forth the issue of "green politics" and "green constituencies." If such a constituency is established, government would be sustainable. The environmental degradation we observe may be the result of unsustainable governance as much as of unsustainable development. The symptoms of unsustainable governance – perverse subsidies, open-access resources, and countervailing risk – are widespread and serious sources of environmental hazard. Narrow focus on sustainable development to the neglect of sustainable governance may leave problems unsolved. If it is to succeed, then, "sustainable development" must go arm-in-arm with sustainable governance. Sustainable development is holistic development. It accounts for the six dimensions of human welfare, namely, social, economic, ecological, political, cultural, and spiritual, without letting any dimension unduly dominate the others.

The environmental injuries arising from weak governance are well known. These include worldwide practice of government subsidies for environmentally damaging activities, such as logging, grazing, farming, mining, water use, dam construction, and fuel use. A second and more general form of weak governance occurs when the state does not or cannot protect security in property rights. The basic inability of the state to underpin market activity not only inhibits economic development in general but is often a prime contributor to environmental degradation.

## Earth Summit

Two decades have passed, since the world leaders assembled at Rio de Janeiro, Brazil, at the "Earth Summit" held in 1992 to chart a course of actions for this only habitable planet, called the Earth. The summit marked an important milestone in awakening the world to the need for a development process that does not jeopardize future generations. The Rio Conference achieved consensus in more than one area: first, it secured a set of agreements between governments which marks a significant advance in international cooperation on environment and development. Second, it marshaled political commitment to these arrangements at the highest level and placed the issue of sustainable development at the heart of international agenda. Third, it opened new paths for communication and cooperation between officials and nonofficial organizations working towards development and environmental goals. Fourth, it led to an enormous increase in public awareness leading to adoption of policies and allocation of additional resources to achieve the desired results.

The Earth Summit offered a unique opportunity to establish the basis for the major shift required to put this planet on the path towards a more secure and sustainable future. At the core of this shift, there is a felt need for fundamental change. Change to our economic life, a more careful and more caring use of the Earth's resources and greater cooperation and equity in sharing the benefits as well as the risks of our technological civilization. Of particular importance is the need to integrate the ecological dimension into education and culture as well as in economics. The summit adopted the United Nations Framework Convention on Climate Change (UNFCCC) aiming at stabilizing climate change; the UN Convention on Biological Diversity (CBD) aiming at conservation of biodiversity; the Earth Charter; the Forestry Principles; and the Agenda 21, which is a nonbinding *blue*-print for nations, a development pathway for the twenty-first century.

Targeting global environmental governance, the World Summit on Sustainable Development (WSSD) was held in Johannesburg, South Africa, in 2002. The summit took stock of developments since the Earth Summit 1992 held 10 years ago and implementation status of Agenda 21. Outcome of the summit was "Johannesburg Plan of Implementation." The declaration titled, "*The Future We Want*" was rather a weak document. It called for green development; green growth; and

green economy. It was agreed to enable the countries to undertake nationally driven greener development. Throughout the process leading up to the 2002 World Summit, the international community endorsed the need to integrate better three dimensions of sustainable development: the environmental, social, and economic dimensions of development.

### Multilateral Environment Agreements

There had been a series of conferences of parties of various multilateral environment agreements (MEAs) related to climate change, biodiversity conservation, ozone layer depletion, combatting desertification, and so on. Intentions of such a global environmental governance were to bring this planet Earth back to a habitable situation not only for this generation but also for the future generations. UN Framework Convention on Climate Change (UNFCCC) for example, at its 21st Conference of the Parties (COP-21) held at Paris, France, in 2015 adopted the "Paris Agreement" which made it mandatory for all countries to reduce carbon emission to 350 ppm, to keep the global average temperature well below 2 °C above preindustrial levels and to limit it to 1.5 °C. The country-parties signing the Paris Agreement are obliged to undertake country-specific policies and projects to meet their commitments. Similarly, conference of parties of other conventions also made substantial progress in biodiversity conservation, halting depletion of ozone layer, combatting desertification, withdrawing persistent organic pollutants, etc. Around 500 multilateral environmental agreements and a plethora of international organizations, doing the best they can to respond to environmental challenges that range from climate change to persistent organic pollutants.

MEAs have an important role to play in shaping global environmental governance. Increasingly, the countries of the world are signing and ratifying various conventions of global environmental interests and becoming parties to these conventions. Following ratification of these conventions, they are obliged to examine their national plans, policies, legislation, and projects and revise and redraft them in line with the commitments they made to the global community by becoming parties to these conventions. Often the Convention secretariats set up "Implementation Committees" in order to help the developing countries and the LDCs in particular to redraft their local legislation and undertake training programs for the officials. Implementation Committees of the UNFCCC and Montreal Protocol played an important role in implementing various provisions of the convention at a local level.

### United Nations Environmental Program

United Nations Environmental Program (UNEP) established in 1972 is a watchdog body to ensure that the MEAs are implemented by the signatory countries in their respective localities. UNEP has been playing a leading role as a global environmental authority. From delivering expert scientific assessments to providing international platform for negotiations and decision making, UNEP has been fulfilling this mandate since 1972. The country-parties (signatory states) of the MEAs are expected to implement these conventions, treaties, and protocols at national level by redrafting their national plans and policies and enactment of legislation in line with the MEAs. Conference of Parties (COP) being the supreme body of these conventions meet periodically (e.g., Conference of Parties of UNFCCC are held annually). Although UNEP with its headquarters in Nairobi, Kenya, does not hold much influence these days over the implementation processes of various MEAs because of establishment of independent secretariats (e.g., UNFCCC secretariat in Bonn, Germany; CBD secretariat in Montreal, Canada), the organization was the pioneer UN agency in upholding the cause of environmental governance globally.

### From MDGs to SDGs

Building on the UN Development Decades in the 1960s, 1970s, 1980s, and 1990s, the UN Millennium Development Goals (MDGs) adopted in 2000 marked a strong commitment to development; peace and stability; gender equality; eradication of many dimensions of poverty; and sustainable human development. Building on the UN global conferences of the 1990s, the MDGs

over the years made substantial progress in reducing poverty and hunger; improving education, healthcare, and water sanitation; and ensuring environmental conservation. MDGs were expected to be achieved by 2015, although poverty, hunger, illiteracy, maternal deaths, stunting growth of children, mortality, and morbidity continue to engulf many parts of the planet. Millennium development goals were followed by Sustainable Development Goals (SDGs) with the theme, *Transforming Our World: the 2030 Agenda for Sustainable Development* adopted in 2015 with 17 goals and 169 targets to be achieved by 2030. MDGs focused on both human development and environmental goals, while SDGs covered all three dimensions of sustainable development – the economic, social, and environmental and its interdependence. Another important aspect of SDGs is that it promoted peace and justice (SDG 16). "There can be no sustainable development without peace, and no peace without sustainable development." SDGs are bold and ambitious and instead of halving poverty, SDGs aimed at ending poverty. Governments were entrusted with the responsibility to implement them at a national level. There are various indicators established by the UN which would help the global community to evaluate their performance. Many developed, developing, and least developed countries could change their lot to a great extent by maintaining targeted developments with year-wise progress.

Both MDGs and SDGs adopted by the UN and signed by the global community were important milestones in ensuring environmental governance at a national and global level. In order to implement the second World Development Agenda goes by the name Agenda 2030 or Sustainable Development Agenda (2016–2030), popularly known as the Sustainable Development Goals (SDGs), many countries undertook mapping exercises with various ministries by targets in the implementation of SDGs aligning with their existing short- and long-term plans. It is understood that the development approach underlying the existing plans would be in consistent with the global agenda for higher growth with appropriate measures for protection of the environment. Special significance of this mapping exercise was the consultative process involving the NGOs, civil society, and the development partners.

## Environmental Governance: Institutions

At a national level, the parliament enacts legislation on environment. Parliament also approves annual budget on various development projects, including that on the conservation of environment and natural resources management. There is a dedicated "Parliamentary Committee on Environment" composed of members of the parliament, entrusted with the responsibility to monitor progress of implementation of environmental plans, policies, and projects of the government. Various ministries and departments of the government are responsible for running environmental governance. The cabinet of ministers headed by the head of the government is primary responsible in providing overall guidance and ensuring implementation of various plans, policies, and enforcement of laws on environment. In some countries, there is a National Economic Council (NEC) and Executive Committee of the National Economic Council (ECNEC) headed by the Head of the Government approving and monitoring various development projects including that on environment and forests. In some countries, there is a "National Environment Council" – headed by the Head of Government overseeing implementation of plans, policies, and projects on environment and also coordination of intersectoral issues. The decisions taken by the committee are executed by an Executive Committee of National Environment Council – headed by the Minister of Environment and Forests.

Generally, there is a dedicated ministry named the Ministry of Environment and Forests, headed by a minister, who looks into issues related to conservation of the environment and forests. All plans and policies are implemented by a group of professional executives and bureaucrats at the ministry. The Department of Environment (DOE) headed by a Director General looks into day to day enforcement of laws. DOE is the

technical arm of the ministry, providing technical advices to the ministry and enforcement of laws. In some countries, there is a separate ministry dedicated for environmental conservation. There is also a "Department of Forests" headed by the Chief Conservator of Forests, tagged with the Ministry of Environment and Forests looking into biodiversity and forest conservation.

Environment being a cross-sectoral issue, a number of sectoral ministries and departments are engaged in addressing issues related to environment. The Ministry of Fisheries and Livestock and its subordinate organ, the Department of Fisheries, are for the conservation of fisheries biodiversity and enforcement of laws halting depletion of fisheries. Similarly, the Ministry of Water Resources headed by a minister is responsible for sustainable water management, the Ministry of Industry is responsible for promoting pollution-free industries, and so on. Other organizations engaged in guiding the government in environmental governance are the media (both print and electronic), civil society bodies, academia, advocacy groups, and right-based groups. They are the watchdog groups in putting pressure on the government for ensuring good environmental governance.

## Environmental Governance: Processes

Environmental governance could be both centralized and decentralized. In a centralized, "top-down" approach, the policies and plans are adopted and decisions are taken by the government following a centralized way of consultations among the technocrats and bureaucrats of different government ministries and departments. On the other hand, "decentralized environmental governance" ensures that decisions are taken; plans and policies are adopted through grassroots consultation. It is also known as "participatory environmental governance" following a "bottom" process. In other words, development planning follows a Multi-stakeholder Integrated Sustainability Planning (MISP) model. The innovative concept of MISP is a departure from conventional development planning. It is an integrated approach of planning in pursuit of sustainable development, involving various sectors and components of the ecosystem, meaning the stakeholders. MISP is multidisciplinary. It integrates economic, social, ecological, political, cultural, and spiritual concerns towards a holistic and sustainable development. For effective running of environmental governance, participatory planning involving the grassroots people is necessary, which would ensure "ownership" of the affected people, project victims – the stakeholders in the planning process. Such a participatory planning process would ensure that views and concerns of the grassroots people on environmental degradation, depletion of biodiversity, industrial pollution are reflected through governance of a country.

## Environmental Governance: Challenges

Some of the obstacles and challenges facing the environmental governance are: (a) how to implement the multilateral environmental agreements at the national, regional, and global levels, as numerous such agreements were signed by the global community since Stockholm Conference held in 1972; (b) how to develop the national plans, policies, and enactment of environmental legislations in line with the MEAs for natural resource management; (c) how to resolve conflict of interests among some of the MEAs (e.g., Article 27.3 (b) of Trade Related Intellectual Property Rights (TRIPs) goes against the principles of Articles 8 and 15 of the UN Convention of Biological Diversity); (d) how to ensure long-term budget allocation by the respective national governments for halting environmental degradation, biodiversity conservation, and disaster risk reduction; (e) how to ensure effective coordination and collaboration between the government, various sectors of the government, nongovernment organizations, private sector, and the civil society bodies in arresting environmental pollution and environmental conservation; (f) how to prioritize environment over other sectors of development, like agriculture, health, education, and security;

(g) how to ensure continued political commitment and consensus in the parliament on natural resource management irrespective of changes of the government; and (h) how to raise environmental awareness among members of public and develop a "green constituency," who would speak against pollution, degradation, and encroachment.

## How to Overcome the Challenges

In order to overcome these challenges, the role and responsibilities of the government; parliament; judiciary; civil society bodies; academia; media (both print and electronic); and social network (e-mail, Facebook, Twitter, WhatsApp) are noteworthy to mention. Their involvement in overcoming the challenges is narrated below:

(a) **Government**: Macro and microlevel sectoral plans and policies are developed, updated, and implemented by respective government ministries and departments depending on priorities and commitments of the central government. Implementation of MEAs by respective government ministries/departments also depends on the commitment of the government. As a signatory to various multilateral environmental agreements, government has to translate them in national plans, policies, projects, and laws. Political commitment irrespective of changes of the government is necessary for implementation of long-term plans like Five Year Plan, Strategic Plan, Perspective Plan, sectoral Master Plans and policies, allocation of budget, etc. In this regard, establishment of a "green constituency" is necessary, which would play a pivotal role in electing political parties speaking for the environmental conservation.

(b) **Parliament**: Finalization of plans and policies without legislation is like a "toothless tiger." Laws are enacted in the national parliament and the parliamentary committee on environment is entrusted with the responsibilities to oversee enforcement of environmental projects and laws. Members of the Parliament (MPs) play an important role in enacting laws in line with natural resource management and constraints. Awareness and training of the MPs are noteworthy to mention.

(c) **Judiciary**: Judiciary, another organ of the state, plays a significant role in environmental governance. It is often seen that the judges are issuing *suo motu* rules on the government for halting environmental degradations like river pollution, air pollution, land grabbing, encroachment of forest lands, etc. Establishment of "Environmental Courts" by the government and proper awareness raising and training of the judiciary could help effective enforcement of environmental laws.

(d) **Civil Society and Media**: Civil society bodies and print and electronic media continue to play an important role in natural resource conservation in general and halting pollution, encroachment, and land grabbing in particular. They help the government in ensuring proper environmental governance. They are to be allowed to perform their responsibilities without any censorship, hindrance, and obstacle. Awareness and training of media persons are necessary in this regard.

(e) **Social Network**: These days, social media like Facebook, LinkedIn, and WhatsApp have become very popular among the general mass in general and young people in particular. Social network so far has been able to halt many environmental degradations through mass campaign, procession, and advocacy. Uninterrupted social media without interference is necessary for the safeguard of the environment.

## Conclusion

Environmental governance continues to face many challenges locally, nationally, and globally. Although the global community endorsed the view that global warming is taking place and gave emphasis on promotion of renewable energy discarding fossil-fuel based energies, many

developed countries continue to use fossil fuels in a big way for their energy use. Group interests, regional interests take priority over global interests. Unanimous support to "Paris Agreement" at Paris in 2015 faces new challenges with the change of government (e.g., recent change in US government). Petty local interests getting priority over national and global interests. At a national level, new regime refuses to honor global commitments made by the past regimes, some governments are found to be serving the interests of some coterie groups and putting more emphasis on fossil fuels, like coal and petroleum at the cost of environment-friendly renewable energy. Some global leaders are taking benefit of scientific disagreements and continue to harness natural resources to a point of no return.

The crises caused by accelerated and probably irrevocable impact of human activities on the nature, society, and economy calls for collective responses by international institutions, governments, and citizens. Governance, considered as the pluralist management of policies and social and environmental actors, has to meet this crisis by pooling the experience and knowledge of each of the social agents and institutions concerned. Through continuous and concerted efforts with strong political will and commitment, one could overcome such crises. Public awareness through media advocacy and education can help develop a strong constituency in order to establish the desired political will for a change.

# Environmental Injustice in Urban Settings

Paul D. Reynolds and Janiece Upshaw
UNT-Dallas, Dallas, TX, USA

## Synonyms

Green criminology; Environmental issues in urban areas; Urban planning and sustainability.

## Definitions

***Environmental justice*** – *Fair treatment and meaningful involvement of all people regardless of race, color, national origin, or income, with respect to the development, implementation, and enforcement of environmental laws, regulations, and policies.*

***Urban areas*** – *Locations with a population that exceeds 5000 and population density greater than 400 individuals per square kilometer.*

## Introduction

There are more than one thousand reported incidents of environmental injustice that occur daily around the world which are cited in the Environmental Justice Atlas website (https://ejatlas.org). The topic of environmental justice captures the public's attention because of its infamy and egregiousness. There is no doubt ecological additions and withdrawals, pollution, and overconsumption continue to shape our world (Lynch et al. 2017). Actions taken by corporate and governmental entities hinder the quality of life and harm individuals who have limited economic and political influence, and lack influence to mobilize. More disheartening is the fact that the consequences of these criminal and harmful actions are disproportionality distributed among minority groups, causing significant hardship for many of the world's most vulnerable groups. While there is no shortage of environmental injustices around

the world in both urban and rural settings, this entry explores the concept of environmental injustice in urban settings. First, we will discuss what is meant by environmental justice. Next, we will discuss the main factors linked to environmental injustice. In the final sections, we will describe how the critical issues concerning environmental justice in urban settings relate to policy design. This entry focuses on urban settings for two important and practical reasons. First, the large majority of people in the United States live in urban and suburban areas. Next, the extant research and case studies are majorly oriented toward urban areas.

## What Is Environmental Injustice?

In the United States, geographic areas are classified as urban based on a population greater than 5000 and a population density greater than 400 individuals per square kilometer (about 0.39 square mile). For example, New York has a population density of over 26,000 people per square mile. Urban areas provide many beneficial opportunities for individuals, including better access to medical facilities, institutions of higher learning, entertainment and cultural activities, and increased employment opportunities. Unfortunately, high population density also creates increased environmental issues and concerns including, but not limited to the overexploitation and consumption of natural resources, problems with managing solid waste, limited open space and green areas, air pollution, water pollution, noise pollution, and waste management issues to name a few. Of importance to the topic of environmental justice in urban areas is the overwhelming evidence from academic disciplines that poor and minority individuals often suffer disproportionately from environmental-related harms and illnesses.

Approximately 80% of the population in the United States live in urban areas. Decades of research in the USA and abroad reveal that a disproportionate amount of industrial hazards and waste are located in poor and ethnic minority neighborhoods. International data supports that over 90% pollution related deaths occur in middle and lower socio-economic countries with diseases and adverse health conditions tied to pollution more prevalent among minorities. Furthermore, these same groups often have less access to green spaces or natural settings. Across the globe, researchers continue to see an increase in environmentally induced diseases and other health concerns due to a lack of regulations and safety measures by government and corporate entities. For this reason, understanding the issue of environmental injustice in urban settings is critical for policy design and spatial equity, because the environment in which people live often determines their health and economic opportunities.

According to the US Environmental Protection Agency, "Environmental justice is the fair treatment and meaningful involvement of all people regardless of race, color, national origin, or income, with respect to the development, implementation, and enforcement of environmental laws, regulations, and policies (2018, n.p.)." Conversely, environmental disparities caused by human actions or inactions that create disparities based on race, ethnicity, social class, or income are often referred to as environmental injustice (Lester 2018). Thus, environmental injustice occurs when institutional rules, regulations, policies, and decisions of government or corporate actors create an environmental hazard or burden upon a particular group or hinder their access to nature or healthy living environments. Race/ethnicity, income, and political mobilization are the three primary factors linked to environmental injustice (Lester 2018). For example, asthma and other respiratory issues disproportionately impact low-income and minorities in urban areas due to disparities in the quality of housing and higher rates of exposure to toxic, and access to health care (Brown 2007).

While this entry focuses primarily on environmental injustice in urban areas, varying types of environmental abuses occur in and suburbs across the United States. From mountaintop mining in the Appalachian Region, to environmental illness in the State of Louisiana caused by the petrochemical industry – nicknamed "Cancer Alley," to lack

of access to clean water in Flint, Michigan and Sandbranch, Texas.

- In 2008, over a billion gallons of coal fly ash slurry was spilled from the Tennessee Valley Authority's Kingston Fossil Plant polluting nearby water, flooding acres, and causing substantial damage to local residence and businesses.
- Cancer Alley is an area along the Mississippi River between the cities of Baton Rouge and New Orleans in Louisiana that holds over 200 petrochemical facilities resulting in toxic air pollution that has substantially increased the rates of individuals living in that area of developing cancer and other illnesses.

  In 2013, many of the residents of Flint, Michigan, suffered negative health effects due to improperly treated water and the lead leakage from old pipes when the city reduced costs by switching from the Detroit water supply to the heavily polluted Flint River
- A water treatment plant in Dallas, TX, built on the edge of the unincorporated freedmen community, founded following the Civil War, in Sand Branch, Texas, is believed to have contaminated the local well water that had been their primary water source since its founding, thereby causing the residents to lose complete access to fresh drinking water.

## Historical Overview of Environmental Injustice in the United States

One of the earliest and most well-known cases that brought national attention to disparities in environmental decisions and was viewed as the primary spark that ignited the environmental justice movements involved a conflict over the placement of a soil dump contaminated with Polychlorinated Biphenyls (PCBs) in Afton, NC. Afton is located in Warren County and is not only among the poorest counties but also has one of the highest population percentage of blacks in the state. Although the denizens of Warren County were unsuccessful in stopping the landfill, the national media attention and grass roots efforts led to an environmental justice summit to be convened in Washington, D.C., in 1991. This summit led to delegates adopting 17 defining principles of environmental justice and the creation of the Office of Environmental Justice by the U.-S. Environmental Protection Agency in 1992 (Bullard 2000). In 1994, President Clinton signed Executive Order 12898 *"Federal Actions to Address Environmental Justice in Minority Populations and Low-Income Populations"* which sought to:

- Protect the environment and health in overburdened communities.
- Empower communities to take action to improve their health and environment.
- Establish partnerships with local, state, tribal, and federal governments and organizations to achieve healthy and sustainable communities. For more information go to (https://nepis.epa.gov/Exe/ZyPDF.cgi/P100DFCQ.PDF?Dockey=P100DFCQ.PDF).

While some progress has been made, issues of environmental justice continue to be prevalent today.

### Empirical Support for Environmental Injustice

Over the last 30 years, copious studies support the link between race, ethnicity, social class, and income with environmental risks and benefits originating from early genres of study including environmental racism and environmental inequity (Bullard 2000; Lester 2018). Furthermore, emerging research has continued to support earlier findings that varying types of pollutants and ecological additions are associated with adverse medical and health related issues (Bullard 2000; Lester 2018; Lynch et al. 2017). Robert Bullard, who is often described as the "father of environmental justice" for his early research on spatial inequality, provided evidence that black neighborhoods in Houston, Texas, were bearing the larger share of pollution. Even though black residents made up only a quarter of the population, over 80% of the garbage in the preceding 40 years was dumped in neighborhoods with a majority of black residents (Bullard 2000).

Extant research examining the socio-spatial distributions of varying types of hazardous industries provides substantial empirical evidence supporting the disproportionate presence of toxic industries, water treatment plants, and waste dump sites in minority and impoverished communities in the USA (Bullard 2000; Lester 2018).

These disparities are more salient in the South, arguably deriving from racial historical institutional practices that restricted minorities from living in certain areas or even acquiring property. However, research has also found some exceptions and abnormalities to the spatial distribution of industry and race. For instance, in some cities the industrial sections are located in predominantly white neighborhoods resulting from historical policies that prevented blacks from living near factories or in certain neighborhoods. In many circumstances, decisions may be more reflective of where whites geographically reside compared to minority communities (i.e., white privilege; Pulido 2000; Simon 2000).

Still, others argue that many of the events viewed as environmental injustice are merely a result of economic prudence rather than racial bias touting the association between the placement of hazardous facilities including land prices, zoning ordinances and policies, and the lack of social capital (Lester 2018). From this perspective, hazardous facilities are often located in low socio-economical areas because they often have less zoning restrictions and cheaper property. Thus, disparities are more correlated to poverty rather than race. However, studies still find overwhelming evidence of environmental injustice, particularly against communities of color, even when controlling for income (Bullard 2000).

## Environmental Concerns in Urban Settings

Environmental health problems (sometimes referred to as environmental induced diseases) can be described as "... the health effects caused by toxic substances in people's immediate or proximate surroundings (soil, air, water, household goods)" (Brown 2007, p.1). While people are becoming more informed about the effects of genetic factors and lifestyle choices on different types of diseases, data from public polling supports that many people also hold strong beliefs that environmental factors play a major role in many types of illnesses such as sinus and allergy problems, colds and flus, asthma in children, cancer in children and birth defects (Brown 2007; Olsson et al. 2017). These beliefs may be warranted, if not justified, given our growing understanding of the link between the environment and personal health. According to the Lancet Commission on Pollution and Health report, pollution is the leading environmental cause for disease and premature death (Landrigan et al. 2018). The authors posit that "(d)iseases caused by pollution were responsible for an estimated 9 million premature deaths in 2015 - 16% of all deaths worldwide - three times more deaths than from AIDS, tuberculosis, and malaria combined and 15 times more than from all wars and other forms of violence" (Landrigan et al. 2018, p.1) .

There is no shortage of environmental hazards that can impact the quality of life of individuals. Some of the biggest environmental issues affecting urban areas include air pollution, water pollution, lead poisoning, mercury poisoning, industrial, and manufacturing sites, and the lack of green spaces. Many of these environmental hazards are linked to health problems and concerns such as increased cancer, heart disease, and respiratory risks. Beyond direct health concerns to a community, diseases linked to environmental hazards can hinder productivity in terms of sick days and illnesses and can substantially increase health costs.

### Air Pollution

Air pollution remains a serious problem around the world in many urban areas due to increased pollutants released into the environment through manufacturing and transportation. The over exposure to pollution and hazards such as nitrous oxides and carbon monoxide can lead to asthma, cancer, neurodevelopmental disorders, and even birth defects in children. According to the EPA, more communities of color live in counties that are in violation of federal air pollution standards, as compared to communities with predominantly white residents (Bullard 2000).

Furthermore, research supports that children, in poor or minority neighborhoods, are the most impacted by air pollution. For example, a study by Chakraborty and Zandbergen (2007) in Orange County, Florida, showed a statistically significant disparity in the racial proportionality to the exposure to different types of air pollution among black and Hispanic children compared to white children. Findings also showed that children, regardless of race, were more often exposed to harmful pollutants at school than when home as schools are often located adjacent to heavily traveled roadways.

Currently, the Environmental Protection Agency (EPA) in the United States tracks 187 hazardous air pollutants including acrolein, benzene, chromium VI, ethylene oxide, and formaldehyde, which can create health risks due to inhalation exposures. On a positive note, air quality in the United States has improved since 1990 according to the 2014 National Emissions Inventory (NEI) data published by the (EPA) in terms of Carbon Monoxide (CO), Lead (Pb), Nitrogen Dioxide ($NO_2$), and Sulfur Dioxide ($SO_2$).

### Water Pollution

The degradation and pollution of waterways is a major issue in many urban areas. Runoff from roads can carry oil, rubber, and other contaminants, in addition to nutrient and bacterial sources of contamination including pet wastes, pesticides and fertilizers. Leaking landfills, untreated or poorly treated sewage, and waste water can create pollution that results in the degradation of aquatic ecosystems. Furthermore, construction can limit the amount of water that percolates into the ground reducing the amount of water in the underground water table while simultaneously reducing the overall quality of surface water. Water pollution is the leading worldwide cause of death and disease (e.g., cholera, amoebiasis, dysentery).

### Lead Poisoning

One of the most common and preventable health concerns today is lead poisoning with children under the age of six being especially vulnerable. In the United States alone, there are more than 200,000 cases per year. Lead poisoning is caused by the inhalation or absorption of large amounts of lead into the body by breathing in or swallowing substances that contain lead. Lead poisoning can severely harm mental and physical development. The most common sources are from lead-based paint, lead water pipes, and contaminated dust in older buildings. Although lead-based paints were banned in the United States in1978, traces of lead can still be found in many older homes.

### Mercury Poisoning

Exposure to mercury often occurs when products break or when metallic mercury is spilled. Based on its chemical form (elemental, inorganic or organic), mercury can cause a myriad of adverse health conditions. Methylmercury can result when high levels of mercury are absorbed in the body. The most common cause of mercury poisoning in the United States is when individuals consume fish or shellfish that contain high levels of methylmercury in their tissue (see Minamata disease). Mercury can be found in contaminated soil and several types of manufactured products (e.g., compact fluorescent lights, batteries). High exposure levels to mercury can result in permanent nervous system or kidney damage, hair loss, vision issues, and behavioral changes in adults. Exposure to mercury by fetuses and infants can lead to intellectual delays, cerebral palsy, and other medical problems. Additionally, children exposed to mercury can develop acrodynia in which skin begins to turn a pinkish color and peel.

### Industrial and Manufacturing Hazards

There is little doubt that industrial and manufacturing sites have a direct influence on the surrounding ecosystems fostering increased global warming, water pollution, air pollution, and soil pollution. Harmful chemicals are constantly being released by industrial and manufacturing processes exposing individuals to environmental hazards. Even though many urban areas in the United States still contain industrial or manufacturing areas, sites have steadily been decreasing as manufacturing plants have closed or corporations have moved operations overseas to reduce costs.

Since the early 1980s, the United States shifted from heavy manufacturing to light manufacturing and specialty production, which resulted in many factories, mills, and machine shops to close, creating abandoned areas referred to as "*brownfields*." These buildings often have containment pollution and continue to pollute the area as the buildings decay. However, there is renewed effort in many cities to repurpose these buildings under urban redevelopment plans in an effort to reduce their environmental impact and potentially create new jobs and commerce.

### Illegal Dumpsites

Illegal dumping can be described as the disposal of domestic, commercial, or industrial waste by unlawful means or in unauthorized areas. Illegal dumping can occur for a myriad of reasons including the lack of environmental enforcement, avoidance of disposal fees, people disposing their garbage improperly, or lack of available trash or disposal services. These sites can be a serious problem for many communities that lack the political influence or resources to have regulations enforced or do not receive services to have litter and discarded items removed. They can create environmental hazards along with devaluing property and reducing tourism. Furthermore, illegal dumpsites can create large clean-up costs to local governments that fail to implement prevention and environmental enforcement programs. Regardless of the cause, illegal dumping can adversely affect the environment due to harmful chemicals released in the air, soil, and water.

### Lack of Green Space

A growing body of research has linked green spaces to health and well-being. Green spaces can include greenway trails, parks, golf course, athletic fields, vegetation biomass, or other green open spaces. These recreational areas allow people to exercise, relax, or have social gatherings. Green spaces increase the beauty of communities while simultaneously improving air quality and decreasing greenhouse gases. Studies provide evidence that people with higher income and education tend to have greater access to green spaces along with a higher distribution of vegetation and trees on their streets and in their yards. Individuals living in urban areas have less access to green spaces than individuals living in suburbs or rural areas. Furthermore, members of the lower socioeconomic class often lack the financial ability or opportunity to utilize green spaces located elsewhere such as national or state parks. However, recent projects in many dense urban areas to develop city-wide greenway trails and parks across the city have provided greater access green spaces (Wolch et al. 2014).

While the aforementioned issues continue to be major points of concern across the country, some urban areas have created programs and green initiatives to address these problems and promote more ecological and sustainable environments. As population increases, urban planners will need to find innovative ways to balance growth and environment sustainability. These activities can be in the form of developing greenways for recreational activities to requiring residents to have green roofs. Moving toward an "ecocity" framework can help address many of these issues at a local level.

## Conclusion

The intersection between ecological hazards and social equality is well documented. Environmental issues in urban areas include, but are not limited to, air pollution, water pollution, lead positioning, mercury poisoning, industrial sites, illegal dumpsites, and the lack of green spaces (Bullard 2000; Lynch et al. 2017). Minority communities and low-income neighbors are often disproportionately burdened with environmental concerns and hazards creating issues of environmental injustice. Unfortunately, children are most adversely affected by environmental injustice in urban areas (Chakraborty and Zandbergen 2007). Children living in communities of color or lower-income neighborhoods lack green spaces and are often over exposed to environmental harms. These factors can lead to increased rates of asthma, cancer, neurodevelopmental disorders, and even birth defects (Wolch et al. 2014).

Communities confronted with environmental inequalities must find ways to organize, hold public protests, create petitions, voice concerns to political leaders, and interact directly with organizations that are harming the environment. The necessity for citizen action is imperative to calling attention to occurrences of environmental injustice and finding ways to solve these types of problems through social movements and political activism from the local to the international level (Bullard 2000). For example, residents of Union Hill, VA, were able to stop a gas-fired compressor station from being built in 2020 in their community through political activism. One of the biggest issues today that still hinders many communities of color from safeguarding themselves is the lack of political mobilization due to limited advocates, lobbyists, political influence, financial resources, and access to information (Bullard 2000). For this reason, it is crucial that political leaders work with environmentalist and urban planners to create new programs and policies that promote sustainability and decrease environmental injustice.

# Environmental Issues in Kazakhstan

Kristopher D. White
College of Social Sciences, KIMEP University, Almaty, Kazakhstan

## Introduction

Kazakhstan, once a republic of the USSR, gained independence in 1991. Comparatively large in land area (ninth largest in the world) with a modest population of 17 million, Kazakhstan is among the world's most sparsely populated countries. Kazakhstan, located in Central Asia landlocked and distant from the open oceans, shares borders with Russia to the north; China to the east; Kyrgyzstan, Uzbekistan, and Turkmenistan to the south; and the Caspian Sea to the west. Most of its territory consists of flat, semiarid steppe grasslands though major mountain systems ring the southeast, east, and northeast and desert prevails in the southwest. Kazakhstan's economy is largely based on its vast natural resource wealth, particularly petroleum.

Kazakhstan became a full-fledged Soviet republic in 1936. Governance largely emanated from distant Moscow, and Kazakhstan became a location for exiled political prisoners, a forced settlement of nomadic populations, the center for Soviet space launches, the major nuclear testing site, and biological weapons production and testing. Today Kazakhstan can be classified as a

unitary authoritarian state with political power concentrated with the president. From the late Soviet period to 2019, Kazakhstan was led by Nursultan Nazarbayev. In March of 2019, Nazarbayev, aged 79, resigned from the position of president and named Kassym-Jomart Tokayev as the next interim leader. Nazarbayev retains popularity and a certain cult of personality: he was once appointed to the lifelong position of "Leader of the Nation" and on his surprise resignation Kazakhstan witnessed the quick renaming of the country's capital, Astana, to Nur-sultan. In June 2019, Tokaev became president amid crackdowns on protesters following an internationally-criticized election.

During Kazakhstan's first 25 years of independence, political development (including state and nation-building) and economic concerns have understandably taken priority. Kazakhstan has been the site of many instances of Soviet-era mismanagement with respect to environmental resources. Specific environmental issues examined here are the Aral Sea crisis, ramifications from nuclear testing, and threatened wildlife species. For these issues, good environmental governance is crucial for Kazakhstan's sustainable development moving forward.

## The Aral Sea

### Introduction

The story of the Aral Sea, unfolding over the past five decades, is one of the world's worst human induced environmental catastrophes. The Aral, despite its name, was a large, slightly saline inland lake – the fourth largest lake in the world after the Caspian Sea, Lake Superior, and Lake Victoria. Today, what remains of the Aral is scattered across western portions of the Kazakhstan-Uzbekistan border, about 15% the size in area and volume that it once was. Rusting ships abandoned in the desert have become iconic images associated with the shrinking, disappearing Aral Sea. They have also symbolized the environmental destruction and socioeconomic misery resulting from the Aral Sea crisis.

The cause of the Aral Sea disaster was the unsustainable and ultimately catastrophic mismanagement of freshwater resources in the Aral Sea basin. During the mid-twentieth century, the USSR viewed the major river systems of the *Amudarya* and *Syrdarya* as sources of irrigation, allowing the production and harvest of cotton and other agricultural products in this arid region of Central Asia. Originally conceived as part of what has been termed the "Stalin plan to remodel nature," massive networks of dams and irrigation canals, and related hydrologic infrastructure were constructed to siphon water from the rivers. A showcase among these is the Karakum Canal, the world's longest irrigation canal, begun in 1955 and today continuing to divert Amudarya water across the entirety of the desert republic of Turkmenistan. In line with the Soviet ideology of human conquest over nature, the primary economic impact of this intervention was a drastic increase in arable land and the cultivation and harvest of cotton. In one sense, these efforts might be viewed as successful as the Soviet Union became a world leader in the production of cotton. For the Aral Sea, however, as well as many of the region's inhabitants and ecosystems, crisis ensued.

By the late 1980s the shrinking lake had split into two sections, a much smaller northern part (Northern or Small Aral) in Kazakhstan and a much larger Southern Aral partly in Kazakhstan but mostly in the Karakalpakistan autonomous region of Uzbekistan. Desertification and crisis conditions have prevailed throughout the Aral Sea region to the present. Environmental impacts of this crisis have included the rise in lake salinity levels, approaching three times those of the open ocean. Fish no longer could survive the loss of lake habitat and high salt levels. Wetland habitat was also lost, leading to a sharp decrease in migratory bird populations. Infamous dust storms have also plagued the region, with salt and agricultural chemicals (applied heavily during the Soviet period) poisoning the air. Human populations have suffered greatly here. The region's fishing industry collapsed, leading to unemployment and poverty. Poor nutrition and a host of poverty-related diseases remain. Salt and agricultural

chemicals in the ecosystem and food chain assault populations from the air they breathe and the food they eat. Rates of respiratory diseases, cancers, and infant mortality rates remain high.

### Current Situation

By the start of the twenty-first century, the Aral continued its retreat and desert replacing the lake, a number of attempts were made to erect dams across Berg's strait and to stabilize the Northern Aral Sea (NAS). Though ultimately unsuccessful, these paved the way for what has resulted in much needed regional optimism. The 2005 completion of the Kok-Aral dam and 13 km dike complex has stabilized the NAS at a height of 42 m ASL, a 2 m rise from the pre-dam level. This joint $86 million project between the World Bank and the Kazakhstan government has been successful, leading to modest improvements in the ecological health and socioeconomic wellbeing in this part of Kazakhstan. The project's design height for the NAS was reached in a matter of months as fresh water inflow from the Syrdarya has been retained. The NAS has been stabilized, salinity levels have decreased to precrisis levels, and wetland habitats have been restored. With this, aquatic species and migratory birds have made a recovery. Perhaps most importantly for the regional economy, fish have also returned to the NAS. Total fish harvests have increased more than six times since 2005. This has meant regional stimulus with respect to employment and income in the harvesting, processing, retail, and transport sectors.

Despite popular press accounts heralding the "return" of the Aral Sea, since the dam's completion the NAS has increased a rather modest 18% in area and volume, still a fraction of its size in 1960. Fish harvests today on the NAS are approximately 25% of what this part of the lake yielded in the late 1950s. While modest success and improvements can be seen in Kazakhstan's NAS region, the southern Aral in Uzbekistan continues to be mired in crisis. The eastern basin of the southern Aral completely disappeared in 2014 for the first time in history. The western basin, which will continue to survive given its depth, has very high salinity levels and is devoid of fish and all life.

## Nuclear Testing

### History

The Soviet Union's major nuclear testing site, active between 1949 and 1989, was located in northeastern Kazakhstan near the city of Semipalatinsk (now Semey). The world's largest such site at more than 18,000 km$^2$, USSR officials selected this location for its proximity to river and rail transport and relative proximity to the existing nuclear industry in Russia's southern Ural region. Perhaps most important was Kazakhstan's sparse population and expansive open spaces. Over the course of its existence, the Semipalatinsk Nuclear Testing Site (often referred to simply as The Polygon) witnessed more than 450 nuclear explosions. The first of these, on August 29, 1949 and code-named "First Lightning" was a hydrogen bomb with an explosive force over three times greater than the bomb dropped on Hiroshima by the USA in 1945. A shift in weather patterns pushed nuclear fallout over nearby villages. A Soviet expedition to the region to investigate possible public health effects of testing in 1954 reported human impacts (i.e., hair loss and skin lesions) akin to Japanese survivors at Hiroshima.

Atmospheric and above ground surface testing continued here until ratification of the Partial Nuclear Test Ban Treaty in 1963. Between 1949 and 1963, more than 100 above ground explosions exposed between 500,000 and 1,000,000 people to elevated doses of radiation. Post-treaty tests were conducted underground, though leaks often released radiation above ground and into the atmosphere. One prominent location for underground testing within the Polygon was Degelen Mountain, which remains highly radioactive today. By the late 1980s, public anit-testing pressure began to mount. Led by Kazakh poet Olzhas Suleimenov, the Nevada-Semipalatinsk anti-nuclear organization gave rise to a large and powerful grassroots movement. By August of 1991, Kazakh SSR leader Nursultan Nazarbayev called for the closure of the Semipalatinsk Nuclear Testing Site, and the USSR Defense ministry capitulated.

### The Issue

Human exposure to radiation in Kazakhstan's Polygon region continues today. While direct exposure from nuclear blasts diminished greatly following the above-ground test ban and tests stopped entirely here in 1989, radioactive isotopes remain within the ecosystem. External exposure emanates from still-contaminated ground surface areas, and residents also face internal exposure through ingestion of contaminated food and water. Environmental impacts of four decades of nuclear testing include contaminated soil and groundwater, elevated radiation levels in vegetation, and overall radioactive particles persisting in the region's ecosystem. Adverse health effects and overall human suffering have also been apparent here. Elevated instances of various cancers continue to plague the region. Chief among these are cancers of the liver, lung, esophagus, skin, eye, breast, and leukemia. Genetic mutations have been passed on through generations, having led to birth defects and mental retardation. Weak immune systems, thyroid disease, and advanced aging have only added to the overall psychological stress for the region's populous. High rates of suicide have also been documented.

## Threatened Wildlife

### Snow Leopard

#### Introduction

The Snow Leopard (*Panthera uncia* or *Uncia uncia*) is a majestic large cat inhabiting high altitude alpine environments of central Eurasia. The animal's elusiveness and harsh inaccessible habitat is thought to have contributed to its continued survival in the wild and inexact range of population estimates. Between 4,000 and 7,000 snow leopards survive in the wild today across 12 range states (Russian, Mongolia, China, Bhutan, Nepal, India, Pakistan, Afghanistan, Tajikistan, Uzbekistan, Kyrgyzstan, and Kazakhstan). As few as 100 individuals inhabit the northeastern, eastern, and southeastern mountains of Kazakhstan. Despite a low population total (exceeding only Russia and Uzbekistan) Kazakhstan's snow leopards and habitat provide a vital spatial and genetic link between populations to the north and south. The snow leopard is also a ubiquitous cultural symbol in Kazakhstan.

#### The Issue

In 2017, the International Union for the Conservation of Nature (IUCN) changed the status of snow leopards globally from "endangered" to "vulnerable." This so-called delisting might give the impression that snow leopards are somehow less threatened in the wild, though in reality the rate of population decline for the specie has simply decreased somewhat. Numerous threats from humans continue to plague snow leopards. The primary threat is the continued killing of these animals, most commonly by herders in retaliation for livestock losses. Others are occasionally poached for their fur or internal organs in demand for traditional Chinese medicine. As snow leopard prey species (e.g., ibex and blue sheep) have been over hunted, livestock become an increasingly attractive food source, increasing the likelihood of retaliatory killings. Other threats include future habitat loss stemming from climate change and encroachment of human settlements.

### Caspian Seal

#### Introduction

The Caspian Seal (*Pusa caspica* or *Phoca caspica*) is the only mammal living in the Caspian Sea, the world's largest inland water body bordered by Russia, Azerbaijan, Iran, Turkmenistan, and Kazakhstan. This wildlife species is endemic to this ecosystem, meaning it exists in the Caspian and nowhere else on Earth. In 2008, the IUCN's Red List of threatened species officially labeled the Caspian Seal as "Endangered." Today, total population numbers of this animal are estimated at around 100,000 individuals. This is a dramatic decline from the as many as 1.5 million Caspian Seals alive in 1900. As these animals tend to migrate across the Caspian, estimating population numbers living in Kazakhstan's territorial waters

is difficult and unwarranted. Kazakhstan's Caspian waters are, however, vital for the continued survival of this specie. By early autumn, seals migrate north for the annual breeding and birthing process. The northern waters of Kazakhstan (and to a lesser extent Russia) are less saline than those of the south and provide January and February ice cover for the birth of newborn Caspian Seal pups.

### The Issue

The Caspian seal's endangered status and drastic population decline (as high as 90%) over the course of the past century is largely the result of direct human activity. For many decades the seal was actively hunted and harvested commercially for its blubber and, in the case of young seal pups, fur. By the late 1990s, commercial harvesting ceased, though continues today in Russia. Contravening the IUCN's guidelines for endangered species, Russia currently issues a limited number of commercial harvesting permits allowing hunting seal pups for their fur. While commercial harvest has been nearly eradicated across the Caspian, poaching (illegal hunting) of seal pups remains a threat, particularly in the northern breeding and birthing territories of Russia and Kazakhstan. Caspian seals are also killed by nets used to catch (illegally as these are also protected) sturgeon. Underwater netting large enough to snare sturgeon do the same for seals. Ultimately the entangled seals are unable to return to the surface and eventually drown.

Relatively high concentrations of pollution in the Caspian Sea represent perhaps the most important threat to these seals today. One source is industrial and agricultural chemicals draining into the Caspian from its feeder rivers (like the Volga or Ural). Pesticides (DDT) have been detected in Caspian seal blubber and cause lower fertility rates. Another source of pollution is contaminants from oil spills and leaks from offshore drilling sites. This pollution is likely to increase in the future as Kazakhstan's giant Kashagan field under the Caspian moves into production.

Kazakhstan's Caspian coastline has been the scene of a number of recent catastrophic events. In 2000, for example, more than 10,000 Caspain seals were estimated to have died here in what wildlife biologists term a "mass mortality event." In 2007, nearly 1,000 dead seals washed ashore in Kazakhstan. Smaller groupings (between 20 and 50) of dead seals have also littered Kazakhstan's shoreline in 2011 and 2012. The mass mortality event of 2000, representing nearly 10% of the total Caspian seal population, is thought to have been caused by a virus (canine distemper virus). Others speculate that pollution may have made the seals especially vulnerable to viral infections.

## Saiga Antelope

### Introduction

The Saiga antelope (*Saiga tatarica*) is a rather odd-looking ungulate naturally occurring in herds in the semiarid environs of Central Eurasia. Its distinctive over-sized nose warms inhaled air during frigid steppe winters and filters air during hot, dusty summers. The animal's historical range was once the entire Eurasian steppe, from Europe across China. Today, Saiga is limited globally to five distinct population clusters: one in Russia, one in Mongolia, and three in Kazakhstan. Some of these animals in Kazakhstan migrate into Turkmenistan and Uzbekistan during the winter months. The global population of Saiga antelope is estimated to be just under 300,000 individuals. The IUCN lists this specie as "Critically Endangered" a category one step shy of extinction in the wild. Kazakhstan can effectively be considered the last bastion of Saiga populations, heightening its importance for conservation and governance. It is estimated that up to 85% of global population of Saiga lives in Kazakhstan. The three distinct Saiga populations in Kazakhstan are the Ustyurt in western Kazakhstan, near the Ural river in the country's northwest, and the Betpak Dala population in Central Kazakhstan.

### The Issue

The primary threat to Saiga antelope today is hunting by humans. These animals are poached throughout their range, though particularly so in Kazakhstan. An important impetus for killing male saiga is the spiral, amber horns that are

highly sought after (worth at least $1,000 per kilogram) in traditional Chinese medicine (TCM). In 2013 4,500 horns, with an estimated value of $22 million, were seized by custom officials at the Chinese border with Kyrgyzstan. A slightly larger seizure occurred in the Almaty oblast in 2012. Saigas are also killed in Kazakhstan as a source of meat, a particular problem in relatively poorer rural areas. The opening up of the Chinese border added additional economic pressure on the beleaguered Saiga. After a decade of independence, Saiga populations had nearly been eradicated (decrease by up to 95%). Other threats to these animals include habitat fragmentation, as well as fencing, roads, and rail lines that interrupt migration routes. Poor management and a perceived overall lack of law enforcement threaten Kazakhstan's Saiga as well. Illustrating the inherent danger in the latter, in 2019 Yerlan Nurgaliev, a state conservation ranger, was killed by a group of poachers in the remote Kazakh steppe.

In 2015, a mass mortality event took place in Kazakhstan that garnered international media attention. More than 200,000 Saiga antelope dropped dead in a matter of days. These deaths represented more than half the global population, and nearly wiped out (just 15% survived) the Betpak Dala population in central Kazakhstan. Scientific research revealed the likely cause to be a commonly occurring bacteria *Pasteurella multocida* type B. Under normal circumstances this organism in the nose cavity of Saiga are not harmful, though a climatic anomaly of excessive heat and humidity proved catastrophic. Such climate change effects may appear more frequently moving forward into the future.

## Governance

The environmental issues in Kazakhstan described above have been targeted with a variety of governance efforts, with most necessitating some form of international cooperation. Since the late 1980s, the Aral Sea and its detrimental environmental and socioeconomic impacts have increasingly received global attention from mass media outlets, scholars, NGOs, international development agencies, and local and international governing bodies. Following the collapse of the USSR, Central Asian states immediately recognized the importance of joint management of the region's river basins including the Aral Sea. An offshoot of this was the formation of the International Fund for Saving the Aral Sea (IFAS) in 1993 by the presidents of the newly independent Central Asian states. The primary focus of this organization has been cooperative water management and ultimately the improvement of environmental and socioeconomic conditions in the Aral Sea region. The political will on the part of the Kazakhstan government was instrumental for the completion of the 2005 dam project. Officially termed the Syr Darya Control and Northern Aral Sea project, joint funding and implementation by Kazakhstan and the World Bank have resulted in stabilization of the Northern Aral Sea in Kazakhstan and resultant improvements in ecological and socioeconomic conditions.

As with the Northern Aral Sea case, policy responses to the nuclear testing legacy in Kazakhstan have been crucial. In 1992, the newly independent Kazakhstan government passed the law "on social protection of citizens suffered from nuclear tests in the Semipalatinsk nuclear test Polygon." Under this law nearly 1.1 million residents have been issued "radiation passports" that entitle them to monetary compensation and higher pensions. For children, free medical treatment is available, as are increased maternity leave times for mothers. Closing the Semipalatinsk nuclear test site and removing all nuclear weapons from the territory of Kazakhstan has been considered a major policy and geopolitical success. This achievement has raised Nursultan Nazarbayev to a prominent position as global leader in denuclearization. This and nuclear nonproliferation have been key components to Kazakhstan's foreign policy throughout its quarter century of independence.

Threatened wildlife species in Kazakhstan have also been targeted by a variety of governing initiatives. For the Snow Leopard, much of its habitat, blanketing mountain peaks, crosses

international political boundaries. The animals are very much a trans-boundary resource and as such effective management requires international cooperation and governance. Recognizing this, the first World Snow Leopard Forum was held in Bishkek, Kyrgyzstan, in 2013. This was the first ever gathering of state officials from the 12 snow leopard range states. In addition to high ranking government officials, this meeting also brought together representatives from World Bank, United Nations, conservation organizations, NGOs, academics, and journalists. Protection and conservation of the snow leopard was the focus of this gathering. One tangible result was the establishment of October 23 as International Snow Leopard Day.

Caspian Seal habitat also crosses international boundaries of the Caspian Sea, with management of its trans-boundary resources necessitating international governance. To this end, high-ranking officials from each bounding state met in 2018 and signed the Environment Impact Assessment Protocol under the Tehran Convention. With an overall goal of protecting Caspian natural resources, this treaty is the first environmental agreement of its kind in the region to date. Specifically dealing with the plight of the Caspian seal, Kazakhstan and other littoral governments in 2007 signed the Caspian Seal Conservation Action Plan (CSCAP). In 2010, the government of Kazakhstan agreed to pioneer efforts to develop Special Seal Protected Areas (SSPA) within its Caspian waters. To date, no such protected areas exist in the Caspian Sea.

For the Saiga Antelope, populations were managed sustainably, with numbers stable at around one million animals during the Soviet period. Following the 1991 collapse of the USSR, weak institutions plagued each of the Soviet successor states. In Kazakhstan, particularly in poverty-stricken rural areas, in a seminal multi-state agreement, the Saiga range states gathered in Almaty, Kazakhstan, in 2006 and signed a Memorandum of Understanding on the Conservation and Management of the Saiga Antelope. This and subsequent agreements have been organized by the United Nations Environment Program Convention on Migratory Species (CMS).

## Conclusion

A number of environmental issues, with varying degrees of global notoriety, continue to impact Kazakhstan today. Some of these issues are a legacy of the Soviet era and its unsustainable management practices and ideologically driven environmental abuse. The Aral Sea crisis and nuclear testing legacy are clear examples of this, while the situation with threatened wildlife seems more a product of post-independence governance challenges. As a newly independent state, governing priority in Kazakhstan has been nation and state-building, as well as economic and political stability. Kazakhstan and former president Nazarbayev can rightfully count as successful ending nuclear testing, closing the Semipalatinsk Nuclear Test Site, and subsequent disarmament and nuclear nonproliferation efforts. While stabilizing the Northern Aral Sea might be considered a modest success, this has engendered a strong sense of hope and optimism, emotions much needed in this region long under assault from environmental and socioeconomic crisis. International cooperation has been an important component of Kazakhstan's efforts to address its environmental issues, as has the assistance of global governance institutions like the World Bank and United Nations. As the Republic of Kazakhstan and its governance structures mature, sustainable development success may require a somewhat higher priority given to environmental concerns.

# Environmental Nonprofit Organizations

Rachel Emas
School of Public Affairs and Administration, Rutgers University-Newark, Newark, NJ, USA

## Synonyms

Environmental nongovernmental organizations (environmental NGOs); Environmental organizations

## Definition

Environmental nonprofit organizations are groups outside of government and the commercial sector whose objectives and actions are rooted in and motivated by environmental, sustainability, wildlife, wilderness, nature, and biodiversity management, lobbying, research, advocacy, conservation and/or preservation efforts and aims.

## Introduction

Environmental nonprofit organizations (environmental NPOs), which are most often referred to as environmental nongovernmental organizations (environmental NGOs), are groups operating outside of government and the private sector whose objectives and actions are rooted in and driven by various environmental aims such as sustainability, wildlife and wilderness conservation, biodiversity management, research, lobbying and advocacy, natural resource preservation, and recreation.

Governmental institutions are traditionally organized into sectoral agencies and departments. This works reasonably well until the system encounters a challenge that is multifaceted, complex, and comprehensive, such as the major environmental and natural resource problems. Environmental nonprofit organizations, acting outside of formal state and governmental processes, are positioned to drive awareness and leverage change across sectors, levels of governments, geographies, nations, and groups of people in order to address these difficult dilemmas. Environmental NPOs play an increasingly vital role in advocacy, lobbying, negotiating, and monitoring environmental policies and agreements. Thus, it is important to evaluate these types of nonprofit organizations. This entry will first review the common characteristics, activities, and roles of environmental NPOs. Then, the history and evolution of these organizations will be considered. Finally, the entry ends with a discussion on the current state of environmental nonprofit organizations in the world today.

## Characteristics of and Characterizing Environmental Nonprofit Organizations

Environmental nonprofit organizations can be characterized in several ways. For example,

environmental NPOs can be identified according to the issue to be addressed, organizational features, and the level at which they function. One common mechanism used is to delineate these environmental nonprofit groups by the environmental issue which they seek to address, such as animal rights, resource conservation, deep ecology, environmental health, resource preservation, wildlife management, or environmental justice, to name a few. Then, environmental NPOs can be further considered according to their focus with respect to a particular environmental issue such as specific geographical area, natural resource, species, habitat, or population group.

These environmental nonprofit groups may be characterized with respect to their formal (legal) organizational structures, which influence resource acquisition and distribution, governance, and stakeholder composition. ENPOs are frequently financed by some combination of individual donations, bequests or endowments, government grants or contracts, corporate sponsorships, fees for goods or services, foundation grants, or other institutional sources of capital. As with all such nonprofit organizations, the amount and range of funding sources varies considerably for environmental groups.

The management and governance of an environmental nonprofit organization, like other NPOs, is highly dependent on the organization's legal status and the composition of its stakeholders. The nation of origin of each ENGO establishes the legal structure, status, and constraints that govern the actions and activities of the organization. Depending on these conditions and contexts, environmental organizations may be composed of volunteers, professional staff, executive director, director general, boards of directors or trustees, etc., or a combination thereof.

As with other nonprofit organizations, many environmental NPOs choose to rely on a mixture of paid professional staff and volunteers. In the governance model common to nonprofit organizations in the United States, the staff are responsible for the delivery of goods and/or services to the target population. These staff members are managed by the executive director, who is employed directly by the board of directors. The executive director is tasked with staff management, program development, daily operations, and communication with the board. Composed of unpaid individuals, the board of directors is responsible for establishing the organizational mission, policies, and oversight, and maintaining connections with the community.

One type of organizational structure commonly employed by environmental nonprofits is by forming a national level organization that serves as an umbrella organization for local chapters. The local affiliated groups each work separately in their jurisdiction towards the same goal, with the national organization establishing mission-related priorities, coordinating efforts, mobilizing resources, and communicating between groups as needed. Increasingly, environmental NPOs engage in collaborative efforts to effect mission. Thus, organizational structures often include those mechanisms that facilitate collaborations and networks of several major environmental organizations with similar objectives. As with individual organizations, these coalitions may differ in their degree of formality, timetable, and structure. These environmental networks are created in order to pool and leverage resources and political influence for greater impact on the specific policy issues they have in common. Finally, environmental nonprofit organizations may select a simpler organizational structure without the use of a network, coalition, or collaboration if this aligns with the goals of the group.

Environmental organizations may also be grouped by the level at which the organization participates, operates, and engages in activities, such as the local, state, national, regional, multinational, and international levels. At the international level, the extensive list of environmental NPOs includes the Environmental Defense Fund, an environmental advocacy group which works on issues such as climate change and energy, marine and ocean ecosystems, and land use. Other international environmental NPO include the Forest Stewardship Council, which establishes standards, certifications, and labels for forest products, and the World Resources Institute, whose work is focused on sustainable management of natural resources. Examples of

environmental nonprofits that operate and address concerns at the regional level include the Environmental Foundation for Africa, European Wildlife, among others.

At the international, national, and local levels, there are tens of thousands of environmental organizations throughout the world, serving a variety of objectives but often undertaking similar actions, which are addressed in the following segment. The next section outlines the common tasks, activities, and roles of these nonprofit organizations in the sphere of environmental governance.

## Activities and Roles of Environmental Nonprofit Organizations

Environmental nonprofit organizational monitor the state of environmental conditions, issues, and public policy. Environmental nonprofit organizations are highly visible in the public sphere, shaping public awareness and decision making at all levels of government and across the globe. Through direct or indirect actions, environmental NPOs have helped to bring to the public's attention environmental challenges and dilemmas to be addressed, such as the conservation of endangered species, global warming, and climate change.

Key activities performed by environmental NPOs include their participation in the traditional policymaking phases of issue identification and agenda setting through the organizations' support for and promotion of public awareness on environmental issues. Activities to promote increased awareness are oftentimes coupled with the organizations' advocacy for specific environment-related policies, as well as their support for environmental justice and equity more generally. This section will further discuss key activities undertaken by environmental NPOs and explain the role served by these groups.

Towards issue identification and agenda setting, environmental nonprofit organizations undertake stakeholder engagement, advocacy, negotiation, and consensus building throughout the policy process. In doing so, environmental NPOs perform activities central to all stages of policymaking, including policy formation, development, implementation, assessment, and revision. Due to the expertise of these environmental nonprofit groups and their nonpartisan, nongovernmental status, environmental NPOs often take part in the evaluation of environmental conditions, monitoring of enforcement and compliance efforts, and the collection, analysis, and dissemination of data, information, and research.

One of the most important contributions of environmental nonprofit organizations is to raise and strengthen public awareness and acknowledgement of environmental and natural resource concerns. The grassroots nature of many environmental organizations lends itself to local efforts to alter behavior. Therefore, government agencies and environmental NPOs frequently collaborate in the management of environmental activities, projects, and programs. For instance, several agencies of the US federal government worked closely with the organization Nature Conservancy during the development of plans for habitat conservation for the Endangered Species Act. This collaboration allowed the federal government to address difficult matters despite formal organizational constraints, while providing the Nature Conservancy heightened influence and legitimacy in the environmental governance stage.

Environmental nonprofit organizations help to democratize decision-making efforts as a result of their engagement with citizens and stakeholders, especially population groups that are often underrepresented in the policy process. Education and advocacy efforts by environmental NPOs have the potential to engage citizens and place important environmental concerns on the public agenda. A few examples of how they accomplish these goals are through the creation and dissemination of environmental impact statements, organizing town halls or informational forums, and serving as an outlet for information and communication regarding important environmental issues. The goal is for stakeholders and citizens to become more knowledgeable about and engaged in critical decision-making endeavors related to the environment.

Environmental NPOs also confront environmental justice issues as a result of environmental

hazards and natural resource challenges, which disproportionately impact marginalized groups. Within the realm of environmental organizations, there is a subfield of environmental justice groups that address the fair treatment and meaningful participation of all stakeholders in policy development, implementation, and enforcement. Environmental justice organizations seek to provide equal access to the decision-making processes to promote a healthy environment for all, especially those populations often left out of or underrepresented in these measures. In doing so, they offer a platform and participation vehicle for groups who are vulnerable to environmental hazards or resource challenges. Cultivating engagement of marginalized peoples may also serve to encourage more sustained, broad-based public participation by citizens in other policy areas.

Another significant role of environmental NPOs is in addressing the transboundary, interdependent, and complex nature of many modern global environmental challenges, like sustainable development and climate change. One way environmental NPOs help is by monitoring and assessing the implementation of international commitments, serving as an impartial and nonpartisan watchdog and source of scientific information. These nonprofit groups can also provide expertise and advice on highly technical matters of environmental policy to government officials and key decision makers. The complexity of international environmental agreements between many sovereign nations presents environmental NPOs with the opportunity to aid research and the flow of information between a diverse set of policy actors. For instance, the United Nations Commission on Sustainable Development has implemented innovative formats for organizational collaboration, such as multi-stakeholder dialogue sessions, a partnership fair, and a series of sessions specifically for major groups like nonprofit environmental organizations (United Nations Non-Governmental Liaison Service 2007). These interactive and cooperative mechanisms offer unique opportunities for nonprofit organizations to disseminate information and facilitate cooperation across governmental levels and boundaries.

Environmental NPOs undertake many activities that influence the decision-making processes at all levels even though they lack formal public policymaking authority. Environmental nonprofit organizations continue to play an increasingly important role through their efforts to increase public awareness, engage citizens, enhance transparency, negotiate and monitor intergovernmental agreements, and provide scientific expertise on complex topics.

The following section reviews how these activities of environmental NPOs have initiated, supported, and leveraged environmental movements over time in order to increase awareness and influence policies and decisions.

## Evolution of the Role of Environmental Nonprofit Organizations

There is a long history of groups dedicated to protecting and conserving the environment and natural resources in nations and neighborhoods around the world. Critical moments for and intensification of many national environmental movements are often the result of decades of effort by these organizations, consistently working at the grassroots level to increase awareness about specific environmental issues. This section presents examples of organizations in several countries whose work prompted the passage of national or international environmental protection and conservation policies.

The Commons, Open Spaces, and Footpaths Preservation Society of Great Britain was founded in 1865 and is one of the earliest environmental NPOs in Europe. This group was followed by the founding of four other NPOs in the United Kingdom over the next 20 years, all of which addressed the protection of birds and clean air. In 1891, one of these four groups, now known as the Royal Society for the Protection of Birds was established to protest the use of plumage in the making of clothing and accessories. British middle-class women joined the movement in large numbers, and, only 15 years after its formation, the society achieved its first success with the passage of the Prohibition of the Importation of Plumage in

1921. The efforts of this environmental NPO built on the work of earlier preservation groups and encourage public policies on the protection of the environment by demonstrating the necessity of government intervention in preserving and conserving natural resources and wildlife (McCormick 1989).

The Natal Game Protection Society was founded in South Africa in August of 1883 as the nation's first wildlife conservation body amidst the rising popularity of hunting and resultant diminishing natural resources in the wake of European settlement. The Society pressed for the formal establishment of protected game reserves. Four game reserve areas were established by the government in 1897 partly in response to the Society's efforts (Hurrell and Kingsbury 1992).

Sri Lanka was similarly suffering from the declining game populations and, thus, the Ceylon Game Protection Society was established in May 1894. At the second meeting of the organization that now called the Wildlife and Nature Protection Society of Sri Lanka, the group required all members to ensure that the provisions of the local gaming ordinances were enforced in their districts. This early environmental NPO was directly involved in the monitoring and enforcement of local gaming, hunting, and poaching policies (McCormick 1989).

In the United States, the roots of the environmental preservation movement can be traced to the early work of activists and organizations that began in the late nineteenth century in an effort to promote efficient use of natural resources. With this rise in environmental awareness, the Sierra Club was founded in 1892 and Audubon Society in 1905. These organizations were created in response to a specific environmental challenge or crisis. For instance, the Audubon Society was formed in reaction to the slaughter of millions of birds for commercial trade (Hurrell and Kingsbury 1992).

Generally, environmental organizations operated diligently with small membership numbers until the rise of the modern environmental movement of the mid- to late-twentieth century. Coinciding with the broader civil rights movement, concern in the US over nuclear energy, pollution, and diminishing natural resources, strengthened the memberships, financial support, and influence of environmental groups. For instance, the Sierra Club had about 7,000 members in 1950, but this grew to 10,000 by 1956 and 15,000 in 1960 (Cohen 1988). Growing public awareness of environmental issues was also due in large part to the decades of continuous and consistent work of dedicated environmental nonprofit groups focused on drawing attention to critical environmental concerns (Hurrell and Kingsbury 1992).

The modern environmental movement came to the fore in the 1960s and 1970s, placing environmental issues on national agendas. In 1970, the first Earth Day, now a global event that began in the United States, was celebrated by 20 million Americans, bringing together a wide swath of groups and individuals in a rare political alignment. By the end of that year, the United States had created the Environmental Protection Agency. Environmental NPOs were key stakeholders in the rise of environmentalism onto the main stage of national and international politics and policy in the mid-twentieth century.

At the international level, the United Nations Economic and Social Council established the Committee on Non-Governmental Organizations (called the NGO Committee) in 1946 to acknowledge the importance of these groups and include them in discussions and debates at the international level. In 1972, the United Nations hosted the first Conference on Environment and Development in Stockholm, which led to the creation of the United Nations Environment Program (UNEP). The creation of the UNEP further legitimized the work of environmental organizations and helped to formalize their role in environmental policymaking. In the 1992 UN Earth Summit, which is also called the Rio Conference as it was held in Rio de Janeiro, Brazil, over 9000 governmental, private, and nonprofit organizations from 171 nations came together to debate and discuss environmental progress and problems (United Nations Economic and Social Council 1997).

The UNEP global forum produced Agenda 21 and the Rio Declaration, which called on all stakeholders to take action towards more balanced and sustainable development at all levels of

government and across all sectors and geographies. Principle 10 of the Rio Declaration calls upon governments to work with citizens and organizations to improve and increase public participation, access to information, and access to justice in environmental matters. Agenda 21 is particularly significant for its endorsement of the role of environmental NPOs in shaping environmental policy. Section three of Agenda 21, Principle 27 addresses strengthening the role of nongovernmental organizations and acknowledges the critical role of NGOs in the shaping and implementation of participatory democracy. A specific objective of Agenda 21 is the development of mechanisms that support and enable environmental NPOs to effectively engage citizens in public debate, policy development, and implementation processes.

At the 1992 Rio Conference, tens of thousands of nonprofit organizations also called for the creation of an official open-ended NGO working group. Four years later, the United Nations established just that, and outlined specific principles for consultative relationships with these organizations. In these consultative relationships with the United Nations, organizations may propose items for meeting agendas, attend and present at meetings, offer written statements on specific items, and perform special studies on scientific issues. Previously reserved for member states, the authorization of these important activities enhances the value of these organizations in the various stages of decision making.

Since the establishment of these more formalized relationships with the United Nations, environmental NPOs have been increasingly active in major environmental conferences, summits, headings, negotiations, and dialogues at the international level. Some international commissions have gone even further to recognize and respect NPOs as formal stakeholders in these events, such as the NGO Representatives on the Major Groups Facilitating Committee of the United Nations Environment Program.

As the world has become increasingly globalized over the past several decades, the size and scale of environmental nonprofit organizations has also grown. The swift development of the field of environmental organizations is partly a reflection of the growing awareness of the depth, breadth, scale, and scope of environmental problems, and the limited capacity of traditional governmental institutions to address these challenges alone. The following section will detail contemporary developments in the field of environmental NPOs.

## Twenty-First Century Challenges and Environmental Nonprofit Organizations

The evolution of environmental nonprofit organizations has progressed rapidly in the last century, and environmental NPOs are increasingly influential in today's diverse and globalized world. Technological advancements have made science and data a prominent driver for policymaking and analysis and elevated the role of expert-based environmental NPOs. Much of the expertise, empirical research, and scientific knowledge of environmental issues is generated by the work of these nonprofit organizations.

Modern environmental challenges are often complex, interconnected, and transboundary. The issue of climate change, for instance, has already created widespread impacts for individuals, groups, and nations throughout the world with regard to water, energy, transportation, agriculture, ecosystems, healthcare, and national security. These environmental problems are not constrained by political, geographical, or other manmade boundaries. Thus, the independent actions of sovereign governments may not be sufficient to adequately address these issues. This concept that organizations can overcome some of the constraints faced by national governments has found increasing acceptance in the international community, especially regarding specific environmental challenges like climate change and sustainable development.

Environmental NPOs' expertise in environmental matters is especially critical in addressing complicated matters that require consultation. The expert knowledge of ENPOs can be a valuable resource in the development, implementation, and monitoring of environmental policy. The emphasis on data-driven decision making is an effort to confront dynamic, comprehensive,

and complex challenges of the environment, and environmental nonprofit organizations are often sought out as resources for scientific expertise. Following Agenda 21, for instance, the United Kingdom developed the following three bodies for broader consultation: (1) the British Government Panel on Sustainable Development, which is composed of environmental experts and scientists, (2) the United Kingdom Round Table on Sustainable Development, which includes nonprofit organization representatives and academics (3). the Citizen's Environment Initiative, whose members are experts in the environmental and political arenas (Eden 1996).

In the face of complex global natural resource and ecological dilemmas, environmental NPOs have helped to monitor stakeholder commitments; enable communication and collaboration between government, businesses, and citizens; and provide knowledge and expertise to government officials and key decision makers. With the growth in complexity of the environmental challenges of the modern world, these environmental nonprofit groups acknowledge and appreciate the need to collaborate and work together to achieve progress on today's most pressing problems. Environmental nonprofit organizations are poised to play an ever-important role in confronting these difficult problems. However, to be effective partners the role of these groups must be acknowledged and respected by formal state actors and policymakers. Both organizations and nations must recognize that they need to work together in order to tackle the complex environmental problems of the twenty-first century.

## Conclusion: Importance of Environmental NPOs in Shaping Policy

Environmental NPOs play a significant role in shaping policy through research, public awareness and education, monitoring environmental conditions, and advocacy. As environmental NPOs are not formal public agencies, these groups have flexibility in their methods used to increase awareness and advocate for issues of importance. The grassroots nature of many of these organizations also lends itself to increased effectiveness with local populations and improved citizen engagement. Those environmental organizations which rely on voluntary memberships are especially well-suited to influence the local citizenry with whom they have a history of trust, legitimacy, and respect (Rosenbaum 2017).

Many modern environmental concerns are transboundary and highly complex. Thus, environmental nonprofit organizations serve an increasingly vital role in the negotiation and monitoring of international agreements to combat these intricate challenges. Environmental nonprofit organizations help to promote public awareness, monitor public and private sector activities, research program and policy impacts, disseminate information, and advocate for environmental causes. Environmental NPOs are invaluable to society, serving as mediating bodies that make the complex structure of relationships among stakeholders more interconnected and adaptable to changes in the broader environment.

As environmental challenges continue to grow in significance, scope, and scale, environmental nonprofit organizations will increasingly be called upon to perform. Environmental nonprofit work to galvanize public awareness and support, advocate for equity and justice, evaluate and assess environmental threats, and collaborate with other stakeholders to produce positive change.

This entry first reviewed the common typologies and categorizations of these groups. Second, it outlined the activities and roles of environmental nonprofit organizations. Then, the history and evolution of these organizations was presented. Finally, the entry ended with a discussion on the current state of environmental NPOs in the world today. From this discussion, it is evident that environmental nonprofit organizations have played a crucial role in the formulation and governance of environmental policy. Environmental NPOs will continue to play a significant part in aspects of environmental decision making, implementation, and governance.

## Synonyms

Environmental governance; Government instruments

## Definition

Environmental public policy is a government action to guide and regulate a sector or a region, regarding the use of natural resources and the quality of the environment.

## Introduction

Environmental policy in Latin America has been evolving to include the region's diversity and better cope with the different and more complex problems faced. Most countries are highly urbanized – Brazil, Argentina, and Uruguay exceed 90% of urban population – and almost all countries are above the world average of 52%. A common characteristic of Latin American countries is their natural resource abundance as well as their economic dependence upon primary exports. The region has an important part of the world's tropical forest, freshwater, and cultivable land as well as mineral resource reserves. Consequently, there are two main areas of environmental policy concern: environmental quality, in particular air and water pollution relating to urbanization and mining, and resource management of renewable and nonrenewable resources.

Environmental concerns however cannot be separated from contextual factors. Policy themes such as development, poverty, and inequality have been strongly related to environmental issues. Despite the "blessing" of significant natural resources, the benefits of its exploitation do not reach most inhabitants. Currently income per capita in the region varies from USD 1720 in Haiti to USD 19,300 and USD 21,030 in Panama and Chile, respectively. Poverty as percentage of total population ranges from 11.1% in Brazil to 61.9% in Honduras, and in most nations of the region is well over 25%. High inequality as measured by the Gini index is prevalent in the region. Political instability and swings from nationalization to privatization are prevalent in the region. In this context, the process to develop environmental policies has included both the need to generate enabling conditions for these policies and the development of specific policy instruments.

To better understand environmental policy development in Latin America, this article is organized loosely around three different epochs: pre-1990, the 1990s, and the 2000s. The following three sections give an account of each policy stage by discussing main policies' focus, most common environmental problems subject to policy action, and preferred policy instruments. Discussion is illustrated with examples from different countries. The final section concludes and presents some important challenges for the near future in the region.

## Before the 1990s: Technocratic Fixing and Command and Control Instruments

Although there are examples of environmental regulation in Latin America in the early twentieth century – i.e., norms for the quality of drinking water dating from the 1930s and for industrial drains disposal – most countries of the region begin applying norms and standards in the 1960s. Up to 1990, what can be found are diverse and disconnected regulations, aimed basically at protecting public health from potential hazards (e.g., source-specific emission limits, product specifications, and waste disposal regulations) and the use of common pool resources, such as water, coastal zones, fishery zones, and forests.

Discussion on environmental policy in Latin America was mainly referred to economic development and dependency theory. In the political arena, between the end of the 1950s and beginning of the 1980s, nationalization of various natural resources such as oil and copper as well as reforming land tenure programs spread through many Latin American countries (Mexico, Peru, Chile, Brazil, Argentina), following more general antiforeign sentiments (Chua 1995, p. 239). Ideas about development and environment were controversial, crossed by tension on understanding the relationship between the so-called "first" and "third" worlds where the industrialized countries' call for stopping an environmental crisis could limit developing possibilities for unindustrialized countries (Estenssoro 2014). Most studies relating to natural resources availability were static and partial; they did not look at the ecosystems from a dynamic and interrelated perspective which could help in understanding its interactions with anthropic activities (Sunkel 1981). ECLAC developed an environmental program promoting development paths which could be particular to each country's reality and could harmonize social, economic, and environmental dimensions (Sunkel 1981).

However, in the 1980s a common feature in many Latin American countries was the presence of authoritarian regimes and the installation of market-driven models of development where economic growth was put center stage. In this context environmental concerns were considered issues that should not limit growth and that could be fixed after they occurred. As a result, many of these concerns were channeled basically through fringe nongovernmental organizations (NGOs), usually financed by international foundations. In most countries a new privatization cycle initiated in this period resulted in many of the natural resources moving back, at least partially, into private hands, for example, oil in Mexico, mining and oil in Peru, and mining in Chile.

Environmental quality problems were understood as relatively simple requiring technical or management solutions. When a problem was evident, following a technocratic approach, public authorities identified the "problem" and sought expert advice to propose the "solution." Environmental concerns were basically an issue of state concern if they imposed a large risk, and action was undertaken reactively as problems appeared. There was no specific environmental institutionality, and environmental problems were dealt with by the affected sector, for example, the Health Ministry, setting water or air quality standards.

In line with this approach, in the initial stages of environmental policy making, the most common policy measures were direct regulations, also called command and control instruments, such as prohibitions, technology mandates, and performance standards. Reliance on command and control instruments assumed that the regulator had the capacity required to design and to apply the instrument. Environmental problems where experience

from other more developed countries could be easily transferred and/or where solutions were relatively straightforward were amenable to such an approach.

## The 1990s: Global Drivers, Increasing Complexity, and Economic Instruments

During the 1990s, increasing state involvement, important international pressures, and a more proactive approach to environmental policy making are observed. Most Latin American countries moved from dictatorial regimes to democracies and had to deal with their legacy: market-oriented restructuring of productive sectors, a weak state, social relations affected by the strengthening of elites, and greater presence of transnational companies (Castro et al. 2015). Democracy brought with it the need to develop their own paths and respond to more complex systemic environmental concerns such as land and forest degradation, atmospheric pollution, and urban and industrial waste, which affected large populations and diverse interests. Biodiversity and freshwater access were identified as increasingly important issues (UNEP 1997). This increased both the breadth and depth of required environmental policies.

Most Latin American countries had opened their economies and increased their international trade. Some opted in this period for intensifying their global market orientation by subscribing international trade agreements, for example, the North American Free Trade Agreement (NAFTA), which included environmental restrictions from developed partners that feared a "race to the bottom," i.e., that developing countries would compete unfairly through more relaxed environmental standards. These agreements thus became drivers for policy design and implementation.

The 1992 United Nations Conference on Environment and Development in Rio de Janeiro, Brazil, also known as the Earth Summit or Rio Conference promoted the importance of advancing in developing environmental policy and institutions, as well as fostered awareness on new topics such as climate change (supported also by the IPCC 1990 Report) and biodiversity loss.

Whereas in the past, more state involvement was seen with skepticism by firms, many of these changes – especially clear rules – were supported by export-oriented sectors that recognized that external markets were now requiring better environmental stewardship, including both products and production processes.

Consequently in the 1990s, the internal democratic context and the external driving forces coming from international trade and global environmental treaties called for a new approach to environmental policy in Latin America. There was a transformation from a disparity of norms into bodies of policy issued by dedicated environmental institutions (UNEP 1997). For example, in 1992 Chile issued its Law for the Environment (Ley de Bases del Medio Ambiente), which collected all norms and regulations from different sectors into a body of law under a policy directed at fulfilling international commitments and organizing what was already in place; Honduras promulgated in 1993 the General Law of the Environment, which established a State Secretariat in the Department of Environment. Most countries in Latin America implemented regulations on air, water, and emission standards and required environmental impact assessments of large investment projects (UNEP 1997).

Environmental institutions were developed and political positioning of the issue gained prominence. The new generation of state bodies included the Secretariat of Environment, Natural Resources and Fisheries (SEMARNAP) in Mexico, the Ministry of Sustainable Development and Environment in Bolivia, the Secretariat of Natural Resources and Human Environment (SERNAH) in Argentina, and the National Commissions for the Environment (CONAMA) in Chile and Guatemala (UNEP 1997). Efforts and resources from international institutions such as the World Bank, United Nations, and Regional Banks supported this trend (UNEP 1997).

New approaches to conservation and biodiversity protection were developed, for example, in Costa Rica a scheme to promote forest conservations by compensating forest owners for the

environmental services their forests provide to society (UNEP 2002). Other initiatives included land-use planning and establishment of protected areas, such as the Program to Conserve the Brazilian Rainforest with funding from the G-7 nations (UNEP 2002). Specific programs and regulations on biodiversity protection included Brazil's National Program on Biological Diversity (PROBIO) that started in 1994, together with identification of priority conservation areas and actions; Peruvian law on biodiversity conservation and sustainable use entered into force in 1997 (UNEP 2002).

New institutions, better policy frameworks, and specific preemptive instruments aimed at avoiding environmental degradation signal a switch toward a more proactive – instead of reactive – environmental policy. This required increasing the array of policy instruments adding to the more traditional command and control instruments. Following the more general political trend of maintaining private sector initiative and control imposed in the 1980s, economic or market-based approaches were pushed strongly, again in many cases by international development banks and organizations. These policy instruments use financial means, monetary and near-monetary rewards, to guide polluters' behavior toward reducing risks posed by their economic activities (NCEE 2001). The most popular market-based instruments are pollution charges (fees or taxes) and tradable permits; there are also positive schemes such as subsidies and tax exemptions.

These instruments were seen as flexible and well fit to improve economic efficiency and corresponded to an international trend resulting from strong critiques to the simplistic policy practices of command and control. It was argued that economic instruments had advantages over direct regulations for achieving results at lower cost, being more effective at controlling large numbers of small sources, and fostering technological innovation. By the 2000s many Latin American countries had experimented with these instruments. For example, Acquatella (2001, 2009) and Acquatella and Barcena (2005) report, based on a survey of 13 countries, that up to 2002, 55 instruments had been implemented: 7 subsidies, 11 tax credits, 4 preferential financing, 2 fiscal transfers, 21 charges, 3 tradable permit schemes, 3 deposit refund systems, and 4 certification schemes. Specific examples are:

- Brazilian taxes on merchandise services, where part of tax collection is allocated to the local government to cover for environmental expenses
- Use of Environmental Services Payment in Costa Rica to compensate for opportunity costs of forest conservation and provision of hydrological and other services and benefits
- Colombia tax benefit for environmental management and investment, tax exception, and deduction, for Rio Negro water management
- In Chile two tradable permit schemes: tradable fishing quotas and a compensation system for fixed source particulate matter in the capital city of Santiago

An important disadvantage of economic instruments relates to the technical difficulties in their implementation and acceptability. According to Acquatella (2009), implementation difficulties are a major obstacle for the use of market-based instruments in Latin America due to the difficulty to integrate environmental policy into the different levels of the state administration (municipalities, regional and national governments) and to harmonize with other tax and funding mechanisms. In fact, of the 55 instruments discussed above, only 32 were operating, and of these many not as expected. Most were positive schemes, i.e., required government support or outlays.

## The 2000s: Complex Governance Including Information, Conflicts, and Participation

In the 2000s, new instruments and issues emerged. Direct regulation has kept its place for dealing with well-defined problems where there is wide consensus on the need for regulation and enough information. Economic instruments have

been gaining ground as a tool for policy makers. For example, as the world moves to mitigating greenhouse gas emissions, taxes, compensation mechanisms, and tradable permits are being implemented, in Mexico, Chile, and Colombia. However, the increased depth and breadth of environmental policy in Latin America that includes both environmental quality concerns and natural resource management, at the global, regional, and local scales, has resulted in the need to develop enabling conditions and new instruments to support policy and institutional frameworks.

Table 1 presents some case studies that underscore critical factors for improved environmental governance. Reliable and timely information and the benefits of incorporating indigenous/local knowledge are important. Environmental information requires easily understood, policy relevant, and participatively designed indicators. This is key to improve both the definition of instruments as well as monitoring and enforcement. Environmental education is required to increase awareness and give people a greater sense of responsibility. Citizen participation in environmental legislation and project appraisals, though used since the 1990s, is weak and continues to be a challenge.

Economic valuation – putting a value on environmental externalities – has also become a more important tool. In some cases, allowing weighing costs and benefits of environmental protection as in the case of Chile where a manual with specific methodologies to put values on economic and social impacts of improved air quality – particularly in health – has been developed for practitioners (Guía Metodológica Para la Elaboración de un Análisis General de Impacto Económico y Social (AGIES) para Instrumentos de Gestión de Calidad del Aire). In other cases, establishing the payments for certain environmental services or values so that their loss can be weighed against the benefits of developing a given project has also been developed.

In this period, it has become clear that there is a need for firms, working together with the state, to go beyond what is required by formal regulations, because in the near future regulations will be required and this will help their development or because markets are demanding this. These voluntary approaches by firms include:

1. Unilateral commitments such as environmental management schemes with certifications or corporate social responsibility, for example, product labeling informing energy efficiency of domestic electronic is used in Chile, with the aim of guiding consumers' choices to reducing energy consumption
2. Public voluntary schemes where participating firms agree on standards developed with regulatory agencies, for example, cleaner production Programs in Chile and Mexico
3. Incentives for clean production, through contests that improve the reputation of firms with better performance or voluntary environmental information disclosure

The state must play an important role supporting the development of these initiatives.

Finally, an important development in this period is that large investment projects are increasingly being contested by civil society articulated against their socio-environmental costs. The Environmental Justice Atlas reported 20 environmentally related conflicts between 1980 and 1990, a figure that more than doubled in the following decade with 58 disputes. The number of cases increased dramatically during the first 10 years of this millennium to 207, most after 2005 (EJOLT 2015), particularly those regarding policy making in environmental domains, such as the use of the territory, access to water, and installation of productive enterprises in communal territories which may see their way of life affected by intruders (Castro et al. 2015). These conflicts arise relating to competing uses of a specific resource, the unequal distribution of the costs and benefits of projects, in particular local communities receiving the costs and not seeing the benefits of projects located in their lands, and differences in values between project proponents and affected communities. Increased corporate social responsibility, better public participation, and cosmetic changes to projects are not enough to resolve disputes over investment projects. The need for a better understanding of the complexity of issues involved and

| (I) | **A manual for fighting environmental crimes**<br>Peru | In Peru, the Manual for Investigating Environmental Crimes has been developed as a tool for obligatory use by environmental prosecutors. It is intended to guide investigation and punishment of environmental crimes in the Peruvian Amazon and other key ecosystems, as well as to bring greater coherence to approaches aimed at environmental crime prevention (Avina 2011) |
| (J) | **Environmental justice in practice: the** *Mendoza Case*<br>Argentina | Positive steps were made in resolving a decades-old pollution problem in the Rlachuelo watershed of Buenos Aires with the ruling adopted by the Supreme Court of Argentina in the Mendoza case. Residents sued the federal government for damage to their health, resulting in a ruling that held the City of Buenos Aires and the federal government responsible for the damage to and reparation of the watershed, and the setting up of an authority to address the environmental health issues. This authority has embarked on a range of clean-up and restoration efforts (Staveland-Saeter 2011; di Filippo 2000) |

Ref: (UNEP 2012, Table 12.1)

the needs of stakeholders is key. Full stakeholder participation in decisions is required, including networking and negotiation between key actors to design and implement sustainable development plans. For example, co-management of protected areas and watersheds by local communities and even the private sector has been adopted in biodiversity conservation and forest management. Much progress is also required in environmental justice, i.e., the fair treatment and meaningful involvement of all people in the development, implementation, and enforcement of environmental laws and policies.

## Conclusions and Challenges

Environmental policy in Latin America has been steadily evolving in the last 40 years. Before the 1990s it can be characterized as basically reactive to problems, i.e., technical solutions proposed by experts were applied as problems became evident, basically relating to water quality and also air pollution. Academic circles discussed about the need to ensure that natural resources be used for development purposes, but authoritarian governments imposed privatization of most resources, and the need to ensure that environmental concerns did not hamper economic growth. The state was the basic actor in this stage establishing standards only when required and ensuring that the private sector could exploit resources without major contestation. Most Latin American countries had isolated norms and regulations for services related to natural resources and productive use of common pools, as well as other regulations aimed at avoiding acute environmental risks. Those policy instruments – developed sectorally – were directed to structured problems and had the logic of command and control.

During the 1990s, this dispersed regulatory approach was slowly reviewed and reorganized into more comprehensive policy frameworks. Pushed by increasing concerns relating to air and water pollution, democratic reforms that required responding to environmental concerns, and the fact that several countries in the region subscribed trade agreements that included environmental

provisions, a more comprehensive and proactive approach to environmental quality concerns is observed. Loss of biodiversity and land degradation gain prominence after the Rio Earth Summit in 1992. Preventive instruments – most importantly environmental impact assessments of large projects – and comprehensive laws are introduced, and environmental institutions developed, giving place to proper environmental policies. Though many regulatory instruments are still in command and control, there is a push to introduce economic instruments to allow flexibility and reduce compliance costs. Additionally, some foreign markets begin to react to environmental concerns and start to require that Latin American exporting firms improve processes and products, even if this is not required by state-mandated regulations.

In the 2000s social concerns creep back into environmental policy making. This completes a new playing field where firms are required to respond to stricter state regulations, market values, and community interests. Market-based instruments are being used to complement standards. Regulators are becoming more sophisticated including in an increasing number of cases the need to put a monetary value on the lost benefits associated to a particular project or policy. External markets are requiring better environmental stewardship by firms, and voluntary schemes are being implemented to advance pollution control. The installation of an investment project in a given territory is seen many times as a threat, rather than an opportunity. Increasing number of conflicts and opposition to new projects have been observed for many different reasons. Usual mitigation and compensation measures are not enough to make projects acceptable to affected communities. Firms and regulators are thus having to change their approach to the development of projects and consider how to better manage the different motivations to oppose investment projects: trade-offs between sectors, NIMBY, and values. This is particularly true for mining projects; however energy projects and others have also been affected.

The increasing complexity of environmental policy making is not a fad, but can be expected to grow. The need to reduce global warming and loss of biodiversity, concerns by more and better informed consumers about social and environmental impacts of their decisions, and increased stakeholder involvement and information, strengthened by better connectivity, will all push in this direction. Greener growth and sustainable development, low carbon and resilient cities, mitigation of greenhouse gases, and adaptation to climate change, among other drivers, will require moving from the discussion of specific instruments toward the development of adequate environmental governance structures. This is a challenge but also an important opportunity for Latin American countries.

## Pollution Problems Before and During the Period of High Economic Growth

Compared to other policy areas such as economics and finance, environmental policy is relatively new. Wide-ranging, the field of environmental policy spans from local garbage disposal to environmental protection on a global level. The Environment Agency was established within the Japanese government for matters concerning environmental policy after the country began to face significant pollution problems during the period of high economic growth (1955–1973).

Due to rapid modernization and the promotion of industry following the Meiji Restoration, pollution problems had existed even before World War II. One such example is the famous Ashio copper mine pollution incident. However, before the war, national policies heavily emphasized the expansion of manufacturing and military performance rather than environmental protection and environmental policy, which only helped ameliorate severe pollution damage after the fact and often at the cost of the people (Kawakami 2012: 153).

In 1945, at the end World War II, Japan served as the General Headquarters (GHQ) of the Allied Powers and subsequently regained independence in 1952. After the war, in line with the policy before the war and even throughout the restoration age, economic activities were emphasized over the preservation of nature. During the period of high economic growth (1955–1973), environmental destruction accelerated as the economy flourished. In addition to air pollution and the contamination of rivers, environmental pollution befell the entire nation.

In the mid-1950s, local institutes started reporting cases of Itai-Itai disease and mass media from all over the country started addressing the topic (Japan Environmental Management Association for Industry [JEMAI] 2002: 31). In

1956, Minamata disease was officially discovered. In 1960, residents of Yokkaichi complained of asthma symptoms and the issue of Yokkaichi asthma began to be recognized. In 1964, residents of Niigata Prefecture started complaining of symptoms related to organic mercury intoxication, which included symptoms similar to Minamata disease. Subsequently, people began referring to the disease as Niigata Minamata disease or the second Minamata disease. The diseases appearing sequentially after the mid-1950s – Itai-Itai disease, Minamata disease, Yokkaichi asthma, and Niigata Minamata disease – were known as the Four Major Pollution Diseases and are recognized as one of the most serious environmental pollution disasters in history.

Local governments took the first action in response to deteriorating living conditions. In 1949, the Tokyo Metropolitan Government enacted the "Factory Pollution Prevention Ordinances," an action which influenced nearly all of the prefectures in their establishment of pollution prevention ordinances by the mid-1960s (JEMAI 2002: 44). However, most of the ordinances did not stipulate quantitative standards regarding discharge, which means they were not sufficiently effective to prevent environmental degradation (JEMAI 2002: 44; Kawakami 2012: 156).

Policies at a national level were also considered after the mid-1950s, but their progress was prevented by proponents of economic growth. In 1955, the Ministry of Welfare (currently the Ministry of Health, Labour and Welfare) submitted a draft outlining a living environment antipollution standard, and 2 years later, they presented a draft amendment to the relevant government offices; however, too many opposing voices forced them to abandon the draft (JEMAI 2002: 44–45; Kurasaka 2014: 23). Later, in 1958, the "Laws about Water Quality Conservation in Public Waters" and the "Laws about Industrial Effluent Regulations" were established, and the "Laws about the Regulation of Soot Discharge" took effect in 1962. However, these governmental countermeasures against pollution were "follow-up" regulations that addressed the matters after the fact and were thus not very effective (Kawakami 2012: 157; Kurasaka 2014: 24, 28).

## Changes in Public Opinion and the Pollution Diet

By the 1960s, high levels of economic growth caused damage by spreading and intensifying pollution throughout the nation. Pollution policies from the end of the 1950s to the beginning of the 1960s may be summarized as follows: a pre-existing law that regulated pollution sources in each specific area (JEMAI 2002: 57), a method to regulate each individual source from various angles, and a follow-up regulatory measure that was a temporary expedient and lacked a unified connection (Kurasaka 2014: 28). After much introspection, in 1967, the Basic Law for Environmental Pollution Control was issued and the system of laws related to pollution was revised. The definition of pollution was set by the Basic Law for Environmental Pollution Control and aid for victims and laws related to pollution were discussed. Facing disagreements on pollution regulation from the ministries within the central government, the administration acted without waiting for political support (Mori 2013: 32); however, pollution problems just kept escalating (Kawakami 2012: 158; Kurasaka 2014: 30).

In 1967, starting with Niigata Minamata disease, lawsuits were brought concerning the four major pollution-related illnesses and the mass media began broadcasting the damage caused by pollution (Mori 2013: 57). In 1970, a series of new cases of urban public pollution developed and the media was reporting on pollution problems every day, stimulating public interest (JEMAI 2002: 67).

Looking at the trends revealed through public opinion surveys, we can see a change in public opinion towards environmental problems from the late 1960s to establishment of the Pollution Diet in the 1970s. (For the results of the survey, refer to the Prime Minister's Office 1966, "Public Opinion Survey on Pollution." (http://survey.gov-online.go.jp/s41/S41-08-41-16.html, accessed January 16, 2017).) In the "Public Opinion Survey on Pollution" conducted by the government in 1966, the following question was asked: "Do you agree with the idea that causing pollution during manufacturing is unavoidable, but as long as there is adequate protection, it is fine?" The

responses were as follows: 27.4% of respondents said "No, never permit it," 37.7% said "It depends on the damage," and 29.3% said "Yes, it is inevitable." This survey shows that almost 30% of respondents thought pollution was unavoidable regarding the trade-off between economic growth and pollution. On the other hand, according to the "Public Opinion Survey on Environmental Problems" (For the results of the survey, refer to the Prime Minister's Office 1971, "Public Opinion Survey on Environmental Problems." (http://survey.gov-online.go.jp/s46/S46-11-46-14.html, accessed January 16, 2017)) conducted by the government 5 years later in 1971, 51.2% of people answered, "Environmental protection is more important," when asked about the trade-off between economic growth and environmental protection. Additionally, regarding the question, "Do you agree that there should be environmental protections policies even if it increases the national economic burden?" 42.1% of people answered, "Yes, it is necessary even with the increase." Similarly, regarding the question, "Do you agree that to establish pollution prevention policy, there will be an increase in the price of manufactured products?" 40.9% of people answered, "Yes, pollution prevention policy is necessary." Over these 5 years, the trend of public opinion shifted greatly. As Mori (2013) pointed out, ever since the lawsuits concerning the four major pollution-related illnesses, the mass media reported on pollution more frequently and that put pollution problems on the public agenda.

Thanks to this increase in public concern, the Liberal Democratic Party and the government began to recognize the necessity of solving pollution problems (Mori 2013: 32). At the 64th extraordinary Diet session, known as the "Pollution Diet," the Basic Law for Environmental Pollution Control along with 14 bills related to pollution were passed, and in 1971, the following year, the Environment Agency was established. Four new departments were founded under the Environment Agency: the Planning and Coordination Bureau, the Air Quality Bureau, the Water Quality Bureau, and the Nature Conservation Bureau. There were two main issues with the establishment of the Environment Agency: the comprehensive regulation function for pollution administration and how much authority would be shifted from other ministries in order to implement programs. The ministries marked for authority-transfer strongly resisted, and only the former Ministry of Welfare transferred its National Park Service (Imamura 1976: 55).

## New Environmental Problems and Stagnation of Environmental Policy

Japan's environmental policy took a great leap forward from the Pollution Diet to the establishment of the Environment Agency; however, due to the deterioration of the economy as a result of the oil crisis, Japan went through a period of stagnation. After the mid-1970s, the environmental administration took a step backwards by postponing harsher automobile emission regulations and easing up on environmental standards for nitrogen dioxide (Kurasaka 2014: 38). The representative example of the environmental policy stagnation at the time was legislation on environmental impact assessments. From 1976 to 1981, the Environment Agency tried to legislate environmental impact assessments six times, but they failed repeatedly (Mori 2001: 142). This was because public concern shifted from environmental preservation to economic growth, which made it difficult to garner support for promotion of the policy (Kubo 1998: 436).

Additionally, after the 1970s, environmental issues became global issues. In 1980, Japan took part in international conventions such as the Washington Convention and Ramsar Convention, required Japan to address global environmental problems. In the late 1980s, protecting the ozone layer and dealing with global warming emerged as critical issues. (Kubo (2012) is one example of a study conducted on countermeasures against global warming after the 1980s.) In 1992, the United Nations Conference on Environment and Development was held in Rio de Janeiro, Brazil, which raised the mass media's awareness of environmental problems (Kurasaka 2014: 45). In addition to these new global environmental problems, countermeasures against vehicle emissions and

urban/lifestyle-related pollution resulting from domestic sewage began to be recognized, which generated the need for new policies such as those targeted at reducing waste and promoting recycling (As for research on the administration of waste at the time, Kubo (1998) and Yorimoto (1998) studied the legislative process of the Containers and Packaging Recycling Law of 1995) (Ibid: 45, 47).

After the establishment of the Environment Agency, the environmental administration proceeded to concentrate its work within two fields: pollution and nature conservation. However, issues arose which could not be easily classified into these categories, such as global environmental problems, waste problems. Other emerging problems could not be addressed by conventional regulations such as urban and lifestyle-related pollution, which led to the creation of the Basic Environmental Law in 1993 (Ibid: 47–48). The creation of the Basic Environmental Law combined the Basic Law for Environmental Pollution Control and the Natural Environment Conservation Law into one fundamental law. From this new perspective, the Basic Environmental Law aimed to contribute to the welfare of human beings and to move policies forward in a planned manner, and the law began addressing new environmental problems and global environmental problems that the preexisting regulations did not address (Ibid: 96–97).

## Establishment of the Ministry of the Environment and the Environmental Policy of the Twenty-first Century

The Environmental Agency was promoted to become the Ministry of the Environment by central government reforms in 2001, even as other ministries and agencies of the national government were restructured, reduced on a large scale, and consolidated from 22 ministries and agencies to 12. With the promotion to the status of a ministry, the Administration of Waste Treatment was transferred from the former Ministry of Welfare to the Ministry of the Environment, and the Waste and Recycle Countermeasures Department was established in the Minister's Secretariat. Each ministry department was also reformed. For example, the former Planning and Coordination Bureau developed into the Environmental Policy Bureau and the former Nature Environment Bureau developed into the Nature Conservation Bureau. The former Air Quality Bureau and former Water Quality Bureau, which were primarily in charge of pollution problems, were integrated into the Environmental Management Bureau and the former Global Environment Department, which was only a "department" was promoted to the Global Environment Bureau. (For more information on the change of the organization during the restructuring of the ministries, refer to Kamoshida and Tanaka (2001).)

The number of employees, which was 501 at the establishment of Environment Agency, doubled over the next 30 years, eventually reaching 1131. In Japan's central government, in order to prevent the expansion of administrative organizations, "The Principle of Scrap and Build" (In principle, when establishing new bureaus, departments, or sections, those of equivalent status that exist at the time are to be abolished) and "The Total Staff Number Law," which set forth a fixed number of employees for administrative organs, were promulgated, and compared with other developed countries, the number of public service workers in the central government was kept very small. Under such circumstances, it can be said that the promotion of the Environment Agency to the Ministry of the Environment and the increase in the number of long-term employees were exceptional cases. This also proves the rise of the administrative need to address environmental problems.

Environmental policies enacted after the turn of the century envisioned three idealized societies: the "low-carbon society," the "recycling society," and the "society of harmonized contacts between people and nature." Measures promoting these idealized societies (Kurasaka 2014: 50) re-enforced movement towards a "low-carbon society." The Kyoto Protocol adopted at the 3rd Conference of the Parties of the United Nations Framework Convention on Climate Change (COP3) took effect in 2005, pushing forward

global warming policies and energy policies for greenhouse gas reductions. As for the "recycling society," the Basic Law for Establishing a Recycling-based Society was promulgated in 2000 and countermeasures for waste and recycling were expanded. Finally, for the "society of harmonized contacts between people and nature," the Basic Act on Biodiversity was passed in 2008. As the national strategy for biodiversity became legally defined, local governments were obligated to draft local strategies for biodiversity. In 2010, the 10th Conference of the Parties to the Convention on Biological Diversity (COP10) was held in Aichi Prefecture, and since then, interest in biodiversity conservation has been increasing.

## Conclusion

We can summarize the changes in Japan's environmental policy from the end of World War II through the present as follows: between the early postwar period and the period of high economic growth, the strategy was to address pollution problems and the destruction of nature after the fact. Subsequently, triggered by the Pollution Diet in 1970, the Environment Agency was established and the regulatory administration was reinforced. Japan underwent a period of stagnation after the oil crisis, and after the legislation of the Basic Environmental Law, comprehensive and systematic administration was the goal of environmental preservation. It can be said that Japan's environmental policy has developed from a regulatory administration to a comprehensive environmental administration that includes a planning administration.

# Epistemology

Habibul Haque Khondker
Humanities and Social Sciences, Zayed University, Abu Dhabi, United Arab Emirates

## Definition, Sources, and Evolution of the Concept

The root word of epistemology is episteme, which in ancient Greek meant knowledge; hence, it can be defined as the philosophical basis of knowledge. The foundational question of epistemology

is how we know what we know. Epistemology is a branch of philosophy that goes to the roots of our knowledge by asking not just the methods of acquiring knowledge but also to examine the conditions and the context of knowledge generation. Epistemological questions, in simple terms, are meta-methodological questions. That is one has to go beyond the issues of methodology and ask questions such as the presuppositions of the methods and the methodological choices. As one may ask how we know what we know, one can also ask: Why do we prefer quantitative methodology and not qualitative methodology while studying a given subject? Is it because the intrinsic characteristics of the subject matter demand quantitative or that it corresponds with the qualitative method, or are there other reasons for choosing that methodology? Is there a presumed fit between the methodological assumptions of the chosen method and the subject of study that one chooses?

Epistemology is one of the branches of philosophy alongside ontology, ethics, and metaphysics. Ontology and epistemology are often mentioned as a pair. The former is the study of being, the latter of knowledge. Epistemology over time has also become discipline specific. In sociology, there is a branch of knowledge that is called the sociology of sociology (Friedrichs 1970), which critically examines various assumptions of the discipline of sociology, its knowledge criteria, and its methodologies.

Epistemology provides an important intellectual tool of evaluation for judging the quality of knowledge by questioning the underlying assumptions of knowledge generation. This does not mean that epistemological rules and standards are fixed, unified, or immutable. Both the Lockean method of knowledge generation through the sensory perception and the Cartesian method of knowledge gain through intuition are both valid. Epistemology as a referee would adjudicate whether within the empirical framework knowledge is valid if it professes to be an empirical study. Yet the rules, assumptions, methods, and epistemological principles may change over time. Although the classical Indian or Greek philosophical traditions dealt with the questions of knowledge, it is only from the time of John Locke (1634–1704) and David Hume (1711–1776) that the question of epistemology has been manifest. In *An Essay Concerning Human Understanding*, published in 1689, John Locke stated that his purpose was "to enquire into the origin, certainty, and extent of human knowledge." For Locke, knowledge is sense perception. John Locke was the first modern philosopher who defended empiricism. For Locke the human mind is an empty slate on which knowledge is inscribed. Hume in *An Enquiry Concerning Human Understanding*, published in 1748, underscored the importance of experience and observation as the bases of knowledge advancing the cause of empirical knowledge. There is a consensus in philosophical circles that there are multiple sources and methods of gaining knowledge of which empiricism is one. The idea that knowledge can be gained from intuition and logical deduction can be attributed to Rene Descartes (1596–1650). Descartes, who is regarded as the first modern philosopher, initiated the template for the discussion of epistemology among other philosophical concepts.

Positivism is the epistemological basis of empiricism. The central idea of positivism is to view the world as guided by scientific laws that are understandable and amenable to scientific methods. Science is universal and unified. The methods of social sciences are indistinguishable from those in the natural sciences. Auguste Comte (1798–1857) founder of sociology championed this view. Later, Emile Durkheim (1858–1917) advanced the positivistic view of social sciences to establish sociology on a firmer scientific foundation. Karl Marx implicitly accepted the primacy of science, and one of the prominent interpreters of Marx, Louis Althusser, averred that there was an "epistemological break" in Marx as the scientific-minded Marx grew out of his youthful contributions where he was concerned with issues of alienation and other philosophical matters.

The critique of the positivistic view of social science was embedded in the philosophical circles, for example, in the writings of Wilhelm Dilthey (1833–1911) who contrasted between explanation and understanding and posited that natural sciences seek to explain the world out there, while social (and historical) sciences seek to understand the inner meaning of human conduct; this view influenced Max Weber

(1864–1920) as reflected in his famous *Verstehen* (interpretation) method. Weber followed this tradition of hermeneutics to develop "fact" "value" distinction in social sciences. Weber presented both a nuanced and balanced view of the need for an empirical understanding of the social reality without neglecting the valuational and interpretative dimensions. Hans-Georg Gadamer (1900–2002) advanced hermeneutics in the twentieth century and influenced Jurgen Habermas (1929–) and Gianni Vattimo (1936–). The weaknesses of the positivistic epistemology in social science were diagnosed by various theoretical perspectives in sociology such as ethnomethodology, interpretative sociology, or thick description (Geertz 1973) who sought to explain by understanding the subject and wanted to bring in the subject's point of view. Both quantitative studies and abstract theory buildings came under attack from assorted perspectives in social sciences. Epistemology itself came under attack by the ideas of the non-foundational basis of knowledge (Rorty 1980), which paved the way for the rise of what came to be known as the postmodernist critique of conventional knowledge. The epistemological position of critical realism of Roy Bhaskar (1975, 1989) sought to strike a balance between taking a hard realist position of accepting reality as concrete, the undifferentiated thing in itself to the subjectivist, constructivist position underwritten by hermeneutics that reality exists in our consciousness and not out there. Critical realism is premised on the ontology of social reality, differentiated and nuanced, still a reality, nevertheless. The critical reality position is not naïve and harmonious with common sense.

Below we explore some of the important critiques of epistemology.

## Critique of Epistemology

In the wake of a variety of social movements and protests that began globally in the 1960s, new ideas such as alternative epistemology, feminist epistemology, indigenous knowledge, African epistemology, and local knowledge gained ground.

Feminist epistemology needs to be viewed in the context of larger feminist movements against patriarchy and the injustices of capitalism. "Feminist epistemology is about the ways gender influences what we take to be knowledge" (Anderson 1995, p. 50). Feminist epistemology questions whether the dominant male-dominated epistemology can address the gender-sensitive ways of knowing from the women's point of view. "The term 'feminist epistemology' calls upon us to replace a male-centered epistemology with a female/feministcentred one" (Halberg 2011).

Sandra Harding (1993) criticized science as male-dominated and called for a female-centered science. Feminist epistemology criticizes science to be biased against women and argues that the world of women is different from the men's world that the epistemology of the men's world may not apply to the studies concerning the world of women. This claim deserves serious consideration as this is similar to the demands for indigenous knowledge. These two positions can be subsumed under alternative knowledge claims.

The claim that the world of women is different to the extent that an alternative approach to knowledge is necessary stands on the principle of difference. Indeed there are issues concerning women that are different from the concerns of men, and a more sensitive approach or methodological strategies may be more suitable to capture those unique issues. But certain demands of knowledge generation such as evidence-based knowledge and standards of science cannot be relaxed. Such relaxation will harm the development of knowledge.

Some writers have suggested that there is a unique African epistemology that can be viewed as a way the African conceptualizes, interprets, and apprehends reality within the context of African cultural or collective experience (Anyanwu 1983, p. 60). The first question is: What is meant by Africa? The entire continent of Africa, or specific geographical regions, or specific countries?

According to Amaechi Udefi: "The idea of African epistemology is based on their (its advocates) acceptance that such concepts as knowledge, truth, rationality, etc., can be interpreted using African categories and concepts as provided

by the African cultural experience without recourse to the Western or alien conceptual framework. Thus this epistemology is abstracted from the collective world-view of Africans and leaning essentially on such materials as myths, folklore, proverbs, folk wisdom, etc." (Udefi 2014, p. 108). Udefi cites Senghor who denied Africans the capacity for rational discourse and reduced African knowledge-seeking through sensuality and emotion. Such an idea of African epistemology "unwittingly justifies... Levy-Bruhl's ascription of the child-like and pre-logical mental frame to the Africans" (Udefi 2014, p. 110).

The rebuttal to the claim of a distinctive African epistemology comes from African philosophers. "Epistemology, wherever it is practiced, is the same, and just as one does not find a distinctively Chinese or American or African mathematics, so, too there is no such thing as a distinctively African epistemology" (Kaphagawani and Malherbe 1998, p. 206).

Here two problems come to the fore. One is the problem of relativism, and the other is the problem of subjectivity. Subjectivity is an intrinsic part of what we do, and knowledge generation is not excluded. Subjectivity incorporates our lived experiences, our cultural and social presuppositions, our traditions, and our social and intellectual milieu.

In the case of women, many of the differences are related to their subjective experiences, similar to the experiences of minority groups or people who feel they have been marginalized such as the African Americans in the USA or Muslims in India, etc. It is reasonable to suggest that one has to see things from the point of view of the marginal groups. In these cases, subjectivity is an important and valid issue. This is also consistent with the holistic view in social sciences that a researcher needs to see the object of study from multiple points of view so as not to be blindsided.

The problem with relativism is that it results in different standards. For example, when one says, "Chinua Achebe is a great writer," it is different in connotation from stating that "Chinua Achebe is a great African or Nigerian writer." The former, a more appropriate characterization, is diminished by the relativism of the latter statement. Relativism in knowledge may serve some old-fashioned nationalistic purpose, but by failing to be a part of the universalistic knowledge fails to contribute to the universal repository of knowledge and thus denies the humanity from the benefit of that knowledge. At the same time by being insular, it becomes self-serving and entitled. A position of relativism creates an echo-chamber and not critical knowledge.

Some writers raised the issue of captive mind (Alatas 1974), Orientalism (Said 1978), and intellectual colonialism (Goonatilake 1982), perspectives that share a common concern of western dominance or hegemony of knowledge. Some of the protagonists of these perspectives have issued calls for indigenous knowledge or the development of alternative perspectives. These challenges do not constitute an attack on epistemology; rather, these are useful whistleblowing exercises that point out biases of certain perspectives or paradigms. For example, the critique of the dominant epistemological perspective, positivism came from within the so-called western academia. And subsequently the critique was shared by scholars outside of the western sphere. The division of the world of knowledge between western and non-western is not helpful and ironically vitiates the critical works themselves. The critique of binarism is retained in the critiques.

Whether one takes the subjects' or subaltern's points of view, the result should be to enrich the universal fund of knowledge, not relativist or partial knowledge. The Subaltern Studies group of historians (Guha 1981) contributed to the creation of a new paradigm in history-making the voices of the subalterns and marginals heard, but they did not want to create a sub-field of history. They posed, rightly, a challenge to mainstream history and contributed towards making history more inclusive. The contribution of subaltern studies enriched universal history, not a particularistic history.

## Epistemology, Paradigm, and Meta-Theory

Thomas Kuhn's (1970) study of the scientific revolution introduced the concept of paradigm.

A paradigm is an umbrella for theories. Scientific activities are puzzle-solving activities. In normal science, theories are drawn from a dominant paradigm. When the puzzle-solving is hindered by the inadequacies of the theories, new paradigms are created. Sociology of knowledge has explored various paradigms in various fields. Paradigm is a centralizing principle as it is also a guiding principle for generating knowledge within a certain field. In physics, the Newtonian paradigm dominated for nearly two centuries after which new knowledge about the natural world raised questions about the mechanistic view of knowledge that the Newtonian world view presupposed. As the existing paradigms failed to explain the new conditions and the embedded knowledge in these phenomena, new paradigms emerged. For example, in physics, the mechanistic view of the world has been replaced by a relativistic view that originated from the contributions of Albert Einstein, Danish physicist Niels Bohr, and Werner Heisenberg. Einstein in his theory of special relativity posited that space and time are relative to each other. Heisenberg's uncertainty principle postulated that the position and velocity of a (sub-atomic) particle cannot be measured at the same time.

Ilya Prigogine and Isabelle Stengers' *Order Out of Chaos* (1984) and Ilya Prigogine's *The End of Certainty* (1997) questioned many of the commonly held assumptions of science and introduced concepts such as "dissipative structure," indeterminism, nonlinear systems, and uncertainty as intrinsic features of scientific understanding of nature. These ideas not only revolutionized the conceptualization of the world of science and helped create a new cosmology, but it also impacted thinking of history and social sciences. Nonlinearity and disruptions became part of the social science language. The application of quantum theory and the discovery of string theory led to a paradigm shift in physics which also influenced social sciences; Immanuel Wallerstein's anti-systemic movement as an intrinsic part of the world system is an example of Prigogine's influence. A growing awareness of the paradigmatic and meta-theoretical basis of theories became routine in the discussion of social scientific theories.

## Epistemology in Public Policy: Limits to Alternative Epistemology

Many of the branches of social sciences, public policy and public affairs included, are often premised on shallow foundations of knowledge that fail to distinguish these branches of knowledge from information and common-sense understanding of the issues. International studies, for example, fail to go beyond the accumulation of information available in the public domain. Public policy professionals and analysts have to a large extent ignored the issues of epistemology unlike in sociology. Sociology since Max Weber's famous fact-value distinction has been embroiled in the questions of methodology and thus epistemology.

The discussion of epistemology is no longer confined to the philosophers. One of the benefits of holistic social scientific knowledge has been to integrate various branches of knowledge into a single whole to both broaden and deepen social scientific knowledge. It is important to reflect and then integrate epistemological discussion at the heart of social science, beyond the level of methodological discussions. Roy Heidelberg (2018) saw epistemology as a process of "legitimizing public administration as an academic exercise with application to the government." Public administration as a branch of social science deals with practical issues of people in society. It deals with facts and data in an objective, neutral manner to serve the interests of the public collectively. This premise is solidly crouched in the epistemological position of logical positivism and promotes quantitative data-driven methodology. This position is compatible with the culture of "big data" and the growing use of matrices. While the hermeneutic-oriented epistemology and the so-called constructivism may have limited purchase, the appropriate epistemological basis may be drawn from Roy Bhaskar's critical realism (Bhaskar 1975, 1989). The idea of evidence-based knowledge which is the very minimum norm of science becomes meaningless if we fail to accept the social reality.

## Conclusions

In the second decade of the twenty-first century, one of the problems the world is beset with is the circulation of both verified and unverified information; the latter led to the characterization of the society as a "post-truth society." This is a phenomenon that impacts not just public policy implementation but also the very science of public administration. As a field of inquiry, public administration plays an important role in safeguarding and advancing the public interest. In playing that role effectively and judiciously, a great deal of attention is needed to separate facts from fiction, truth from lies, for which a solid grounding in epistemological discussions is both a precondition and an obligation.

## Synonyms

Customer behavior; Developing; E-transport; Fiji

## Brief Definitions

Unified theory of acceptance and use of technology (UTAUT) – a combination of eight models that helps to understand user intentions as well as acceptance and the actual use of given technology.

Performance expectance – the user's belief that the use of the given technology can provide every day benefits.

Effort expectance – the given technology is easy and convenient for the user.

Social influence – the extent to which a user percieves that significant others believe that the user should use the given technology.

Facilitating conditions – the extent to which a user believes that organizational as well as technical infrastructure is available to support the use of the given technology.

Sacrifice – can be monetary and nonmonetary and includes time, search, and psychological cost the user bears to obtain a good or service.

## Introduction

Undoubtedly, information and communication technology (ICT) has changed the way industries and services operate. Public services, such as the public transport system, are no exception. The smart-card technology is no new phenomenon – "invented more than 30 years ago" (Blythe 2004, p. 47). Evidently, "electronic ticketing in public transportation based on smart cards is gaining momentum worldwide" (Welde 2012, p. 134) since 1990.

The perusal of international literature reveals a dearth of objective evaluations of such systems in developing country contexts. While various scholars have discussed several benefits for users of e-transportation systems for bus services, only a few researched on smart card but in a relatively developing context. Scholars have suggested extensive research on other countries aside the ones already studied to better understand e-transportation.

Above all, there are few empirical studies in transportation industries except for in airline industry with only a few published ones focusing on factors influencing e-ticket usage behavior which explains why still little is known about user motivations for using or not using e-ticketing schemes (Puhe 2014), the more the reason for more empirical research on social dynamics and contexts linked to e-ticketing usage (Puhe 2014).

This entry contributes to these gaps. It will examine the implementation of e-transportation in Fiji, a South Pacific developing economy, exemplified by an empirical research of regular commuters of tertiary students of a regional university – The University of the South Pacific (USP). To the best of the researchers' knowledge, there has not been any study on developing countries in the context of Pacific Island countries (PICs). Furthermore, Fiji's case is unique since it is the only PIC that has implemented e-transportation. In particular, this entry focuses on factors influencing the use of e-transportation card of tertiary students as bus commuters. In addition, unlike earlier research that have used 8 or 20 questions questionnaire, this entry has used a total of 37 questions to make this research more comprehensive. In addition, the SPSS v25 software program was used for descriptive statistical methods while SPSS AMOS v26 was used for structural equation model and further analysis. However, researching into the views of other stakeholders is beyond the scope of this study. Nonetheless, the study can prove valuable and be applied to other PICs' planning such transportation systems.

## Literature Review

The concept of sustainable mobility (Puhe 2014) and growing cashless services have driven countries like Australia, New Zealand, Nigeria, Canada, USA, China, Japan, Hong Kong, Malaysia, Europe, and Fiji to invest in e-transportation systems for bus services. It is the smart card tool that enables e-transportation to function. Smart cards are used for a number of different transportation applications, among which ticketing is the most widespread (Puhe 2014). Smart cards have unique names such as Melbourne's Myki (Transport Ticketing Authority 2009), Adelaide's Metrocard (Pratibha 2017), Canberra's MyWay Transport card (Pratibha 2017), South Korea's T-money (Korea4expats 2015), Hong Kong's Octopus card London's Oyster card (Transport for London 2019), and Fiji's e-transport card (Pratibha 2017). The last 15 years has seen a growing number of smart card schemes being launched, many of which are a result of the success of large-scale e-ticketing schemes in Asia (Blythe 2004). This has led to increased interest

in investigations into the benefits and costs of smart card ticketing for public transportation. Various scholars like Booz and Hamilton (2001), Diab et al. (2015), Iseki et al. (2008), and Welde (2012) have discussed several benefits for users of e-transportation systems for bus services such as ease of use (time and cost savings), reliability, increased travel convenience, flexible ticketing, lesser need to carry cash, and card balance protection (durability). Still, as per Diab et al. (2015, p. 6), "it is rare to find empirical studies in the literature investigating the value of time savings that come as a result of service improvements." Blythe (2004) claims that smart cards provide market data and research on when and where consumers use cards. Thus services could be reengineered to more readily meet a traveller's needs. E-transportation results in reduced need for cash (Welde 2012) which not only promotes a cashless economy but also fosters safety for passengers. Yet, Welde (2012, p. 134) argues that, while "it is widely recognized that smart cards can deliver benefits . . .," the benefits of e-transport systems have been overly optimistic (Welde 2012). Iseki et al. (2008) adds that benefits of such systems are also often vague and unclear on whether benefits outweigh costs. Habits, attitudes, and preferences play a decisive role in transport behavior which depend heavily on individual contexts such as the end user trip purposes (commuting, leisure, business travel), frequencies (daily, regular, occasional), travel distance, and destinations (rural or urban). While a lot of research has been carried out to understand e-transport systems, there are still gaps in literature that need attention which this research attempts to address. Apparently, the benefits of a cashless transportation system are manifold, especially in developing countries (Mondato 2019). While there are studies on developing country e-transport systems like Kenya, Philippines, and Rwanda, some scholars describe "public transport in developing countries as unreliable, expensive, and unsafe in a macroscopic way." Such studies are thus incomplete since they fail to investigate "the deficiencies of public transport payment preference from the perspective of the passengers". A few scholars did "research on smart card" but "with a relatively developing context such as Metro Manila". Furthermore, in addition to "the imitations of previous studies and the lack of general methodologies. . ." (Welde 2012, p. 137), empirical studies in transportation industries have been scant except for in airline industry (Sumaedi et al. 2012; Wen et al. 2005). Given that e-ticketing is complex, involving many actors who need to readjust (Welde 2012, p. 144), better understanding of user intention and adoption is still required and important (Sumaedi et al. 2012) especially when only a few published studies focus on factors influencing e-ticket usage behavior. In the recent 5 years, the mobile-payment mode has attracted much more interest than smart-card ticketing adoption. Hence, only little is known about user motivations for using or not using e-ticketing schemes (Puhe 2014). Empirical research is also needed on the social dynamics and contexts linked to e-ticketing usage of potential users (Puhe 2014). Scholars like Iseki et al. (2008) and Welde (2012) mention that benefits also appear overly optimistic and vague. Also, while some research cast little doubt on smart card benefits, the benefits accrued to each stakeholder may vary (Iseki et al. 2008). The present study thus contributes to the abovementioned gaps by investigating the behavioral intentions of using e-transportation card in bus transport in a developing PIC. The users are of particular importance since it is their decision of using the e-ticketing system that makes the scheme successful (Puhe 2014). Also, extensive research on other countries aside the ones studied, "seems essential to improve the understanding of the state of different field" (Sumaedi et al. 2012, p. 84) since a one-size-fit-all product may not fully address user needs. Therefore, solutions should not be globally dictated but rather locally informed (Blythe 2004; Mondato 2019). In filling the gaps in literature, the study also highlights how Fiji adopted the characteristics of the global e-transport system and custom-made it to suit its developing economy and its end user needs. The key objectives of this study are: (1) to examine what influences behavioral intention in using e-transportation card in buses; (2) to modify the UTAUT model by incorporating an

additional element and removing a moderator to make it suitable to the context being studied; and (3) to assess the effectiveness of the modified model empirically. The remainder of this entry is organized as follows. The next section reviews the theoretical underpinnings, stating hypotheses using the modified UTAUT model. The following section describes the quantitative research methodology. The subsequent section presents and discusses the empirical results. The final section highlights limitations and implications, and makes suggestions for future research.

## Theoretical Underpinnings: UTAUT

Among the various competing and complementary models on IT acceptance and adoption, one of the most popular models namely, the technology acceptance model (TAM) has evolved over the years into the unified theory of acceptance and use of technology (UTAUT). This is now one of the latest developments in general technology acceptance models. UTAUT has been used to understand the users' intentions and acceptance of technology. It is a combination of eight models (Venkatesh et al. 2003; Venkatesh et al. 2013) which are: Theory of Reasoned Action (TRA) (Davis 1989), Technology Acceptance Model (TAM) (Davis 1989), Theory of Planned Behavior (TPB) (Taylor and Todd 1995), combined TAM and TPB (Taylor and Todd 1995), Motivation Model (MM) (Vallerand 1997), the Model of PC Utilization (MPCU) (Thompson et al. 1991), the Social Cognitive Theory (SCT) (Compeau and Higgins 1995), and the Diffusion of Innovation Theory (DOI) (Rogers 2003). This combination makes UTAUT more complete, enhancing its explanatory power in user intentions furthering the usage behavior as well as acceptance and the actual use of technologies, leading to its extensive use in applied research. The resulting UTAUT model comprises of four main elements and four moderators. The four main elements are: (1) performance expectance, (2) effort expectance, (3) social influence, and (4) facilitation conditions. The four moderators are: (1) gender, (2) age, (3) experience, and (4) voluntariness (Venkatesh et al. 2003). The UTAUT model has been used to explicate behavioral intention of users' in various fields of study such as e-government services, mobile banking (Zhou et al. 2010), technology adoption – initial use and post-adoptive use and transportation systems (Madigan et al. 2016; Wu et al. 2012). For example, in Taiwan's Kaohsiung MRT system, the UTAUT model was used to investigate the adoption technology of the transit fare payment system of iPass transit smartcard. The results showed that most of the elements of the UTAUT model had a positive influence on the behavioral intention of the commuters. However, because UTAUT's explanatory capability on individuals' technology acceptance appears doubtful, the original UTAUT model has been modified with additional variables (Chao 2019). Similarly, this present study has modified the subject model, adding sacrifice as the fifth element and removed the forth moderator to make the model more suitable to the context being studied.

## The Four Elements of UTAUT Model

### Performance Expectance (PE)

Venkatesh et al. (2003) explains that a user's intention to adopt technology is based on how they perceive usefulness of technology. Thus, performance expectance is considered a vital element affecting a person's behavioral intention of usage. Studies by Madigan et al. (2016), and support this argument. In the present study, PE is described as the commuter's belief that using the e-transport card can provide every day benefits and has an added advantage over the traditional ticketing system (Venkatesh et al. 2003). Naturally, if e-transportation is more advantageous than the traditional cash system, passengers will find it useful in their daily life and value it. Some researchers have incorporated perceived value as a determinant of UTAUT construct. This present study likens performance expectance to perceived value since high transportation service quality will not eventuate without improvement in passengers' perceptions of value (Sumaedi et al. 2012). Prior studies have investigated the role of perceived value to gauge public transit passenger intention behavior.

Hence, ***Hypothesis 1***: Performance expectance has a positive and significant effect on the intention of commuters to use e-transport card.

### Effort Expectance (EE)

According to Venkatesh et al. (2003), effort expectance is the level of ease and comfort users feel when using technological systems. Introducing a new fare medium may be a burden as well as have associated learning costs for end users (Puhe 2014). Various research undertaken by Madigan et al. (2016), Venkatesh et al. (2003), and Wu et al. (2012) highlight that effort expectancy has a direct and significant effect on user behavioral intentions. In this study, EE is described as e-transport card being easy and convenient for the commuter, causing no apparent struggle when using the card. Convenience can be associated with a time-saving product or service – one that is easy to use, not complicated, and where users face no hurdles. E-transport card does reduce the need for carrying cash (Welde 2012) as well reduces the time spent on boarding and paying when compared to the cash system (Mondato 2019; Welde 2012) since users do not have to take the card out of their wallet to pay their bus fare and "do not have to worry about having enough money or exact change" (Iseki et al. 2008, p. 12). According to PFIP (2017), a Fijian commuter was not only excited with the e-card tapping experience but also relieved of carrying coins and change haggling hassle. Overall, research is indicative of time savings being the major benefit of e-transportation (see Welde 2012). Although this may be a small time saving for the individual, it is important to note that the individual passenger will save time at every stop and for every foregoing passenger who previously would have paid by cash.

Therefore, ***Hypothesis 2***: Effort expectance has a positive and significant effect on the intention of commuters to use e-transport card.

### Social Influence (SI)

Venkatesh et al. (2003, p. 451) explains that "social influence is the degree to which an individual perceives that important others believe that he or she should use the new system." The work of various researchers like Gupta et al. (2018) proved that SI is a paramount element in understanding user behavior intentions in adopting a new technology interface. Likewise, Wu et al. (2012) reported positive and significant impact of SI on user behavioral intentions for iPass smartcard adoption. Current research defines SI as the stress caused by family and known associates who influence the intent to use. The present study includes political agents as those exerting SI in Fiji. Notably, the e-ticketing system was a compulsory implementation by the Fijian government (Fiji Commerce Commission 2014). Thus, the Fijian public had no choice but to transit from cash to digital given the government's directive to digitize the bus public transit (PFIP 2017).

Hence, ***Hypothesis 3***: Social influence has a positive and significant effect on the intention of commuters to use e-transport card.

### Facilitating Conditions (FC)

According to Venkatesh et al. (2003, p. 430), FC are "the degree to which an individual believes that an organizational and technical infrastructure exists to support the use of the system." FC may include training programs on how to use new technology interface and helpdesk assistance to positively influence the user intention and rate of adoption. The present study describes FC as easy card registration, replacement of lost or stolen cards, various top-up locations, and the sale of disposable cards to support commuters' adoption of e-transport cards. Wu et al.'s (2012) study proved that FC affect commuter intention to use new technology.

Thus, ***Hypothesis 4***: Facilitating conditions have a positive and significant effect on the intention of commuters to use e-transport card.

### Sacrifice (S)

Researchers such as Maillet et al. (2015) suggested additional external variables to the UTAUT model to help better understand user ability in accepting IT changes. According to various authors such as Wen et al. (2005), sacrifice is perceived as the monetary and nonmonetary aspects including time, search, and psychological cost one bears to obtain a good or service. Wen

et al.'s (2005) study reported perceived sacrifice as statistically significant with a direct negative effect on perceived value. The willingness to use any technology is inversely related to risk – the higher the risk, the lower the willingness to use. The present study describes sacrifice as one's time and effort to top-up e-transport card, the need to find a kiosk or vendor close to the commuter, the psychological cost of not having enough credit on the card, and the feel of embarrassment when told that the card balance is low, leading to the commuter disembarking the bus.

Hence, ***Hypothesis 5***: Sacrifice has a positive and significant effect on the intention of commuters to use e-transport card.

### Moderating Factors

The UTAUT model includes gender, age, experience, and voluntariness of use as moderators. A number of studies that utilized the UTAUT model did not suggest the use of moderating factors (Williams et al. 2015) and those that did, focused on moderating factors of gender only, or gender and age (Yu 2012), or gender, age, and experience. Past studies have also used sociodemographic factors of age, income, education, and so forth to help with better explanation in analysis. Such sociodemographic factors help identify personal characteristics of bus commuters. In this study, the three moderating factors of gender, age, and experience will be used. The forth factor, voluntariness will not be used as the e-transport card is deemed mandatory if intending to travel by bus. These three moderating factors will help test the strength of association between the five independent variables and the commuters' behavioral intentions to use e-transport card. There is sufficient evidence to suggest that the moderating factor of *gender* has a significant effect on the behavioral intention to use new technology (Magsamen et al. 2015; Wang and Shih 2009). In a study conducted by Chiemeke and Evwiekpaefe (2011), women appeared more motivated to use technology because of the ease of use, while men are motivated to use technology because of its usefulness. In another study conducted by Wang and Shih (2009) on the use of information kiosk, women were more inclined to be influenced by their significant others than man. *Age* is also a significant predictor of behavior intention (Lu et al. 2009; Venkatesh et al. 2003), and according to Magsamen et al. (2015), age is seen as an integral element of behavior intentions. The study found that the older a person is, the more likely he or she will not intent to adopt a new technology. The older generation are more likely to use the new system if it is user-friendly (Wang and Shih 2009). Another study by Yu (2012) showed that the facilitating conditions were higher among the mobile banking users below the age of 30 and over 50, in terms of the use of mobile banking. *Experience* is also a significant predictor according to Chiemeke and Evwiekpaefe (2011).

## Proposed Research Model

The objective of this study is to identify factors influencing the bus commuter intentions to use e-transport cards in Fiji. The research model of the study is presented in Fig. 1. Various researchers have cited behavioral intentions as having positive and direct influence on usage behavior (Venkatesh et al. 2003). The behavioral intentions of student's use of e-transport card will be analyzed using Venkatesh et al.'s (2003) model of UTAUT with some modification of the added element of sacrifice drawn from the work of Prayoonphan and Xu. In social influence, the present study has added political influencers – no other study has looked at this contributing item in the *social influence* factor of the UTAUT model which makes the model unique and suitable to the context being studied. The elements of *PE* questions were sourced and modified from Venkatesh et al. (2003). The elements of *EE* questions were sourced and modified from: Iseki et al. (2008), Madigan et al. (2016), Welde (2012), Wu et al. (2012), and Venkatesh et al. (2003). The elements of *SI* questions were sourced and modified from Prayoonphan and Xu, Venkatesh et al. (2003), and Wu et al. (2012). The elements of *FC* questions were sourced and modified from and Venkatesh et al. (2003). The elements of *S* questions were sourced and modified from Wen et al. (2005). All five element questions were also integrated with the authors own perspective of questions relevant

to the research. This entry has used a total of 37 questions to identity areas that are related to the South Pacific perspective and has used more questions compared to various articles that have used the UTAUT model in relation to transportation systems, which makes this research more comprehensive. Authors such as Madigan et al. (2016) have used 8 questions in total, while Prayoonphan and Xu used 20 questions in total with other added elements. Figure 1 below presents the research model.

### Fiji's E-Transportation System

This study attempts to investigate into the factors affecting commuters' intention to use the e-transportation card for bus transportation, exemplified by an empirical research of tertiary students', in Fiji. Fiji, a parliamentary democracy in the South Pacific ocean is located about 2000 km northeast of New Zealand with an approximate population of 900,000 with two main islands of Viti Levu and Vanua Levu (COP23 2017–2018). Its road transport is serviced by private cars, taxis, rental and hire cars, heavy goods vehicles, buses, tractors, and motor cycles. Approximately 210,000 school and university students as well as more than 50,000 senior citizens depend on public transport (PFIP 2017). "Due to this heavy reliance on bus services, the bus industry is of national interest" (Consumer Council of Fiji 2017a: 1). Fiji has joined 71 other countries in cashless travel (Pratibha 2017). The primary purpose of introducing the e-transport card in Fiji was to eliminate cash handling and pilferage – an ongoing issue for years (Consumer Council of Fiji 2017b). Given the issue of pilferage, government announced compulsory implementation of an e-ticketing system on first October 2017 (Fiji Commerce Commission 2014; Consumer Council of Fiji 2017a). Such a system was first implemented in February 2013, however, marred with issues like charging of incorrect fares, poor availability of disposable cards in buses, lack of card top-up centers, and lack of proper training of bus drivers (Consumer Council of Fiji 2017a). Nonetheless, even developed countries like Singapore and Hong Kong faced teething problems. Therefore, Fiji being a developing country and the first PIC in the South Pacific to implement an e-transport system given resource constraints is a milestone in itself. In late December 2008, the Land Transport Authority (LTA) and Ministry of Works and Transport in conjunction with the FBOA engaged the UK-based Orion Consulting Associates to carry out a comprehensive review of the bus industry. The 2009 Orion report strongly

**E-Public Transportation, Quantitative Analysis in Fiji, Fig. 1** Research model: modified UTAUT model. Source: Venkatesh et al. (2003)

recommended prepaid tickets by installing ticket machines or e-ticketing. Every month, around $9.5 million is spent by the bus travelling public with bus companys' annual revenue of approximately $114 million (Pratibha 2018). Before the introduction of e-ticketing, a third of this amount was pilfered and not accounted for, resulting in unpaid taxes. In Fiji, the public had no choice but to transit from cash to digital given the government's decision to digitize the bus public transit (PFIP 2017). E-transportation is still a new service, initially test launched in 2013. When the system failed to function well back then due to poor self-regulation, government stepped into regulate e-ticketing by amending the Land Transport Regulations and invited various telecommunications agents to assist in the process. Commuters can either pay bus fares by using their e-transport cards or buy a disposable card for as little as $2 FJD from the driver. In Fiji, e-transportation benefits are twofold, direct and indirect. The direct benefit is fair assessment of bus fares based on reliable data. Indirect benefit for the consumers is – their taxes will no longer subside the bus industry because of poor financial performance of bus companies due to fraud. The Pacific Financial Inclusion Programme (PFIP) stated that advantages for end users include: greater transparency and control over targeting, coverage and distribution of the transport assistance/subsidy to the students, the pensioners, the senior citizens and the disabled citizens/residents; no cash or change requirement for passengers or drivers, resulting in speedy transactions; and the reduction in handling of cash and associated efforts and risks (PFIP 2017). In addition, the e-ticketing system provides the government and its stakeholders with the essential consumer data to help re-align or add resources to better meet the needs of the travelling public (Pratibha 2017). These user benefits are consistent with global studies (Blythe 2004; Welde 2012).

## Methodology

This study began with a thorough review of e-transportation literature the world across as well as reviewed relevant documents on the subject matter in Fiji. Upon sufficient secondary sources, questionnaires were distributed for bus commuters' responses for primary research. While a cross-sectional and self-reported data through a convenient sample has its limitations, this study used convenience sampling technique as like Sumaedi et al. (2012). The study was conducted in line with all ethical considerations. Tertiary students participated in the study voluntarily and were told that they could refuse to participate if felt uncomfortable. They were also informed that their participation will not affect their grades in the respective courses.

### Participants of the Survey

The researchers conducted the questionnaire survey, face-to-face targeting second and third year university student passengers during tutorials through convenience sampling. These are the students of the School of Management and Public Administration in Faculty of Business and Economics, the largest school in the University of the South Pacific (USP). USP was established in 1968 and "... is one of the [only] two regional universities in the world..." (p. 87). It is a regional university that is co-owned by 12 Pacific Island Countries – Fiji, Cook Islands, Nauru, Kiribati, Marshall Islands, Samoa, Niue, Tuvalu, Solomon Islands, Tonga, Tokelau, and Vanuatu. The reason behind selecting these commuters is their regular use of e-transportation cards. This selection makes sense since e-transport systems mostly benefit those who use public transport regularly (Puhe 2014). E-ticketing interests those who use public transport regularly, since it means time (and sometimes cost) savings (Puhe 2014). The authors of this entry are involved in teaching 200 and 300 level courses in the same school and have an easy reach of participants. Participants spent about 10 min to complete the questionnaire. The questionnaires were filled out between 8 and 18 October 2019. The questionnaire, based on previous studies then modified to conform to the context of this study and to better understand tertiary student commuters' in Fiji, was designed with a five-point Likert scale

ranging from strongly disagree (1) and strongly agree (5). The variables were developed after a thorough review of research related to the UTAUT model and e-transportation research. The Cohen's rule suggests a sample size of at least 10 times the number of the hypotheses for robustness. Hence, our modified model's hypotheses required a sample size of at least 90 participants – this was achieved for the study. Total sample collected were 202 of which 198 were considered valid for use in the study.

### Analysis of Data

Data was analyzed using SPSS v25 software program. To evaluate the data, descriptive statistical methods (number, percentage, mean, standard deviation) were used. SPSS AMOS v26 was used to carry out Structural Equation Modeling (SEM), path analysis, confirmatory factor analysis, exploratory factor analysis, covariance analysis, correlations, and multiple regression to perform hypotheses testing in order to support the research and theory. SEM is widely used by researchers in marketing and consumer research (Hershberger 2003). The use of SEM also helps researchers to be more precise in the specification of hypotheses and operationalization of constructs (Bagozzi and Yi 2012). It also takes into account reliability of measures in tests of hypotheses in ways going beyond the averaging of multi-measures of constructs. To the best of the researchers' knowledge, there has not been any e-transportation study that has used AMOS.

## Results and Discussion

### Descriptive Analysis

Of the 198 respondents, 33.30% were male (n = 66) and 66.70% were female (n = 132). Of the total respondents, 83.80% (n = 166) were full-time and 16.20% (n = 32) were part-time students. 5.10% of the respondents were less than 20 years old, 86.90% were between 21 and 30 years old, 6.10% were between 31 and 40 years old, 1.50% were between 41 and 50 years old, and the remaining 0.50% represented age groups older than 50. Frequencies obtained for a 198 sample size are consistent with USP's overall student-related statistics. In terms of gender, there are more females (11,085.5) than males (8,537.5) enrolled at the university (USP 2018). There are more full-time students (12,679.6) than part-time students (6,943.5) (USP 2018). Students were asked about the number of times they use the e-transport card. Forty-nine participants used e-transport card once (25.40%), 34 used it twice (17.60%), 21 used it thrice (10.90%), and 89 used it more than four times (46.10%). Majority students who responded to the questionnaire were between 20 and 30 years of age. This is because majority of students enrolled at USP are high-school leavers and youths. The survey indicates that of the five factors, performance expectancy matters most to passengers since the introduction of e-ticketing system for bus services in Fiji has brought about benefits for passengers. Performance expectancy variables in line with the perceived benefits include: usefulness of e-transport card compared to the traditional ticketing system, requires carrying of less cash, is reliable for passengers, makes it easy to track the use of cash spent on bus travel and budget, offers flexibility in terms of top-ups, is an efficient way to pay for travel, and allows for reduced boarding time.

From all the age groups, it is the 20–30 year olds that is more readier in adopting e-transformation scenarios. This maybe because they are the e-generation and are thus more tech-savvy and more technologically comfortable when compared to the other age groups. The other noticeable age group is the above 51 years' age group. Comparatively, their adoption rate of e-transport card is much lower and they largely prefer cash payments for public transportation. This maybe because of the old mindset of how public transportation has been used, comfort and convenience in using cash than card, and small bus fare budgets compared to pre-top ups of amounts greater than $2 FJD. This concurs with the study by Magsamen et al. (2015) who argued that the older a person, the more likely he or she will not intent to adopt a new technology.

## SEM and Hypotheses Testing

### Exploratory Factor Analysis (EFA)

The Kaiser-Meyer-Olkin measure of sampling adequacy (KMO) and the Bartlett's test of sphericity are the key assumptions of EFA. According to Pallant (2013), the KMO statistic ought to be greater than 0.50 and Bartlett's test of sphericity should be statistically significant ($p < 0.05$).

KMO and Bartlett's test in Table 1 showed that KMO statistic was $0.873 > 0.50$ and Bartlett's test of sphericity was significant ($p = 0.000 < 0.05$), and thus, the assumption for the confirmatory factor analysis (CFA) has been met. CFA was conducted, using the most used method of principal component analysis (PCA). Rotation was carried out using Varimax rotation method. Table 2 below shows communalities that measure the level of correlation between an item with all the items combined, the results of which should be a high common variance (>0.40).

Since the results in Table 2 show that none of the communalities were less than 0.40 thus, all the communalities were important for an efficient factor extraction. According to Pallant (2013), Kaiser criterion should be used to determine the number of components that would be extracted in EFA. This criterion only considers components with eigen value of 1.00 or above (Pallant 2013). The scree plot below is also used to show the number of components that would be extracted in EFA. Figure 2 below illustrates the scree plot showing the number of components that would be extracted in EFA.

The scree plot shows five screes above the eigen values. This evidences that there are five factors in this study.

**E-Public Transportation, Quantitative Analysis in Fiji, Table 1** Exploratory factor analysis: KMO and Bartlett's test

| | | |
|---|---|---|
| Kaiser-Meyer-Olkin measure of sampling adequacy | | 0.873 |
| Bartlett's test of sphericity | Approx. Chi-square | 3355.458 |
| | Df | 496 |
| | Sig. | 0.000 |

## Reliability and Validity Testing

The components extracted from PCA need to be validated before it is applied in SEM. Cronbach's alpha coefficient was used to determine the reliability and internal validity of components extracted from PCA. Reliability analysis was used to determine the internal validity and reliability of components. Tabachnick and Fidell (2007) argues that the generally acceptable threshold for the acceptance of alpha is 0.60. Table 3 below presents the results.

Results show that scale Performance expectance has good internal validity and reliability

**E-Public Transportation, Quantitative Analysis in Fiji, Fig. 2** Scree plot: number of components extracted in EFA

**E-Public Transportation, Quantitative Analysis in Fiji, Table 3** Reliability analysis: Cronbach's alpha coefficient, mean, and standard deviation

| Variable | Cronbach's alpha | Number of items | M; SD |
|---|---|---|---|
| Performance expectance | 0.873 | 7 | 3.72; 0.93 |
| Effort expectance | 0.874 | 6 | 3.80; 1.01 |
| Social influence | 0.639 | 6 | 3.63; 1.03 |
| Facilitating conditions | 0.879 | 8 | 3.49; 1.03 |
| Sacrifices | 0.745 | 5 | 3.73; 1.23 |

(alpha = 0.873). The average value of Performance expectance is 3.72 (M = 3.72; SD = 0.93). The results showed that scale Effort expectance has a good internal validity and reliability (alpha = 0.874). The average value of Effort expectance is 3.80 (M = 3.80; SD = 0.1.01). Results showed that scale Social influence has a good internal validity and reliability (alpha = 0.639). The average value of Social influence is 3.63 (M = 3.63; SD = 1.03). Results showed that scale Facilitating conditions has a good internal validity and reliability (alpha = 0.879). The average value of Facilitating conditions is 3.49 (M = 3.49; SD = 1.03). The results showed that scale Sacrifices has a good internal validity and reliability (alpha = 0.745). The average value of Sacrifices is 3.73 (M = 3.73; SD = 1.23).

### Confirmatory Factor Analysis (CFA) (Fig. 3 and Table 4)

Table 5 shows the results of moderation analysis. The moderating effect of gender, experience, and age were examined using AMOS.

E

The results of moderation analysis showed that gender has moderation effect between behavior intention and performance experience, and between behavior intention and social influence. The results showed that experience has moderation effect between behavior intention and performance experience, between behavior intention and social influence, and between behavior intention and facilitating conditions. The results also showed that age has moderation effect between behavior intention and social influence. In past studies by Magsamen et al. (2015) and Wang and Shih (2009), gender was reported to have a significant effect on the behavioral intention to use new technology. Studies by Lu et al. (2009), Magsamen et al. (2015), and Venkatesh et al. (2003) proved that age is a significant predictor of behavior intention and serves as an integral element of behavior intentions and the study by Chiemeke and Evwiekpaefe (2011) showed the importance of experience. The results also showed significant positive impact of performance expectance on behavior intention.

Therefore, Hypothesis 1: Performance expectance has a positive and significant effect on the intention of commuters to use e-transport card, is confirmed. This is in agreement with studies by Madigan et al. (2016), who argued that performance expectance is a vital element affecting a person's behavioral intention of usage. The results showed that there is positive but not a significant effect of effort expectation on behavior intention. Therefore, Hypothesis 2: Effort expectance has a positive and significant effect on the intention of commuters to use e-transport card, can be partially confirmed. Effort expectancy included variables such as passenger ease of use, convenient traveling, operability of e-transport card with/without assistance, and comfort in using card instead of cash for bus fare. This thus, only partially concurs with the findings of Madigan et al. (2016), Venkatesh et al. (2003), and Wu et al. (2012). This may be because tertiary students are still getting used to the e-transportation system which is still relatively new after the not so successful launch in 2013 when compared to better developed nations where locals have more experience with smart cards. At this point, it can be assumed that after some years and given more experience with e-transportation, this result may differ. The results showed significant but negative impact of social influence on behavior intention. Therefore, Hypothesis 3: Social influence has a positive and significant on the intention of commuters to use e-transport card, is partially confirmed. Here again, the result only partially agrees with the findings of Gupta et al. (2018) who claim that social influence is paramount in understanding user behavior intentions in adopting a new technology. Likewise, the result also only partially concurs with Wu et al. (2012) who reported positive and significant impact of social influence on user behavioral intentions for iPass smartcard adoption. In Fiji's case, it is worth noting that the public had no choice but to go digital given the government's directive, leaving little room for any other's (family/friends) significant influence (PFIP 2017). It was more of a coercive effort from the government. This is an unusual interesting finding specific to Fiji's situation. The results showed significant negative effect of facilitating conditions on behavior intention. Therefore, Hypothesis 4: Facilitating conditions has a positive and significant effect on the intention of commuters to use e-transport card, is partially confirmed, since the results showed significant, but negative effect of facilitating conditions on behavior intention. Once again, the result only partially agrees with Wu et al. (2012) whose studies proved that facilitating conditions affect commuter intention to use new technology. Fiji is still relatively new and not that well equipped with the needed facilitating conditions/infrastructure which can make e-transportation convenient. The results showed that there is no statistically significant effect of sacrifice on behavior intention. Therefore, Hypothesis 5: Sacrifice has a positive and significant effect on the intention of commuters to use e-transport card, must be rejected. This is in contrast to past studies like Wen et al. (2005) who reported perceived sacrifice as statistically significant with a direct negative effect on perceived value. This maybe because in Fiji, the sample commuters may not feel that: they are making significant sacrifices in terms of one's

time and effort in topping-up e-transport card, in finding a kiosk or vendor close to them, the psychological cost of not having enough credit on the card, and the feel of embarrassment when told that the card balance is low. The respondents have to top-up anyway to recharge mobile phones, the vendors are located close to USP and the study sample is tertiary students so it is assumed that this sample is not that psychologically affected than the sensitive senior citizens. For this group, not having enough credit or lower card balance may not be a big deal or common among them.

### Model Test for Fitness

CMIN/DF was used for the absolute fit indices. Table 6 depicts CMIN/DF results.

The results show that CMIN/DF = 0.476 < 3.00, confirming absolute fit. Table 7 below shows RMSEA results.

Root Mean Square Error of Approximation (RMSEA) was used for the non-centrality-based fit indices. The maximum threshold is 0.05. The values of 0.05 or lower indicate good model fit, while 0.06–0.08 indicate acceptable model fit. Since the RMSEA value is 0.000 < 0.05, results indicate a good model fit. The results (Tables 6 and 7) show that goodness of fit was not violated, thus confirming that model findings are valid. Also, there is enough evidence, except for H5 to support the claims that there is an association between the use of e-transport card and the respective variables of interest used in the questionnaire.

## Conclusion and Recommendations

This research attempted to contribute towards better understanding of user intention and adoption, a topic that is still deemed important as per scholars like Sumaedi et al. (2012) especially when only a few published studies focus on factors influencing e-ticket usage behavior. All in all, our research only confirmed H1 (Performance expectance has a positive and significant effect on the intention of commuters to use e-transport card). It only partially confirmed H2, H3, and H4 (Effort expectance, Social influence and Facilitating conditions have positive and significant effect on the intention of commuters to use e-transport card). It rejects H5 which was – Sacrifice has a positive and significant effect on the intention of commuters to use e-transport card. These results may be generalizable to other smaller PICs but may not be generalizable to other larger and better developed countries since the study is just premised in one small developing PIC and just based on the segment of tertiary students of one university. Also, studies using the same research model and questionnaire in other countries may bring about different findings. The self-reported questionnaire as the research tool is also a common limitation since interviewees may rush through, not express true opinions, select responses that may please the interviewer, all of which could lead to errors in the results. The research was also conducted within a short period. As Chao (2019) mentions, customer perception can change over time with new knowledge and accumulated experiences.

Nonetheless, findings from the present study can help better understand user issues of regular commuters, which can better inform the policy makers, bus service providers/operators, and the assisting mobile phone companies for improvement in the current system. For transportation scholars, the study suggests research on other segments and larger samples and, like Chao (2019), suggests longitudinal studies for updated findings. Furthermore, "...other key factors beyond the scope of this study could be incorporated to improve the explanatory power of the endogenous variables". For the industry and the economy, after sometime as the public becomes comfortable and readier towards card systems, recommendations are to use e-cards for other purposes aside bus transport like in some Asian cities. Integrated e-tickets could even be extended to tourism and leisure activities (Puhe 2014). E-transportation card can be applied to other modes of public transportation too like mini buses and taxis. Fiji may also look into integrated use of the card so that it can be linked to other services like parking meter payments as well as other retail purchases (Iseki et al. 2008).

Overall, the study advanced the research work in the area of e-transportation and in developing nations. It also modified the model to better understand user behavior intention in the bus industry. This paves the way for development of even more effective models. Our study, however, should not be taken to exemplify the entire e-transportation adoption scenario. Nevertheless, it is envisaged that this study will inspire scholars to further scrutinize the subject matter with larger scale studies, more comprehensive questionnaires, longitudinal studies, comparative studies, and use of other variables. Also, a one-size-fit-all product may not fully address user needs. Overall, this entry agrees with Blythe (2004) and Mondato (2019) who argue that solutions should not be globally dictated but rather locally informed.

# Equity Theory of Organizations

Elaine Hatfield[1], Jeanette Purvis[1] and Richard L. Rapson[2]
[1]Department of Psychology, University of Hawaii, Honolulu, HI, USA
[2]Department of History, University of Hawaii, Honolulu, HI, USA

## Synonyms

Fairness; Justice; Justifications; Social exchange

## Definition

Equity: How fair a relationship is perceived to be.
Inputs: What a person contributes to a relationship.
Outcomes: What a person gets out of a relationship.
Profit: A person's outcomes minus inputs.

## Introduction

In the eleventh century, St. Anselm of Canterbury (1998) argued that the will possesses two competing affinities: an affection for what is to a person's own selfish advantage *and* an affection for justice. The first inclination may be stronger, but the second matters, too. Equity theory, too, posits that in personal, social, and societal relationships, two concerns stand out. Firstly, how much reward does a person reap from a given social relationship? Secondly, how fair and equitable is that relationship? According to Equity theory, people feel most comfortable when their relationships are maximally profitable and they are giving and getting exactly what they deserve from their relationships – no more and certainly no less.

## Early Social Exchange Theorists

The first modern-day scholars to propose models of social exchange in organizations (in the late 1950s and early 1960s) were sociologists George C. Homans (1958) and Peter Blau (1964) and social psychologists John Thibaut and Harold Kelley (1959). They viewed all social life as involving the exchange of goods, such as approval, esteem, and material goods. All people, they contended, are seeking maximum reward at minimum cost. As a consequence, there tends to be a balance in exchanges. Morton Deutsch (1974) pointed out that in different societies, "justice" has been viewed as consisting in the treatment of all people:

1. As equals
2. So that they have equal opportunity to compete without external favoritism or discrimination
3. According to their ability
4. According to their efforts
5. According to their accomplishments
6. According to their needs
7. According to the supply and demand of the marketplace
8. According to the requirements of the common good
9. According to the principle of reciprocity (p. 21)

Relying on the economic and behavioristic theories of the day, these scholars attempted to describe the factors that mediate the creation, maintenance, and breakdown of exchange relationships. J. Stacy Adams (1966), an industrial-organizational psychologist, argued that management and labor attempt to maintain equity between the inputs (Is) they contribute to their work (such things as time, effort, and sacrifice) and the outcomes (Os) they receive from their work life (such things as security, salary, fringe benefits, etc.) compared to the Is and Os of their supervisors, peers, and employees. Relational satisfaction was assumed to depend on how fair (or unfair) were distributions of rewards.

Later, Elaine Hatfield and her colleagues (1978) proposed a model designed to integrate all these diverse insights: Equity theory.

### Equity Theory

Equity theory is a straightforward theory. It consists of four propositions:

Proposition I: Men and women are "hardwired" to try to maximize pleasure and minimize pain.

Proposition II: Society, however, has a vested interest in persuading people to behave fairly and equitably. Groups will generally reward members who treat others equitably and punish those who treat others inequitably.

Proposition III: Given societal pressures, people are most comfortable when they perceive that they are profiting from a relationship *and* are getting roughly what they deserve from that relationship. If people feel over-benefited, they may experience pity, guilt, and shame; if under-benefited, they may experience anger, sadness, and resentment.

Proposition IV: People in inequitable relationships will attempt to reduce their distress through a variety of techniques – by restoring psychological equity and actual equity or abandoning the relationship (Hatfield et al. 1978, p. 6)

#### Assessing Equity

Technically, Equity is defined by a complex formula. Respondents' perceptions of the

equitableness of their relationships are computed by entering their estimates of Inputs and Outcomes of Persons A and B ($I_A$, $I_B$, $O_A$, and $O_B$) into the Equity formula. (The Equity formulas used by previous researchers, from Aristotle to Stacy Adams, only yield meaningful results if A and B's Inputs and Outcomes are entirely positive or entirely negative. In mixed cases the formulas yield extremely peculiar results. This is simply a formula designed to transcend these limitations. See Walster (1975) for a discussion of the problems and the mathematical solutions. The superscript k simply "scales" equity problems (by multiplying all inputs and outcomes by a positive constant) such that the minimum of $II_A$ I and I $I_B$ I is greater than or equal to 1).

$$\frac{(O_A - I_A)}{(|I_A|)^{KA}} = \frac{(O_B - I_B)}{(|I_B|)^{KB}}$$

People are asked what they contribute to an organization (Inputs), (compared to their supervisors, peers, or workers) and how much profit they reap (Outcomes minus Inputs) (Young and Hatfield 2011; Walster 1975). A variety of factors shape people's perceptions as to how fairly treated they are in an organization. Probably all agree that intelligence, education, skill, training, seniority, experience, the possession of appropriate tools, effort, health, and so on "count." In special circumstances, some might also agree that such inputs as sex, ethnic background, social status, personal appearance, family responsibilities, the characteristics of one's spouse, and so on are important. Both employers and employees can probably agree that salary and such fringe benefits as health insurance, a retirement program, and "perks" (such as the right to park your car in a privileged location) are valuable outcomes. They can also probably agree that dangerous working conditions, job insecurity, and monotony are negative outcomes.

The complex formula is all well and good. However, scholars have discovered that a relationship's fairness and equity can be reliably and validly assessed with the use of a simple, one-item measure. Specifically, participants in a social exchange are asked: Considering what you put into your organization, compared to what you get out of it … and what your _____ (supervisor, fellow workers, etc.) put in (compared to they get out of it), how does your relationship "stack up?"

Respondents are given the following response options:

+3: I am getting a much better deal than _____.
+2: I am getting a somewhat better deal.
+1: I am getting a slightly better deal.
0: We are both getting an equally good, or bad, deal.
−1: My _____ is getting a slightly better deal.
−2: My _____ is getting a somewhat better deal.
−3: My _____ is getting a much better deal than I am.

On the basis of their answers, persons can be classified as over-benefited (receiving more rewards from the organization and suffering fewer costs than they deserve), equitably treated, or under-benefited (receiving less and sacrificing more than they deserve). It turns out that the "official" measure is highly correlated with this simple measure, which turns out to be a reliable and valid measure of perceived fairness and equity (Young and Hatfield 2011).

## Classic Equity Theory Research

In the 1960s and 1970s, Equity researchers conducted a plethora of studies designed to test Equity theory in organizational and business settings (see Hatfield et al. 1978). At the time Equity theorists began their work; the prevailing assumption was that businessmen and employees were economic beings who delighted in profit, the bigger the better. It is not surprising then that in attempting to apply Equity theory in organizational settings, researchers focused on two major themes: (1) How important are perceptions of justice in organizational settings? Do *employers* really care whether or not their workers are fairly treated? (Or in capitalism, is profit king?) Do *employees* really care whether or not they are fairly treated? (Or are overpaid workers perfectly content with their lot? Is it only underpaid workers who long for justice?) (2) How concerned are

managers/workers with setting inequities right – either by restoring actual equity, justifying the inequity, or punishing wrongdoers? Let us consider some of the voluminous research industrial psychologists conducted in their attempt to answer these questions.

## Do People Really Care About Equity?

Social scientists provide compelling evidence that men and women feel most comfortable when their relationships are both profitable and equitable. When people are profiting from their work and know they are receiving just what they deserve in status, money, and services, they feel "content" and "happy." When receiving considerably more than they deserve, they feel "shame," "guilt," and "unease" (Peters et al. 2008). When receiving far less than they deserve, people feel "angry" and "resentful" (see Hatfield et al. 1978 for a compendium of this research).

## Do Employers Care About Equity?

Leventhal (1976) attempted to find out *why* employers are motivated to behave in a fair and equitable way. In other words, he was interested in exploring why they feel most comfortable when they are treating their employees fairly. His argument went as follows: Probably few businessmen follow equity rules because they are committed to an abstract ideal of equity and justice. They follow equity rules because there is a payoff for doing so, both for themselves and their company. Leventhal investigated several "payoffs" that employers reap from equitable behavior. These include: Conforming to business world norms, attracting superior workers to the company and weeding out inferior ones, motivating workers to produce, and avoiding conflict.

Anytime a manager sets himself up as a judge of other men's worth, he can expect to encounter trouble. The task is hard enough when his decisions are fair; woe to the manager whose decisions are unfair. One reason, then, that employers treat employees fairly is their desire to maximize harmony and minimize dissention. But how to do this? Yuchtman (1973) observed that personnel managers and workers often disagree as to what is fair. For example, Yuchtman found that managers in small factories preferred pay systems based on merit, while their workers preferred a more equal division of resources. Leventhal et al. (1972) found that the more employers valued harmony, the more likely they were to switch from an equitable allocation of resources to one that they thought would satisfy the men – namely, to divide resources equally.

## Do Employees Care About Justice?

By far the most provocative (and voluminous) research in the industrial area has dealt with the other half of the coin: the *employees'* reactions to equity and inequity.

One of the earliest industrial psychologists to observe that perceived injustice provokes dissatisfaction was Jaques (1961). In a study of British factory workers, Jaques found that underpaid workers showed "an active sense of grievance, complaints, or the desire to complain, and . . . an active desire to change jobs." But more interestingly, he found that overpaid workers were distressed too; they showed "a strong sense of preferential treatment . . . with underlying feelings of unease."

Subsequent experiments supported Jaques' observations. One especially impressive study was conducted by Pritchard et al. (1972). The authors recruited 253 Minnesota men to work for their temp firm, "manpower." The men were hired men to work as clerks for 1 week at an equitable salary ($12.20 in today's dollars). After the men had begun to work, their dismayed employer ruefully revealed that the recruitment flyers had been in error, that he could (could not) remedy this, and that as a consequence they would be overpaid, equitably paid, or underpaid. Later, men were asked to express their feelings on the *Minnesota Satisfaction Questionnaire* (MSQ) and the *Job Description Index* (JDI). The *MSQ* measures men's satisfaction with their pay, their recognition, their general working conditions, and the

extent to which their job uses their abilities. The *JDI* measures men's satisfaction with work, supervision, pay, and promotions. The results were clear (see Fig. 1). Equitably treated men workers were more satisfied with their working conditions than were either overpaid or underpaid men. Additional evidence that equitably paid workers are more satisfied than their peers comes from a variety of sources (Hatfield et al. 1978).

## There Are Many Kinds of Justice

Surprisingly, whether people are generally more concerned about justice or profit in work settings is still up for debate. (For a meta-analysis of perceptions of justice in business settings, see Skitka et al. 2003. They found that in work settings, outcome favorability is generally considered to be less important than outcome fairness!).

## Restoring Equity

Once the fact that employers and employees care about equity was established, organizational psychologists proceeded to tackle their second question: How do inequitably paid workers handle their feelings? According to Equity theory, the three strategies available to them are the restoration of actual equity, the restoration of psychological equity, and leaving the field. An impressive body of literature indicates that inequitably paid workers seem to do all three.

## Restoring Actual Equity

In the 1960s, Adams and his colleagues, in a series of elegantly simple studies, excited a revolution in organizational research. Adams proposed the unthinkable: that capitalistic American workers care about equity and that the desire for a fair wage will affect their work. Adams and Rosenbaum (1962) pointed out that according to Equity theory, (1) employees who realize they are being overpaid or underpaid should feel distress; (2) such workers can restore actual equity by altering either the quantity or the quality of their work. Then, the authors made an ingenious prediction; employees who are paid on a salary or hourly basis versus a piece-rate basis can restore actual equity in very different ways. The overpaid worker who is paid on a salary or on an hourly basis can restore equity by increasing his inputs; he can produce more work and higher-quality work. An underpaid worker can restore equity by doing the opposite; he can produce less and lower-quality work. The worker who is paid on a piece-rate basis, however, must follow a very different strategy if he is to set things right. An

**Equity Theory of Organizations, Fig. 1** Satisfaction with the workplace and equitable treatment. (From Pritchard et al. (1972))

overpaid piece-rate worker can only restore equity if he produces less work of a higher quality. An underpaid piece-rate worker can restore equity by doing just the opposite; he can produce more work of a lower quality.

In a number of studies, authors hired men for an interviewing job. They made some men feel overpaid, others equitably paid, and others feel underpaid by commenting on their qualifications. The results of these studies were exactly as Adams and Rosenbaum (1962) had predicted (see Adams and Rosenbaum 1962; Lawler and O'Gara 1967 for more information).

## Observers' Reactions

Many studies have found that observers are willing to suffer significant costs to administer punishments to third parties who behave selfishly on group tasks (Gintis et al. 2003; Price et al. 2002). In summarizing one study, for example, Wilson (1993) observed:

> . . . our sense of justice . . . involves a desire to punish wrongdoers, even when we are not the victims, and that sense is a "spontaneous" and "natural" sentiment. (p. 40)

People don't always try to set things right, however. In life, we see people perfectly happy with the fact that they make more than they should. Rich people sometimes assume they must be smarter than their "loser" peers. They may also believe that the poor are just lazy or welfare moochers who are looking for a handout. A great deal of fascinating research has demonstrated that it is easier to convince oneself that this is a fair and just world – especially if you are the beneficiary of the world's largesse.

## Justifying Injustice

All people may be concerned about fairness in the workplace, but culturally and historically societies have had very different visions as to what constitutes "social justice," "equity," and "fairness" in social and business relationships. In a telling example, the Assembly in New England in the 1640s passed a series of resolutions on the Indian question:

1. The Earth is the Lord's and the fullness thereof. Voted.
2. The Lord may give the Earth or any part of it to his chosen people. Voted.
3. We are his chosen people. Voted. (Reported in Mason 1971, p. 242).

Probably all of us are inclined to define "justice" and "fairness" in a self-serving way. There is considerable evidence that harmdoers tend to deny responsibility for their cruel acts ("My boss made me do it,"), minimize the victim's suffering ("He'll soon find another job"), and to blame the victim ("He probably deserved it") (Brock and Buss 1962; Sykes and Matza 1957).

In an experiment by Davis and Jones (1960), researchers found that people who were recruited to insult other people (as part of a research project) generally ended up convincing themselves that the victim deserved to be ridiculed. Sykes and Matza (1957) found that juvenile delinquents often defend their victimization of others by arguing that their victims are really homosexuals, bums, or possess other terrible traits that make them deserving of punishment. In injuring others, then, the delinquent can claim to be the restorers of justice rather than harmdoers.

The same sort of process has been found to operate in corporations. In the Adams study, described earlier, when temporary workers *first* discovered they were being over or underpaid, they felt concerned and would set out to remedy things. But what would happen if the inequity were to continue? With time, the overpaid workers would surely begin to wonder why, if he was so unqualified, his employer didn't fire him and hire a better worker. With time, the underpaid worker would be forced to ask himself why, if he was really so underpaid, didn't he quit and go elsewhere. The question of how overpaid/equitably paid/underpaid workers react over time is a fascinating one. Luckily, it is a question that has been addressed. Scholars find that although workers' immediate reaction is generally to try to set things right, over time workers tend to

justify the status quo (Gergen et al. 1974). This means that eventually, workers will accept and rationalize inequality they have caused or experienced, which thus causes inequality to continue without further resistance.

## Leaving the Field

In the preceding cases, job applicants had already reported to their jobs or were busily engaged in working on their jobs when they discovered they would be equitably/inequitably paid. In life, however, both employers and employees have additional options. They must continually decide whether they want to continue working or to sever their relationship. The employer can keep an employee on or he can transfer him or fire him. The employee can accept his working conditions or he can withdraw psychologically (coming in to work late, or not at all), request a transfer, or simply quit outright. Not surprisingly, when inequities loom large, people often voluntarily withdraw from the situation. Interestingly, researchers have found that workers often engage in actions that seem "seriously irrational" from an economic point of view. For example, in a study by Schmitt and Marwell (1972), participants were offered a choice between a job offering low pay, where they worked alone, and a job with a far higher wage where their coworkers would make significantly more money than them. Interestingly, participants often chose the low-paying (but equitable) job over the higher-wage (but inequitable) job! For a compendium of the voluminous evidence in support of these propositions, see Hatfield et al. (1978).

Today, scholars have begun to compare and contrast people's concern with various forms of justice: equity, distributive justice, procedural justice, interactional justice, restorative justice, and retributive justice (Witvliet et al. 2008). Researchers find, for example, that academics consider procedural justice (the procedures that are used to distribute rewards) to be extremely important – more important than the actual amount of pay they receive (Skitka et al. 2003; Terpstra and Honoree 2003). This research must wait for another paper, however.

## Recent Research

### What Is the Source of Humankind's Concern with Justice?

In recent years, scholars have begun to focus on the question: "Why are people in almost all known cultures concerned with social justice and with fairness?" All religions consider the Golden Rule ("Do unto others . . .") to be the bedrock of faith. In the Abrahamic religions – Christianity, Judaism, and Islam, for example, true believers are told that God created the world and decreed that people must be just in their dealings with others (Webley 1993). In their scriptures, all three religions argue that in commercial transactions, true believers must abjure fraud and cheating, abstain from bribery, and avoid discrimination (Quddus et al. 2009). Of course, people don't always live up to these ideals.

What is the genesis of the conviction that people must behave fairly and equitably in their social and business relationships? In the 1960s and 1970s, social psychologists focused mainly on socialization, social reinforcements, and market considerations (profit and loss) in attempting to explain why people come to care about equity (Hatfield et al. 1978; Krebs 2008; Skitka and Crosby 2003).

Recently, however, scholars have discovered that the desire for justice may well have far more ancient roots than they once supposed: (1) cultural researchers point out that in different societies – although people often possess somewhat different notions as to what is fair and equitable – all share the belief that others should be treated equitably; (2) evolutionary psychologists and primatologists argue that a concern for justice arose early in humankind's evolutionary history because such concerns had survival value. They also contend that this ancient cognitive "wiring" shapes modern-day definitions of what is fair and just; (3) neuroscientists study the cognitive reactions to perceived fairness and equity and find that a concern with fairness and justice may be hardwired in the brain. It is clear from this more recent research that culture, our evolutionary heritage, one's own experience, and our biological wiring all impact

people's perceptions of fairness and equity and how they choose to deal with perceived social, procedural, and distributive justice or injustice.

## Equity: A Cultural Perspective

Cultural theorists contend that culture exerts a profound impact on the ways in which people conceptualize the world around them, the meaning they ascribe to common life events, and the manner in which they react to those events (see Markus and Kitayama 1991; Nisbett 2003; Schwartz 2004; Stephan and Stephan 2003). Not surprisingly then, cultural researchers have asked: "Is Equity theory applicable to all people in all cultures and in all historical eras?" (Amir and Sharon 1987; Murphy-Berman and Berman 2002).

Many would answer: "No." Triandis and his colleagues (1990), for example, argued that in individualistic cultures (such as the United States, Britain, Australia, Canada, and the countries of northern and western Europe), people tend to focus on personal goals. No surprise, then, that in such societies, people are deeply concerned with how rewarding (or punishing) their commercial relationships are and how fairly (unfairly) they are treated. Collectivist cultures (such as China, many African and Latin American nations, Greece, southern Italy, and the Pacific Islands), on the other hand, insist that people must subordinate personal goals to those of the group: the family, the clan, or the tribe. It is tradition, duty, and deference to elders that matters.

There is considerable evidence that culture shapes people's concern with profit, harmony, need, merit, fairness, equality, and equity in the allocation of resources (Chhokar et al. 2001; Mintu-Wimsatt 2005). In spite of these differences, in all cultures, people are concerned (at least to some extent) with both the profit and the fairness of their social and business relationships (Westerman et al. 2007).

The most comprehensive work done on cultural differences in perceptions of fairness, equity, and various forms of justice comes from Powell (2005) and his colleagues. Powell studied people's cognitive maps when thinking about fairness in more than 40 types of social groupings (such as gender, age, class, and occupation) and in more than 20 cultures (such as India, South Africa, Jamaica, and the like). He asked:

1. What do individuals and collectivities think is just and why?
2. How do ideas of justice shape determination of actual situations?
3. What is the magnitude of the perceived injustice associated with given departures from perfect justice?
4. What are the behavioral and social consequences of perceived injustice? (p. 15). (See also Jasso 2005.)

As you might expect, Powell found that in different cultures, people possess very different ideas as to what is fair and equitable in social and business relationships. These findings suggest that equity will consist of different criteria based upon the culture within which it operates.

### Equity: The Evolution of a Cultural Universal

In the past 25 years or so, evolutionary psychologists have become interested in the underpinnings of morality (Krebs 2008), focusing primarily on humankinds' desire for social justice and fairness and equity in social exchange. Cosmides and Tooby (1992), for example, observed:

> It is likely that our ancestors have engaged in social exchange for at least several million years. . . Social exchange behavior is both universal and highly elaborated across all human cultures – including hunter-gatherer cultures . . . as would be expected if it were an ancient and central part of human life. (p. 164)

They argue that notions of fairness and equity came to be writ in the mind's "architecture" because a concern with social justice possessed survival value (Tooby and Cosmides 1996). Further, a concern with social justice, in all its forms, is alive and well today because fairness in social and commercial relations remains a wise and profitable strategy. People are good at identifying those who behave fairly in commercial exchanges versus those who do not. Selfish individuals are often shunned and ostracized – a potentially lethal punishment within a social species. (For a further

discussion of these points, see Hatfield et al. 1978; Jost and Major 2001; Krebs 2008).

Today, paleoanthropological evidence supports the view that notions of social justice and equity are extremely ancient. Ravens, for example, have been observed to attack those who violate social norms. Dogs get jealous if their playmates get treats and they do not. Wolves who don't "play fair" are often ostracized – a penalty that may well to lead to the wolf's death (Bekoff 2004; Brosnan 2006).

Primatologists have amassed considerable evidence that primates and other animals do care about fairness. In a study with brown capuchin (*Cebus apella*) monkeys, Brosnan and de Waal (2003) found that female monkeys who were denied the rewards they deserved became furious. They refused to continue to work for reward (refused to exchange tokens for cucumbers) and disdained to eat their "prize" – holding out for the grapes they knew they deserved. If severely provoked (the other monkey did nothing and still got the highly prized grapes), capuchins grew so angry that they began to scream, beat their breasts, and hurl food and feces at the experimenter. Interestingly, in a later study, the authors found that chimpanzees *(Pan troglodytes)* were most upset by injustice in casual relationships. In chimps' close, intimate relationships, injustice caused barely a ripple. Often, chimps would simply hide their grapes and pass them out to intimates who were more deserving when they left the experimental setting (Brosnan et al. 2005). In nature, family members often try to "set things right" in subsequent interactions. We see, then, that different species, in different settings, may respond differently to injustice in a work setting.

Potentially, this fascinating animal research may provide some insights into three questions that have intrigued equity researchers: (1) when, in primates' long prehistory, did animals begin to feel "guilty" about receiving "too much," as well as feeling outraged when they are "ripped off?"; (2) are animals more (or less) concerned about fairness in despotic, hierarchical societies than in those that are in relatively equalitarian communities?; (3) are primates and other animals more (or less) concerned about inequities in close kin relationships than in more distant encounters? (Brosnan 2006).

### Equity: A Neuroscience Perspective

Recently neuroscientists have begun to explore people's sensitivity to moral issues in commercial settings, using a compendium of state-of-the-art fMRI, EEG, and chemical assays (Borg et al. 2006; Raine and Yang 2006; Robertson et al. 2007; Tabibnia et al. 2008). Tabibnia and his colleagues (2008), for example, used fMRI techniques to study how people react when faced with a conflict between financial interests and fairness. The authors examined self-reported happiness and neural responses to fair and unfair offers while controlling for monetary payoff. Compared with unfair offers of equal monetary value, fair offers led to higher happiness ratings and activation in several reward regions of the brain. The tendency to accept unfair proposals was associated with increased activity in the right *ventrolateral prefrontal cortex* (a region involved in emotional regulation) and decreased activity in the *anterior insula* (which has been implicated in negative affect). This suggests that on a neurological level, individuals who are coping with unfairness show increased emotional regulation in efforts to control negative emotions that have been brought about by injustice. This corroborates the argument that there may be biological wiring that encourages us to behave in fair and just ways.

## Conclusion

Work on Equity theory has come full circle. In the 1950s, Equity theory began by attempting to predict the productivity of supervisors and workers in organizational settings. Then scholars became interested in predicting how men and women's romantic relationships would be initiated, maintained, and terminated as a consequence of their equity or inequity. Now things have come full circle. Equity theorists have returned to an interest in organizational settings.

In this paper we reviewed classic Equity theory, the new research documenting that observers, employers, and employees do indeed care about

injustice, and the attempts people make to restore actual equity, psychological equity, or if all else fail to leave the field. We also reviewed research investigating why humankind is concerned with justice and the impact of culture on perceptions of equity.

## Introduction

The budget management process in each country shows how and which activities are performed by the government and this administrative financial document is set up to guarantee a set of preferred goals can be achieved during a fiscal year. This document also contains budget macro-information about various governmental sectors. The budget document, in the form of law, must have the characteristics which could actualize the economic policies developed by the state. In other words, governmental policies should be reflected in the budget so that their implementation leads to

the attainment of desired goals. The budgeting management in Iran has been traditionally developed based on a cost-oriented framework which generates a number of challenges like dysfunctional stability. In addition, the budgeting in Iran suffers from a couple of other issues such as (a) the imbalanced reliance of the budget on oil revenues, (b) lack of interest for long-term investments, and (c) the involvement of the actors who have inadequate technical expertise and contextual knowledge about the nature and process of budgeting.

In the classical approach to budgeting, an important controlling subsystem, called settlement of the budget, is considered to assure the performance of the totality of the budget (Carroll et al. 2012). In relation to this subsystem, one major challenge in Iran in the development of a proposal for the settlement of funds is that the budgeting process is weak in terms of revenue forecast and estimating costs. Consequently, the budget bill settlements are not prepared in time to be submitted to the State Audit Court and then the Islamic Consultative Assembly. Hence, in accordance with Article 55 of the Constitution of the Islamic Republic, it brings about lack of effective regulatory oversight by the legislature over the executive (Nikoukar et al. 2016).

It has been discussed that the relationship between responsiveness and performance is full of tension, ambiguities, and contradictions and greater responsibility for performance do not necessarily lead to more accountability for the performance (Christensen and Laegreid 2015, 10). Therefore, this entry attempts to develop a pathological view by which these specific challenges in the Iranian budgeting era. Also, this entry seeks to provide an operational platform on which a special administrative instruction is developed to modify budgeting practice in Iran based on its own specific contextual variables.

## The Development Trajectory of Budgeting in Iran

One of the core activities of any government is to prepare and plan for its income and expenditures, i.e., budgeting, and the Iranian government is not an exception. However, it seems that this task has been remained in its basic forms and hence produces critical challenges on the practical level. Historically, Iranians have had expertise in statecraft and forming bureaucratic offices and getting ransom, tribute, duties, and implementing fiscal discipline. While many nations have learned bureaucratic stages of affairs from the Iranian, there is almost no systematic investigation and research on the actual processes of the ancient economy and financial system of Iran (Olmstead 1959; Durant and Durant 1993; Briant 2002). There is a historical and evolutionary path in which the budgeting practice in Iran has been exercised and developed: In primitive societies, including ancient times and the feudal states, there were almost no specific models for budgeting. Instead, personal authorities' opinions used to determine both the structure and content of the budget. Over time, this chaos gradually transformed into the form of a compiled plan which was maintained and reorganized under the King's Counsel. The integrated plan, however, was somehow unstable but the form and amount of taxes and government expending in the form of the treasury had set up in.

One of the most significant developments in Iranian budgeting system happened during the Persian Constitutional Revolution (1905–1911). As the result of that political transformation, a new method of budgeting was organized following conventional views on the practice budgeting at its own time. Those classic methods were the reflection of the government's income and expenditure figures. Practically, the budget was produced in relation to two critical dimensions; first, organizational units and second their estimated cost. Because of the nature of this method, members of the public had no idea of the exact spending and income of the government and hence the lack of effective monitoring and control.

The next major development in Iranian budgeting systems happened when international expertise was utilized. Not surprisingly, the role of external forces such as international advisers and policies developed by International Monetary Fund has structurally changed the process of financial affairs, including budgeting, in developing countries.

In line with early developments in Iranian budgeting system, William Morgan Shuster, an American lawyer, came to Iran as the first official external expert. The underlying intention was to reorganize the whole financial situation of the Iranian government in 1911. However, due to political crises and the Russian government ultimatum, Morgan was forced to leave the country just after 8 months. After a decade, in 1922, Dr Arthur Chester Millspaugh, who was a former adviser at the US State Department's Office of the Foreign Trade, traveled to Iran with a similar mission that of Schuster. He and his team defined and implemented a chain of executive actions to design a working new budgeting system for the country. The legacy of his efforts in changing Iranian budgeting system has been seen as a closure to the traditional budgeting in the country. The most crucial aspect of the Millspaugh-initiated system was making a separation between agricultural and rural revenues. In fact, this changed the whole structure of the budgeting system.

The period from 1925 to 1941 is considered as the formation of a new system for Iranian budgeting. At that time, the role of oil revenues was not minimal in the government budget and was mainly used for ancillary costs. The Iranian budgeting system evolved in around 1939 and 1940. For the first time, the budgetary information was released with exact details, i.e., 70 different columns. Following this evolution, a new chapter began in the budgeting system since 1953. In fact, the budgeting system extended in response to new sources of incomes: first, the loans and grants offered by the US and UK government and second, the increasing role of oil revenues in the budget. On the other hand, dozens of new developmental programs were started. Such events provided the budget with an improved perceived importance and ultimately in 1966 a major structural political reorganization shaped: the Ministry of Assets had no longer a direct responsibility for proposing the Iranian budget and instead this task became an added responsibility for the prime minister. As the result, the Budget Office was established in the Planning Organization in fulfilling this new responsibility. Since 1973, the preparation of the National Budget became the responsibility of Planning Budget Organization and all financial and treasury matters centralized at the Ministry of Finance.

In 1965, the Iranian budgeting system took another step forward to get closer to a modern budgeting system. With the help of United Nation, the common budget became program budget in which the government's programs and operations were fully reflected and this provided people and their representatives with improved monitoring. However, over the course of almost three decades, the program-oriented budgeting system was unable to respond novel challenges triggered by changes in all aspects of the economic, social, and political sphere. In 2002, a new idea developed in response to these growing challenges. A new system, called as operational budgeting, was adopted to allow effective planning and economic management. Yet, for various practical and political reasons, this new system proved to be unsuccessful in practice.

E

## Challenges and Shortcomings of Budgeting System in Iran

In the last almost 70 years, the Iranian budget has been prepared and implemented based on the financial-legal frameworks which are common to most parliamentary-oriented countries. However, the budgeting process and the final budget appear as one of most annoying challenges in the domain of public administration. There are different lenses through which we could study and analyze this issue, from political to economic and cultural sources of the challenge. From the practical point of view, however, the challenge has its roots in the budgetary structure as well as the administrative organization of the state, especially when it comes to fiscal stability. In this regard, the most important issues and problems in the current Iranian budgeting systems can be briefly classified as follows:

- Currently, the whole spirit of the administrative system of the country is to maintain its own organizational entity. As a result, the budget is not prepared to respond to designed objectives and actual responsibilities. Accordingly, the current and development credits take the form of a closed and uncontrollable package and this prevents the optimal allocation of the credits.

- The second issue is related to the imbalanced role of the capital (i.e., Tehran) and other larger cities in the public administration. Such focus limits the scope of creativity and kills confidence among local officials.
- There are at least two immediate challenges in relation to the fact that Iran is an oil-producing country: First, there is a limited motivation to establish and maintain a meaningful linkage between governmental revenues and infrastructural capacity to produce goods and services. Second, since the oil is an exogenous factor in the budget, the final budget of the country takes a shape which the government has almost no control on it.
- The excessive expansion of the government and the complexities associated with big government do not allow an effective and proportional distribution of the resources among various sectors.
- According to the law, developmental projects funds must be ratified in the form of executive programs. However, in practice, due to the lack of such programs, the credits for executive agencies are ratified in the mixed subsections of current and fixed investments. Moreover, there is an unresolved confusion over the exact definition of developmental projects and how such projects should be designed and evaluated.
- The budget control is currently done largely by the Court of Auditors and just at the discretion of the authenticity of documents. Also, there is not a regular reporting system in place. In overall, the budget control mechanism in Iran is not an alive and dynamic one and this contributes to the gap between designed and implemented activities.
- Lack of fiscal discipline is another problem in Iranian budgeting system. That is the budgeting system follows a kind of top-down logic; the budget of each sector is to large extend determined on the basis of its perceived political importance, bargaining power and the quality of its senior executive's portfolio. Such factors play a great role in the process of developing the final budget and hence this leaves a limited space for the relevant expert opinions in the budgeting system. The fiscal instability and disorder are reinforced in the absence of knowledge-based allocations.
- In the current system of budgeting, there is almost no consideration and practical guidelines to connect the organizational and financial efficiency to the allocating credits.
- There is a portfolio of practical problems which together leads to an increasing dependency on oil revenues in the budget. For instance, the lack of coordination among resources of the budget on one hand and the increasing demand for budgetary resources which enable the state to perform its growing duties in social, economic, and power sectors on the other hand. Also, the existence of a wide range of tax exemptions is not supportive to liberate the budget from the oil.

## The Need for Change in Iranian Budgeting System

Since the actual problems of each developing countries are locally shaped and highly context-specific (Sako and Ogiogio 2002; Szirma 2005), the generic models and guidelines might not be useful to understand and resolve their challenges. These problems and challenges are context-specific and hence when it comes to resolve them, any country should be considered as a specific case. Then, its own unique social, economic, technological, and geographical context will find a better role in discovering, analyzing, and resolving the problem (c.f. Kia 2008). The realization of the importance of the contextual factors and local knowledge has informed a new form of practical tool: adopting a pathological approach towards specific challenges in the Iranian budgeting system and attempting to develop a special administrative instruction for the policymakers and practitioners. In short, this research is inspired by the empirical observations of the everyday fiscal problems.

The Iranian budget process has been traditionally carried out in the following phases: (a) preparation, arrangement, and proposition of the budget (i.e., the proposal phase), (b) getting the approval for the proposed budget (i.e., the approval phase), (c) implementation of the approved budget (i.e., the allocation phase), and

(d) monitoring and controlling of the implementing budget (the settlement phase).

At the core of the abovementioned process is a kind of information-oriented framework: in this method of budget policy relevant pieces of information are received from different units. Then, based on results from bargaining between the representative and the Representative of Office of Budget they are prioritized. Finally, a detailed list of income and expenditure is complied. Thus, the existing budgeting system can be seen as a simple information system in which the received information are straightforwardly processed, classified, and recorded. The major shortcoming of such approach is that when the budget is formulated there would not be a functional obligation to its implementation, excluding those cases in which a high-rank official with considerable administrative power is determined to see the progress and outcome of a specific program.

The lack of commitment to the implementation of the budget results in the policy failure and desired outcomes will not be achieved (c.f. Howlett et al. 2015; McConnell 2015; Kay and Boxall 2015; OECD 2000). Under such circumstances, the budget does not meet its objectives and large parts of that remains as incomplete. This means the managerial failure and inadequacy in the programs associated with the budget. Hence, with continuous support from oil-related financial resources, the incomplete programs are extended with additional funds. Such out-of-the-plan activities create an arena of time and financial debt in the structure of the budget, and the budget is locked to maintain its status quo. This adhesion in the sediments in budgeting process makes the budget system always in debt and unnecessarily dependent on the past (unsuccessful) performance (Fig. 1).

The undesirable outcome of such adhesion is the limited quality of the implemented developmental and current programs and hence the members of public (final users of the planned services) develop a sense of mistrust and ill-productivity. In the similar vein, from the providers' point of view, the continuation of unsuccessful budgets strongly influences their self-confidence and understanding of the notion of success.

The practical observation and the analysis of speeches suggest that there is very limited role of the performance and accomplishment in defining and perceiving "success" and this notion has been politicized to some extent. In the absence of a functioning administrative system, "being a successful manager" is largely associated with sustaining the existing organizational hierarchies and relations. In short, the intention to reform and modification disappears and is replaced by the motivation to dysfunctional stability. The analysis of this challenge and the reasons behind that has been a constant concern of many practitioners and policymakers. Using various sources of empirical data

**Era-Based Budgeting System: Lessons from Budgetary Policy Failure in Iran, Fig. 1** The existing budgeting vicious cycle in Iran

such as exploratory seminars, focus groups, and organizational newsletters, we hear a number of repeating concluding ideas: (a) there is a problem in the current administrative system, (b) the absence of experts and relevant merits in the shaping of the existing system, and (c) the fact that such problems are constantly regenerated as the result of wider historical cultural dysfunctionality in the domain of public administration. While useful at the level of discovery, these thematic conclusions offer limited practical insights since they are excessively general and hard to be operationalized. In addition, they somehow discourage innovation and make it inclined to accept the existing situation. The result of this vicious cycle of "pain and poor treatment" has been traditionally to internalize the dysfunctional stability and the increasing spirit of undesirable reality which should be only accepted and played out.

The budgeting system is supposed to follow a firm and well-designed rationale which in turn could make a functional platform for improved financial decisions. The appropriate allocation of the resources enables any administrative system in achieving its objectives and hence an enhanced motivation among different units. The Iranian budgeting system, however, seems to be challenging and dysfunctional in a sense it is not supportive to the totality and quality of the services provided by the government. Hence, there is a growing interest among academics and policymakers for making a transformation in the current budgeting system.

As mentioned earlier, one critical deficiency is the lack of meaningful connection between the allocation of the funds and the performance. Hence, it has been argued that the development and elaboration of such critical connection should be at the core of the transformational change in the existing system. That is, the allocation of the funds should be in relation to the performance. Having this in mind and considering the financial constraints of a developing economy, the continuity of the funding is merely made possible when the performance of the last step is evaluated and approved. Such step-by-step approach makes the budgeting framework sensitive to the decisions and activities that might result in its failure in accomplishing the objectives. To define and apply a working step-by-step approach towards the budgeting framework, there is a need for novel methods in which the allocation is more flexible and also there is a recognizable consideration for unpredictable events. In the next section, we propose a scenario-based thinking would be a useful way to transform the existing traditional budgeting system in Iran.

## Scenario-Based Approach on the Budgeting

Learning from the challenges associated with the Iranian budgeting system, we propose a model, called ear-based cellular planning (ECP), in which the budgeting process is rearranged based on a set of scenarios in different eras. Each era is conceptualized as a specific period of time in which similar concerns, terminologies, and conditions are recognizable. In this line of thinking, each scenario is an independent part of a complex and extensive budgeting system. Thus, the final budget document includes a number of related or unrelated substantial scenarios.

To use a practical managerial lens, there are two fundamental bases on which the "related scenarios" (i.e., a package) can be classified: first, simultaneous and second sequential packages. As for the horizontal or simultaneous packages, there are those related scenarios which need to be performed at the same time. As for the vertical or sequential packages, they highlight those related scenarios which must run on a sequential order (i.e., they are consecutively performed one after another). In this specific line of reasoning, the implementation of the scenarios needs considerations that constitute a basis for embedding a monitoring (watch-up) subsystem.

To be better elaborate the proposed scenario-based thinking, it might be useful to reassign the modification of the budgeting system in the light of a metaphorical comparison. We think budgeting as missiles systems and hence our proposed budgeting system is more like Phoenix rather than Tow missiles. Phoenix missiles can automatically follow the objective to reach it whereas Tow missiles, when launched, need the direct and constant human intervention to reach

their target. As similar to Phoenix missiles, the idea is to maintain a kind of "budgeting support system" within which flexibility and commitment to the objectives are combined and balanced. The core affordance of this analogy is to underline the necessity for developing vertical packages in the scenario-based planning model: while there is an initial ordering (serious commitment to the goal), potential obstacles require temporal and occasional modification in the designed sequence.

In short, the proposed era-based cellular planning system empowers planners and executives to manage an extensive number of scenarios, the scenarios which are associated with different ears (i.e., ages) when are performed in the specific sequential order. Moreover, the constant temporal revisions are made possible through the development and adoption of a dynamic monitoring subsystem. In the next section we elaborate the significance and functionality of this dynamic system.

### The Crucial Role of Dynamic Monitoring

Environment is paradoxically the source of challenge and energy for organizational entities. The key question is then how to effectively interact with the (ever-changing) environment. The literature on management and organization reveals that the existence of a platform for continuous mobilization of the organizational resources is crucial to such effective interaction. Furthermore, there are at least five subsystems that are necessarily constitutive to this platform, its creation, and maintenance:

- First, the subsystem of the "problem-finding" and observing the environment. The design of this subsystem enables planning and executing agents for the continuous environmental observation and the discovery of potential problems. The point is that such problems and issues cannot be simply taken as stable but they constantly change in form and quality. To be more specific, these issues are always subject to increasing complexity and diversity. In the real world, fresh issues are added to the existing ones. This typically happens in two ways: first, the existing problems find new dimensions and hence become more complex and widespread; and second new categories of the problem emerge and consequently reshape the dynamics of the plan. As the result, this specific subsystem needs to be designed in a way that could capture, analyze, and prioritize the developing challenging signs associated with the organizational environment.
- Second, the "policymaking" subsystem. This subsystem is a kind of responsive mechanism to the problems discovered and ordered in the previous stage. To deal with the emerging challenges, this subsystem is utilized for adopting and formulating appropriate policies. The classic practice is to develop one specific policy against each identified problem. However, in dynamic policy-oriented frameworks, in which era-based model is a proposed example, knowledge management systems are used and embedded to generate a set of potential and alternative policies. This knowledge-oriented flexible approach enables policymakers to adopt the policy based on contextual analysis. To use ear-based planning vocabulary, a number of alternative scenarios are generated and maintained. Which scenario to be activated is defined in the collaboration with the watch-up subsystem which will be explained next.
- Third, the "watch-up" subsystem. The core task of this subsystem is to observe and analyze the implementation context of the selected policies and make sure the most appropriate combination (i.e., scenarios) is performed. The application of this subsystem closes the gap between practical and theoretical outcomes of the policies identified and selected in the last stage. This subsystem is initially based on the already-generated policies; however, it can also call for more fundamental changes such as reconfiguring the current policies portfolio or calling for novel scenario-oriented policies.
- Fourth, the "administrative" subsystem. In this subsystem, we become closer to the level of practice and implementation. While this subsystem is closely connected to the watch-up subsystem, it concentrates on the day-to-day life of the implementing policies. In the classical approaches, there is almost no chance to change the selected policies over their course of implementation when relevant practical

guidelines are adopted. However, in more dynamic approaches, revising the policy-in-progress is seen as a resourceful opportunity. As explained earlier, since such novel approaches are based on knowledge management systems thinking (and the fact that knowledge is ever-developing), they are open to revise and replace those policies that are not appropriately selected and implemented;

- Fifth, the "evaluation" subsystem. This subsystem communicates with the performance of the system. Its main task is to make sure the final result of the system meets its defined goals. Traditionally, this is conducted when the implementation phase reaches to its end. However, in more dynamic, flexible approaches, the assessment is continuously performed in parallel and coordination with the implementation and watch-up subsystems. As it becomes clear, such subsystems are more like different layers of the same practice and do not follow the one-by-one logic.

From the practical point of view, in the dynamic approaches such as ear-based cellular planning model, an openness is encouraged and developed to terminate and replace an inappropriate policy-in-progress. In fact, even the majority of policy is conducted and it is very close to its defined end-point, the implementation would be terminated to prevent the completion of an inexact project. The vital consequences of this openness show the importance of well-functioning watch-up and evaluation subsystems. They have to be designed in a way to be sufficiently sensitive to both macro and micro events and to responsibly monitor the operation and progress of the implementing policy. They guarantee the coherence of the selected policies and associated programs and their actual capacity for achieving the designed goals.

To conclude, the most innovative transformation in this dynamic approach is a move from a liner process of policymaking to a kind of cellular one. While in the traditional thinking, four steps of environmental monitoring, policy making, implementation, and evaluation are conducted in a sequential order, the new proposed ear-based planning model, firstly, adds the watch-up subsystem as an important practice and, secondly, reorients the focus from the sequentiality of the steps to their internal coordination and simultaneous multilayered-ness (Pourezzat et al. 2012b).

## Era-Based Cellular Planning: Characteristics and Rationale

We propose and develop the era-based cellular planning model as a response to the challenges associated with the unplanned future events. Hence, this model has become plastic and flexible in its nature. This flexibility has its sources in the cell-based structure of the planning model. Its cellular design and its reliance on the completing knowledge allow the revision in the implementing policies and selected future programs and even it enables the management of the unintended consequences of the past programs. As mentioned earlier, this planning system follows and traces recent developments in science and technology to increase the knowledgebase on which it operates.

The cellular structure of this system creates conditions under which the so-called future becomes less dependent and is less affected by the existing and past programs and plans. In this model, the aim is to lessen the sequentially ordered chains of problems and failures. Thus, the long-term objectives and plans are divided into the micro programs, i.e., one specific cell of the ear-based cellular planning system.

This model rethinks an enduring, fragile idea of "integrated programs." That is, if the programs related to specific policies are designed as integrated packages, then this will make the systems of planning and implementation fragile and challenge since planners are somehow forced to terminate all running programs in case of any major environmental truculence. This brings a chaos and makes some of the implemented programs as useless; hence the resources are not utilized effectively. While such integrated planning is straightforward and cost effective, it shapes a challenging connection between the future and the past and the success of prospective plans will be made dependent to the running ones.

In short, we do not reject that the simplicity and affordability of the classic integrated planning, but we emphasize that this type of planning cannot assure an effective goal achievement of the system within diverse environments.

Comparing the classic integrated planning with the cellular model, we might say that there is a trade-off between economical simplicity and functional plasticity. In the integrated planning, coordination is mainly required at the domain of implementation. In contrast, the cellular model demands an extended coordination among different domains of design, selection, implementation, and evaluation. While this brings more complexity and increases the cost of policymaking, the cellular model enables the reassignment and reconstruction of the programs (cells) are yet implemented. In other words, in the traditional model of integrated planning, various components of the plan is based on the "strong ties" and hence any problem for one component (i.e., tie) will be extended to and affect the entire system. However, in the proposed cellular model, the relations among ties are made flexible and weak, and this generates a kind of functional plasticity for the system. One immediate outcome of these "weak ties" is an improved space for learning; novel pieces of information fluidly spread in the system.

Moreover, using this updated information and novel learnings, the emerging challenges and unseen needs are translated into a number of networks of cellular scenarios. This constitutes a comprehensive network by which one can define and communicate about the needs, in the current and future terms. During the development and operation of such cellular network scenarios, a cellular planning system takes its own shape. The full elaboration of how ECP model works in practice is beyond the scope of this entry. However, in the following paragraphs, we describe some of the key characteristics of this model.

In this cellular system, every cell of the plan implies a scenario (i.e., a plan at a specific period of one era). In the following figure, this comprehensive network is illustrated. Each letter stands for a specific era whereas each index represents a scenario. A set of (micro) programs which are strongly linked together constitutes a family plan. The first element of each index symbolizes such family plans. For instance, $E_{59}$ means the ninth program in the fifth "family plan" of the E era (Pourezzat et al. 2012b). As mentioned earlier, there is a considerable effort to design and maintain the ties between programs and plans flexible and weak. However, this does not suggest that all of these ties and connections are flexible. Sometimes, based on a perceived need for a local and temporal integrity, budget planners develop a selected number of strong ties to increase the process consistency. The notion of "family plan" as well as the idea of "mostly-weak-and-occasionally-strong" ties highlights this fact that a special consideration on the nature and function of ties is required in the application of the ECP model (Fig. 2).

As discussed earlier, the design of ECP allows sustained revision of the decisions and related policies. This generates accountability and care about the consequences of the decisions and pushes both the planners and executers to be sensitive about the quality and chain of what is being implemented.

This idea of the "chain of consequences" is better understood (and applied) in relation to the systematic connections among the cells. Each cell-based program alongside with other cells collectively shapes a plan. Cells can contain self-standing programs or they can hold one part of a distributed-linked plan. Moreover, some of the cell-based programs may be implemented at one era while there are programs which extend toward other eras. Thus, a plan (i.e., program package) may include the programs of one era or more. Based on this, we label two types of program package. First, the "horizontal packages" which capture those cell-based program packages that are totally implemented in a single era. Second, the "vertical packages" which stand for those program packages that go beyond the scope of one specific era, consecutively or intermittently (Pourezzat et al. 2012a; Pourezzat and Sadabadi 2013). The point is that the management of the horizontal packages seems to be easier and more straightforward. Although knowledge-based intelligence is an inseparable part of the ECP model, the organization of the vertical packages requires the higher level of intelligence and expertise. To remember our lessons from the field of futurology, since the implementation of these packages happens in longer terms, there would be an increased complexity and ambiguity (Pourezzat 2010; Pourezzat et al. 2010, 2011).

**Era-Based Budgeting System: Lessons from Budgetary Policy Failure in Iran, Fig. 2** Era-based cellular planning systems from age A to Z (Pourezzat 2010)

To conclude, in the ECP-based network of scenarios and plans, there are numerous cell-based programs which extend in the countless eras (as symbolically shown as A to Z). This design highlights the developmental progress of the planning system. In such progress, the system is incrementally and openly designed and this embeds constructed, reconstructed, and deconstructed processes through which the system is evolved. Hence, the form and quality of this system are reshaped by taking into consideration the emerging future.

## Era-Based Budgeting

In this section, we reapply the ECP model in the specific context of budgeting to generate a cellular-kind approach towards budgeting process as an alternative to the existing Iranian budgeting system.

A budget document is a quantitative expression of the plans. Or, it might be said that the purposes of the plans can be interpreted with budget figures. In short, we may call budgeting as the art and knowledge of allocating scarce resources to the unlimited needs. The process of budgeting involves different activities such as determining the objectives, arranging the operations, and forecasting the resources. To capture the essence of budgeting, we might say that it is a tool for economic development, economic and social justice and distribution (production of goods and welfare services) through a careful consideration of the needs of the society (Ebrahimi and Farajvand 2013, 184–185). To summarize its agential capacity, we can say that the budget document plays three roles:

- Managerial role: this is played out to provide public goods and services.
- Social role: this is played out to establish social justice and exclusion.
- Economic role: this is played out to assure economic growth and progress.

These roles are completely realized through the implementation of the budget policies set out by the state each year. The implementation of these annual policies should be in line with the macro and general policies developed for the country. That demands a close coordination and adjustment between the legislative and executive bodies of the state.

Considering budgeting as a financial planning system, in this entry, it is proposed that all of the ECP's characteristics are applicable in the context and process of budgeting and through such application, the final budget document is reconsidered

as an era-based plan in which one specific era is finalized and performed every year.

The flexible and plastic agency of ECP-empowered budgeting enables policymakers to rethink the designed policies in relation to recent events and completing knowledge. They can not only manage the undesirable consequences of the plans but also terminate one plan and replace that with a novel one. The cellular structure of the ECP-based budgeting generates conditions under which the future actions and policies become less related to the previous one, while in the traditional "integrated" planning approach on budgeting one failure in the past largely affects the chain of future actions. That is, it provides an opportunity to break path dependencies.

In an Era-based Cellular Planning Budgeting system (ECBP), the needs of people and society (or an organizational entity like a manufacturing company) are defined and programmed in the form of independent cells or scenarios. Then, an extensive matrix is created to represent the variety and diversity of the recognized needs for each era. For each period, a number of scenarios are selected to be implemented. Those scenarios which remain uncompleted will be extended to the next phase (era). Since each era has its own unique vocabularies and concerns, there should be a systematic, linguistic relationship among the needs recognized in the original era and the eras in which those needs are still being completed. This linguistic adjustment minimizes the "planning waste" and allows the seamless fulfillment of the ever-changing needs.

## Conclusion

The existing Iranian budgeting system is traditional, centralized, inefficient, nontransparent, cost-oriented, and heavily relies on oil revenues. In the 2016 budget bill, more than 60% of the total budget is allocated to the costs of governmental companies and agencies. Also, the average share of current expenditure in the total budget has been above 70% in the last few years. This means limited attention towards long-term, developmental plans. In this entry, we have shown the majority of these problems are associated with the old-fashion, static structure of existing Iranian budgeting system. The dysfunctional structure of budgeting system has resulted in the greater intervention of the government in the economy which itself has generated additional undesirable outcomes. For example, there is a lack of appropriate information about the results of final costs and allocated credits and the efficacy and effectiveness of the programs. That is, it is hard to evaluate and monitor how resources are used.

The practical and theoretical challenges associated with the existing model of budgeting alongside with the financial constraints and the increasing demand for improving public service provision altogether call for a new method for developing and implementing budget plans. In response to this perceived need, a dynamic method called era-based cellular planning (ECP) model is introduced and elaborated in this entry as a potential solution to some of the existing problems.

We argue that the application of the ECP model for the development of flexible budgeting system will generate new capabilities for the financing programs in the country to be more flexible and operational, especially in the face of unpredicted incidents. Moreover, this model increases optimum utilization of secret budgets, especially if watch-up subsystem is designed in a way that it can manage a group of confidential programs' cells in each era of operation.

One challenge remains as central in this proposed style of planning and that is how the budget is being controlled. It is clear that the greater complexity of the planning system will make controlling difficult since the "law of necessity of variety" (Ashby 1960) suggests that controller system must have sufficient diversity to be able in controlling the system which is meant to control. In addition to the diversity issue, "the law of complexity of the requirement" (Uhl-Bien et al. 2007) reminds us that the controller system must have sufficient complexity to control the system under its control. We proposed the watch-up subsystem as working solution to this functional challenge.

In short, we endorse that an increased complexity and diversity in the budgeting require more complex subsystems to control and monitor the implementing budget. The point is that under these circumstances a watch-up subsystem would be useful. Hence, to produce well-grounded

budgets, this watch-up subsystem should benefit from various relevant technical expertise. Having a package of expertise brings a capability in meeting the exceeding diversity of era-based budgeting system. The system should hold strong human (soft) and technical (hard) backdrop to monitor and control multiple scenarios and their changing relationship with the original scenario (i.e., in the previous period) and scenarios that result from each one (i.e., in the next eras). Thus, this proposed model should act and enforce other relevant variables to act in such a way that none of the cells in the budget (i.e., different scenarios of a plan) remains uncontrolled. Moreover, a strategy is needed to monitor and control the process of successful implementation of a plan.

It has also been said that the behavior of budget management system in era-based budgeting system resembles the Phoenix missile systems. To use this metaphorical analogy, budget executers watch up and track all the stages through which a target is reached as in the case of sophisticated radars; when necessary, they can cancel certain actions or cells and alternatively put in place new recalculated prioritization for the remaining path of the implementation process.

To conclude, this entry is an attempt to ever-changing economic, societal, and technological needs of the country. The constant evolution of the perceived needs requires dynamic systems within which budgeting activities are well developed and carried out. This entry proposes that cellular thinking is might be a useful approach in this regard.

# Ethical Competence

Donald C. Menzel
Northern Illinois University, DeKalb, IL, USA

## Synonyms

Ability; Expertise; Fitness; Moral sense; Proficiency; Sense of right and wrong; Skill; Suitability

## Definition

Ethical competence is the quest for knowledge and action that defines right and wrong behavior.

## Introduction

What does it mean to be ethically competent? Why is ethical competence so important? How is it achieved? The answers to these questions are in demand within and across academic disciplines and applied professions – medical, engineering, law, psychology, social work, public administration, and more. At its root, ethical competence resides in the human quest for knowledge and action that defines right and wrong behavior, the touchstone of ethics. Thus, an ethically competent person is one who through innate or learned behavior can distinguish between right and wrong and act accordingly.

One view is that humans have an innate ability to discern right from wrong and, therefore, can choose through free will to act (un)ethically. This view lends itself to an "either or" interpretation. That is, one is either ethical or not; there is no middle ground. While a careful reading of classical philosophers such as Aristotle (384–322 BCE) and Immanuel Kant (1724–1804) does not lend itself to this view, their philosophies are often interpreted as such. Both Kantian ethical principles and Aristotelian virtues have an "either/or" quality, one possesses them or does not. This arguable deterministic view is even more suspect in the age of life and work in complex modern organizations, the diminished grip of religious beliefs, lifestyles unbounded by family custom and social mores, and the explosive growth of professions in possession of expertise that can help or harm humankind or nature or both.

## What Is an Ethically Competent Person?

The ethically competent person must be capable of knowing the boundaries of his knowledge and expertise in order to do, as is often put in the medical profession, no harm. This fundamental necessity applies across occupations and professions, including public policy and administration. But is there not a significant difference between a doctor or a lawyer whose client is an individual/corporate entity and a public administrator whose client is a community or elected body? While it might seem straightforward to know how to do no harm to a patient facing surgery or an individual seeking justice, there is little straightforward about knowing how to do no harm to a community or a collection of elected bosses. But, none in the medical, legal, or public management professions live and ply their trade in such a simplified world. All are challenged to aspire to and practice ethical competence.

Ethical competence, particularly in the practice of public administration, is composed of discreet yet interrelated competencies – knowledge of ethics codes and laws, the ability to engage in ethical reasoning, identification of public ethics and values, commitment to high ethical standards, and advocacy of ethical practices and behaviors in organizations (Cooper and Menzel 2013). These competencies, as depicted in Fig. 1, stand in a dynamic relationship to one another.

*Ethical Reasoning*. Knowledge of ethics codes and laws is a necessary but not sufficient for achieving competence. The ethically competent individual must be able to reason through difficult perhaps complex ethical dilemmas that typically require more than invoking a principle (treat others with dignity) or possessing a virtue (always be honest). She must be able to assess the situation by gathering relevant information,

**Ethical Competence, Fig. 1** Dynamics of ethical competence. (Adapted from Menzel 2010)

realistically imagining choices and outcomes, and arriving at a decision that results in a resolution or dissolution of the dilemma. This reasoning process involves clarity of mind, creativity, and deliberation.

*Identify and Act on Public Ethics and Values*. Ethics and values defined solely in terms of the individual are important but so too are ethics and values ascribed to societal norms. Ethically competent public administrators must be able to accept and act on democratic and humanitarian values reflected in the community at large. For example, freedom of speech, assembly, and association are hallmark values in a democracy that public administrators must honor and respect.

*Promote Ethical Practices and Behaviors in Organizations*. This competency demands that public administrators do more than serve as ethical exemplars. They must be proactive advocates of ethical practices in their organizational environment. As leaders, public administrators must ensure that followers understand the importance of ethics in practice, not just in principle. In this sense, public managers and employees are guardians of public trust in democratic institutions.

*Commitment to High Ethical Standards*. This competency would seem self-evident but it is not always so, especially if one succumbs to moral muteness. The organizational imperative to get the job done can lead to a form of moral or ethical self-censorship. A commitment to high ethical standards is an antidote to moral muteness.

## Becoming Ethically Competent

But what are the pathways to ethical competence? The start point, as already suggested, is the individual whose ethical worldview is typically formed long before he begins the often arduous journey to becoming a professional. Parents, schools, churches, communities, and even friends leave ethical imprints. Finding one's ethical place within a profession, however, demands more. It requires knowledge of the ethical ways and mores of the profession secured from educational institutions, organizational employers, professional associations, and colleagues.

Ethical competence is a career-long endeavor often confronted by missed opportunities, blind alleys, and sometimes blind spots and other hazards. That being said, there are several pathways to becoming ethically competent: education, common sense, and experience.

*Education*. Competency-based learning is not a new enterprise, having deep roots in vocational education wherein skills are emphasized and tested. One can learn, for example, various

welding techniques with instruction and practice, but eventually one must demonstrate competence to a teacher or potential employer that she can apply effective and durable welds. Knowledge, of course, is a presumed quantity in this process, while ability is an essential ingredient. Nonetheless, out of this past arrived what is now widespread in many professional fields, not just vocational work – knowledge, skills, and abilities – commonly referred to as KSAs. The acquisition of KSAs in public administration is in vogue. The knowledge component relevant to ethical competence is the domain of formal educational programs at many universities and institutions. Training workshops and seminars offered by professional associations also enhance knowledge of codes, standards, and laws. The skills component for achieving ethical competence involves learning how to recognize an ethical issue and, if needed, take preventive action.

*Common Sense and Experience*. Educational institutions and professional associations are common paths to ethical competence, but they do not have a monopoly. There are other paths, including common sense and experience. Both are effective teachers that can impart knowledge and wisdom. Still, as the sage Confucius advises: "By three methods we may learn wisdom: First, by reflection, which is noblest; Second, by imitation, which is easiest; and third by experience, which is the bitterest." Experience, for all it offers, can be a risky and unforgiving teacher.

## Conclusion

There are many promising pathways to ethical competence. Nonetheless, even the most determined traveler may discover there is no single pathway that will get her to the desired destination. Why? Because there is no bright line that lets the traveler know when she has arrived. Rather, the pursuit of ethical competence is like running on a treadmill that does not have an off switch. One knows he is in motion but the destination is obscured by the absence of an off switch. This is not to suggest there is no destination but is to suggest that the destination can be a moving target always near but still just a reach away. All too often, however, one only knows when he has failed to achieve ethical competence by an unforgiving ethical moment when reality makes abundantly clear that ethical competence remains a cherished but elusive destination.

# Ethical Concerns and Migrants

Jean-Claude Garcia-Zamor and Kira Haensel
Florida International University, Miami, FL, USA

## Synonyms

Duty ethics; Migration; Refugees; Utilitarianism; Virtue ethics

## Introduction

This entry reviews how three prominent ethical theories can be used to guide the actions of policy makers who have to decide on the fate of those who are seeking asylum. The analysis is being done using the current situation of the migrants who are trying to find refuge in Europe. The massive number of migrants from countries at war who are arriving in European countries poses an unprecedented burdensome problem that is creating some ethical and moral dilemmas for European policy makers.

One of the main questions concerning the conflict in Syria is who or which countries are going to take the many people fleeing the war in and offer them a secure place to live. Opinions on whether the European Union and its Member States are obligated to take the refugees in are deeply divided. While German chancellor Angela Merkel thinks that "coping with war refugees is a European-wide obligation," Hungarian Prime Minister Viktor Orban who does not understand the resolution of the refugee crisis as one of his government's concerns disagrees (Deutsche Welle 2015). The ongoing dispute between the leaders of the EU countries shows that there are many ways to look at the migration problem and the question whether it is a country's obligation to take in refugees or whether it is ethical to refuse access to refugees. In the end, the question is one of moral nature, which doesn't make it easier to find an answer yet provides "lenses" to look at it and to discuss different standpoints and their application to immigration.

The three most prominent ethical theories chosen as such "lenses" are utilitarianism, duty ethics, and virtue ethics. Subsequently, a brief introduction to these theories and the main ideas behind them are given, followed by an analysis addressing the question: what insights the theories offer in terms of decision-making in the refugee question?

## Migration and Utilitarianism

Eighteenth- and nineteenth-century philosophers Jeremy Bentham and John Stuart Mill account for the founding fathers of utilitarianism. While the two defined utilitarianism in slightly different ways, they agreed that what produces the greatest amount of happiness is what should be done. But what exactly is happiness, and what is the relationship between happiness and morality? These questions are the main questions utilitarianism deals with.

The "principle of utility" as defined by Jeremy Bentham refers to "the principle that approves or disapproves of every action according to the tendency it appears to have to increase or lessen—i.e. to promote or oppose—the happiness of the person or group whose interest is in question" (Bentham 1948, p. 7). Thus, whether an act is considered "good" or "bad" depends on whether the consequence of this act increases or decreases the total amount of happiness for the persons affected by the act. Especially for the purpose of this reading's topic, it is important to note that "every action" refers to actions conducted by an individual, as well as to actions conducted by a government.

Happiness as defined by classical utilitarianism is "what makes a person's life better in itself for him" (Bykvist 2010, p. 17). Thus, happiness is a "subjective state," meaning that every person has her own set of values that increase or decrease her well-being. That said, it is impossible to generally say what happiness is and therewith what we specifically ought to do, but every person has to answer that question for herself, and answers may vary. On doing so, it is insignificant who this person is (e.g., origin, age, race, etc.); the only thing that counts is the person's well-being or happiness. Even though every person individually defines what happiness is for her, happiness is not an egocentric "thing," since "the individual's happiness will be found in doing what is morally right" (Crisp 1998, p. 5) and that is to maximize overall happiness (Crisp 1998). But essentially, utilitarianism, like other moral theories, is concerned with the question what makes an action right and what makes it wrong. In this context, it should also be noted that utilitarianism does not deal with the world as it is, but as it should be. This means that advocates of utilitarianism do not claim that people in fact choose to do

whatever produces the greatest amount of happiness but that this is what they ought to do (Crisp 1998).

Bentham's model applied to the case of the European refugee crisis would imply to sum up all pleasure and pain caused by an act as, for example, the acceptance or rejection of refugees by a country. In the course of this, it could be acceptable to compromise some pain if in the end the total value for pleasure outweighs the total value for pain (the greater the difference, the better). With reference to the question whether a country is ought to accept war refugees, one would have to consider the consequences of acceptance and rejection for everybody affected by that act, such as the refugees themselves, the population of the receiver, as well as the population of the sender country.

To provide some examples, consequences could be:

(a) If rejected, refugees remained in a life-threatening environment, a war zone, which could cause pain for them and their families, since the consequences of war are death, injuries, devastation, etc.
(b) If rejected, refugees could be protected from having to live in a discriminatory environment.
(c) If accepted, refugees could live in a safe place which could result in pleasure.
(d) The acceptance of refugees could challenge the economy of the receiving country and therewith lower the quality of life in the country.
(e) The rejection of war refugees could prevent economic migrants from entering a country, taking jobs away from the receiving country's population.

These and all other possible consequences would have to be summed up and ranked against each other measured by the value of pleasure and pain. The ethical thing to do according to utilitarianism now depends on the result of the calculation and which of the two acts (rejection versus acceptance) increases happiness for the groups of people in question.

What becomes clear is that one of the major issues with this practice, which by the way is not meant to be "strictly pursued before every moral judgment or every legislative or judicial operation, [but which] can be always kept in view" (Bentham 1948, p. 23), is the unpredictability of the consequences an act has; no one can tell what exactly the consequences of accepting or rejecting refugees are.

Another question that should be addressed when discussing migration policy making from a moral perspective is whether it is ethical to differentiate between refugees and people who migrate for economic reasons. According to the UN Convention on the Rights of Migrants, "The term 'migrant' in article 1.1 (a) should be understood as covering all cases where the decision to migrate is taken freely by the individual concerned, for reasons of 'personal convenience' and without intervention of an external compelling factor" (UNESCO 2016). A refugee in contrast is a person who did not freely choose to leave her country but was forced to flee due to war, violence, or similar reasons. Signatories to the Geneva Convention undertook to protect refugees, to allow such persons to enter their countries, and to grant temporary or permanent resident status to them.

According to utilitarianism, this differentiation between refugees and people who want to immigrate for economic reasons would be neither ethical nor unethical, since the theory doesn't differentiate between people based on features such as origin, race, age, gender, etc. The theory solely focuses on the amount of well-being produced, regardless of who the person is. "Everyone is to count for one, no one for more than one" – Bentham (Bykvist 2010, p. 18).

In terms of the European refugee crisis and the question if there is such thing as a moral obligation to accept war refugees, this means that according to utilitarianism there is none. Since the only thing that matters is the total sum of happiness caused by accepting refugees compared to the happiness caused by any alternative action and the motives and intentions remain irrelevant, one, thinking as a utilitarian, cannot speak of the existence of moral obligation to do something, but only of the obligation to do whatever increases the

total amount of the group whose interest is in question. This stands in total contrast to the theory of virtue ethics.

## Migration and Virtue Ethics

The youngest and at the same time oldest of the three normative ethical theories is virtue ethics. Based on the ancient Greek approach of virtue ethics, the theory was not recognized as such next to deontology and utilitarianism for the longest time. Within the last 40 years, however, virtue ethics has "acquired full status, recognized as a rival to deontological and utilitarian approaches, as interestingly and challenging different from either as they are from each other" (Hursthouse 1999). Plato and Aristotle were the first to discuss motives and moral character in human behavior which the theory of virtue ethics is based on. Whereas utilitarianism concentrates on the outcome and the consequences of actions and deontology on duties and rules, virtue ethics emphasize (as the name already discloses) virtues, motives, and moral character. Accordingly, "the role of emotions in our moral life" (Hursthouse, On Virtue Ethics 1999), meaning thoughts regarding what kind of person one should be and how one should live, was taken into account for the first time.

The main thought behind virtue ethics is that "an action is right for an agent if and only if the agent would do it from a virtuous motive (or the most virtuous motive available to the agent)" (Bykvist 2010, p. 29). It becomes clear that in contrast to duty ethics, virtue ethics focus on what we ought to be rather than what we ought to do.

Thus, there are no duties, obligations, and laws that tell one what is moral to do in virtue ethics, but moral obligation is understood as an "empty concept" that has no validity (at least in the most extreme version of virtue ethics). While the other two ethical theories addressed here refer to "what we legally ought to do or what would best contribute to our welfare" (Statman 1997, p. 4), virtue ethics refer to what we ought to be, and that is a virtuous person. Yet, it is not a certain kind of behavior that needs to be good or right in order to confirm virtue, but a character trait of the actor. This means that an actor executes an act not because the act itself is good or contributes to people's welfare, but because of her (virtuous) character. More moderate versions of virtue ethics however do accept the idea of obligation and rightness of action as long as it is clear that these two derive from aretaic ethics, meaning the virtues of character (Statman 1997).

Thus the question, what is a virtuous person or what makes a person a virtuous one? Naturally, a virtuous person is one who has internalized all the virtues. Virtues in this context are "some kind of relatively fixed character trait, involving dispositions to think, feel, and act in certain ways" (Bykvist 2010, p. 28). This means that a person with perfect moral virtues is one "with morally right desires but with no commitment to seeing to it that they remain right and (typically) with no conception of them as right" (Baron 1985).

Consequently, an act becomes virtuous if it makes a human life flourish, meaning that through the act, the actor's life becomes a better human life. Extreme version of virtue ethics argues that moral virtue is closely connected to intellectual virtue, which implies that in order to be a character of moral virtue, one has to have character of intellectual virtue. This in turn means that virtuous character, intellectually as well as morally, shall remain reserved to the elite (Rorty 1996).

The role of culture in the development of virtues has been addressed by intellectuals, such as British philosopher John Cottingham, who described "good life" as a "structured pattern of living. . .whose fundamentals have to be rooted in a civic culture, a culture in which the right pathways of emotion and action have been laid down in infancy and fostered by long habits of training and upbringing" (Cottingham 1994, p. 177). Cottingham adds that it is yet not impossible for a person who grew up in a culture that did not lay down the "right pathways of emotion and action" to become a virtuous person. However, this would require a "radical self-remarking will" (ibid.) that only small elite would have. This relates to Rorty's argument mentioned earlier, in which she explains the connection between intellectual and moral virtue (cf. p. 12).

In reference to the European refugee crisis and the question whether there exists a moral obligation for a country to accept refugees, advocates of the most extreme version of virtue ethics would negate this question, since moral obligation is understood as an "empty concept" that has no foundation because principles such as moral obligations have failed as a guide for the solution of practical dilemmas. Thus, practical dilemmas are too complex as that they could be solved through the application of a principle that in most cases cannot offer a solution to conflicting considerations which are inherent in practical dilemmas. More moderate versions of virtue ethics however would argue that there could be a moral obligation, as long as it derived from a virtuous character or mind.

It becomes clear that the definition of "virtue" is not universal but rather subjective. This opens to the door more than one possible "right" act in one situation. In other words, one practical dilemma can have more than one "right" way to act upon, depending on the virtues at stake. Applied to the present case of the European refugee crisis, two virtuous persons could be asked the same question, for example, whether they would vote in favor or against a refugee quota that determines how many refugees each member country of the European Union has to receive. Important in this connection is that both persons are facing the same situation under the same circumstances. Virtuous person one could say that out of solidarity to the refugees she thinks that a refugee quota is a good idea, since it would provide people with a place to go (which they otherwise might not be offered). Virtuous person two however could say that she thinks out of respect for the refugees' freedom to choose for themselves which country they want to live in that the refugee quota is not a good idea. This means that "two virtuous agents, faced with the same choice in the same circumstances, may act differently', and, nevertheless, both be right" (Hursthouse, Slote on Self-Sufficiency 1993).

What has to be mentioned however is that in order for the explained example to be valid, one must accept that "right" and "wrong" are not necessarily contraries and that an act can possibly be right and wrong at the same time. This means that one can act in favor of one virtue and at the same time, through the same act, contrary to another. Virtues would be conflicting in this situation due to the fact that there is more than one "right" solution (Statman 1997). Another potential for conflict is the definition of virtues. Definitions could vary from person to person and culture to culture and as a consequence reduces the generalizability or universality of the theory.

In terms of the European refugee crisis, "culture" is an especially sensitive matter. One fear is that the cultural differences between refugees and the population in receiving countries will be insurmountable. Differences in culture and their connected virtues have been portrayed as especially strong between the occident and the orient by critical voices. Others however praise multiculturalism and interpret the crisis as an opportunity to develop a more open-minded, tolerant, and diverse culture in Europe. The question for virtue ethics in this context would be what should and what should not be considered a "virtue," who decides on that, how much leeway should be given to definitions, and where is the fine line between virtue and the contrary?

In contrast to utilitarianism, according to virtue ethics, it would be ethical to act in a certain way, even if this way was not the most beneficial in terms of overall happiness. A justification for such an act could, for example, be the fact that someone wishes or decides to be a certain type of person. Applied to the European refugee crisis and the question whether countries are ought to accept or reject refugees, this would mean that according to virtue ethics, it could be ethically acceptable to receive refugees even if it was confirmed that the negative consequences outweigh the positive ones, just because it is a virtue to the actor to be charitable, kind, and willing to be helpful (Swanton 1997).

In terms of the earlier question regarding if there was a moral obligation according to moderate virtue ethics for a country to accept refugees, it can be said that there could be one, as long as this obligation derives from a virtuous character or mind. Considering the situation of refugees fleeing a war that put their lives in danger and maybe

destroyed their goods and chattels, in other words considering there is a person in need, one could argue that a virtuous person whose character traits include, for example, kindness, would want to help the person in need. Yet not because someone else made it obligatory to her, but because she herself recognizes that she is obliged to help, because it is a virtuous thing and she is a virtuous person with respective character traits.

## Migration and Deontology/Duty Ethics

Eighteenth-century philosopher Immanuel Kant accounts for the founding father of duty ethics and the concept of the categorical imperative. As the name "duty ethics" already implies, according to this theory, an action is moral if it is done from duty. In this context, something is done from duty if it is done because it is the right thing to do (Stratton-Lake 2000). In order to understand the thought behind Kant's concept of duty, a closer look at what is understood by "duty" is necessary.

The word "duty" for some people might have a negative connotation; soldiers supposedly kill out of duty (to their country or to their fellows), and judicial officers out of duty (to the law) could make a family homeless, because the family was unable to pay the rent even though the reason for their illiquidity could be that the father fell ill with cancer. In other words, doing something "out of duty" in common usage is not necessarily something that is understood as morally "right," but rather morally questionable. The way the word "duty" is used in duty ethics is different from what was described before. Thus, for Kant, "duty" refers "solely to the respect we owe to humanity in ourselves and others and to the various forms of moral self-constraint that we must exercise, when necessary, in order to be rationally self-governing beings" (Wood 2008, p. 159). Accordingly, Kant differentiates between "juridical duties," meaning a duty that is externally coerced, and "inner or self-constraint duties."

"Inner or self-constraint duties" are duties that one herself decides to act upon from free will and not because an external party tells her to do so. In other words, "'Duty' refers to the act of freely making yourself desire something and do it because you appreciate the objective moral reasons there are for doing it" (Wood 2008, p. 159). What needs to be clarified now is what would account for "moral reasons" as motive of duty. Put differently, what makes us desire a certain action? Kant, besides from objective reasons, also mentions feelings (*The Metaphysics of Morals*). He divides them up into four categories, which are (1) moral feelings ("feelings of approval or disapproval directed at actions"), (2) conscience ("moral feelings directed to oneself, in view of some action performed or contemplated"), (3) love of human beings ("e.g. any form of benevolent caring or concern for the welfare of another as a person who is an end in itself"), and (4) respect ("for the dignity of a person, or for the moral law as the basis of our own rational self-government") (Wood 2008, p. 160).

Kant furthermore defined the "moral principle" or the "supreme principle of morality" through what he calls "the concept of a categorical imperative." The "moral principle" strictly speaking consists of three "formulas": (1) the formula of universal law ("Act only in accordance with that maxim through which you can at the same time will that it become a universal law"), (2) the formula of humanity as an end in itself ("So act that you use humanity, as much in your own person as in the person of every other, always at the same time as an end and never merely as a mean"), and (3) the formula of autonomy ("the idea of the will of every rational being as a will giving universal law") (Wood 2008, p. 66). These "formulas" in turn are based on the concept of the "categorical imperative." This concept presumes that every action consists of an end and the required means to the end. Thus, one sets and ends (something one wants to do or achieve) and performs the required means (whatever it takes to achieve the end). This is what Kant calls a "hypothetical imperative." A "categorical imperative" in contrast is "not conditional on some prior end", which means it is valid in any case, without exceptions. It furthermore demands one to do act in a certain way, regardless of what one might "want" to do (Wood 2008).

In terms of the European refugee crisis and the question whether countries should accept refugees, this would mean that according to Kant, one would have to ask himself if one could consistently and rationally want that everyone thinks it's ok to refuse access to refugees. Keeping the first and the second "formulas" of the moral principle, which refer to "the will that one's act becomes universal law" and "humanity as an and in itself" in mind, one would come to the conclusion that refusing to admit refugees and therewith refusing help to people in need would disrespect formula one and two and can thus not be a morally right act in accordance with duty ethics.

Kant further differentiates between "rights" and "ethics," which both entail their own "systems" of duties. "Right is a system of rational moral norms whose function is to guarantee the treatment of humanity as an end in itself by protecting the external freedom of persons according to universal laws" (Wood 2008, p. 162). Right underlies juridical duties that are enforced or coerced by external powers such as civil or criminal courts. Yet, Kant emphasizes that (unfortunately) not all juridical duties can be coerced (e.g., in international rights). Ethical duties in contrast "must never be coercively enforced" (Wood 2008, p. 162). "Ethics" refer to what was mentioned earlier concerning "inner or self-constraint duties."

Applied to the case of the European refugee crisis this would mean that a country that would act in a morally correct way, according to duty ethics, would be a country that out of duty, for instance, motivated by the concern for the welfare and well-being of the people fleeing a war (love of human beings), decides to admit refugees. A country could also act morally by taking refugees in with the motive to comply with the Geneva Convention from 1951, whose signatories agreed to protect refugees, which includes allowing them to enter their countries and granting them some form of legal status (e.g., permanent or temporary residency).

One of the debatable aspects of Kant's theory of duty ethics is whether two duties can be conflicting. Conflicting conflicts could lead to a moral dilemma, meaning that whichever decision the agent makes, the act cannot be solely "right." An example would be a promise that one cannot keep or, with reference to the European refugee crisis, the question whether helping the refugees (duty one) and protecting the country's society (duty 2) are conflicting. Kant states that two duties cannot conflict in way that would make it impossible to do "right." More specifically, his argument consists in the following:

A conflict of duties would be a relation between them in which one of them would cancel the other (wholly or in part). – But since duty and obligation are concepts that express objective practical necessity of certain actions and two rules opposed to each other cannot be necessary at the same time, if it is a duty to act in accordance with the opposite rule is not a duty but even contrary to duty; so a collision of duties and obligations is inconceivable. However, a subject may have, in a rule he prescribes to himself, two obligating grounds, one or the other of which is not sufficient to put him under duty. When two such grounds conflict with each other, practical philosophy says not that the stronger obligation takes precedence but that the stronger obligating ground prevails (Kant 1996, p. 16).

The abovementioned example would account for what Kant calls "two obligating grounds." Thus, there would be two different obligating reasons: one would be to help people in need (the refugees) and the other would be to protect the country's society. The first point offers a reason why there is a strict duty for a country to accept refugees, while the second one provides a reason why there is a duty not to do so. According to Kant, the "stronger obligating ground prevails," meaning the stronger reason (in our example either to protect the country's society or to help the refugees) "wins." But how does one decide which reason is stronger? While he defines different categories of duties, such as imperfect and perfect duties for which a guideline addressing which duty is "stronger" is given, Kant does not specifically offer an answer to this question that would satisfy each and every case (Wood 2008).

Another issue with Kant's theory is similar to the difficulties with the subjective definition of

virtues in virtue ethics. Thus, the definition of absolute morals is not generalizable; different people living in different cultures could use different definitions.

## Summing Up

It is quite complicated for EU policy makers to address the issue of the refugees with an ethical and moral approach. This entry illustrates how complicated an ethical and moral policy would be for any individual country. The process becomes even more complex when any national policy might require a consensus between the 28 autonomous governments of the European Union. The entry also discusses how ethical policies might affect both the negative and the positive consequences of migration. It emphasizes how difficult it is to adopt ethical policy initiatives that could solve or at least control the present chaos, disorder, and uncertainty created by the arrival of this massive number of refugees. Many of the policies being contemplated might create an unsustainable economic and political challenge to the European countries.

## Synonyms

Ethical behavior; Ethical conduct; Ethical reforms; Role model behavior

## Definition

Ethical culture in Tanzania is regulated by code of ethics and conduct of public servants of 2005 and code of ethics for public leadership Act of 1995.

## Introduction

As a response to the crises of public services delivery in Tanzania which surfaced in the 1980s, the Tanzania government took some measures to reforms its public service from the early 1990s. The goal of the reform was to increase

efficiency and effectiveness in the delivery of public services. As an endeavor to make the reforms successful, in 1995, the government enacted public leadership code of ethics act, and in 2005, the government endorsed another code of ethics and conduct for public service. The general assumption was that creating legal framework would be an important instrument to instill ethical culture in the public service which is an important means to aid the success of the reforms. Nevertheless, despite the introduction of the legal framework, the important virtues for building ethical culture were not clearly linked with the reforms. In nut shell, this entry portrays the practice of these virtues in Tanzanian public service.

Meanwhile, in order to be more enlightening, the discussion in this entry is informed by ethical virtues model developed by Kaptein (2008). The virtues were first developed by Kaptein (1998) and validated in 2008. These virtues represent organizational conditions for ethical conducts based on normative criteria. The first is clarity which represents the extent to which organizational expectation of employee moral conduct are accurate, concrete and complete. The second is role model behavior which implies the extent to which the relationship between the supervisors and subordinate reflect ethical expectations. Third is consistency/congruence which means the extent to which the behavior of the employees is consistent or inconsistent to that of the organization. Fourth is feasibility and achievability which imply the extent to which employees have sufficient time, equipments, budget, information, or authority to fulfill their responsibility. Fifth is supportability which implies the extent to which employees are motivated with work and the trust to organization. Sixth is transparency which measures the extent to which ethical issues are observable and the possibility of getting caught in case of violation. Seventh is discussability which measures the extent to which it is permissible to discuss and share issues of unethical behavior in organization and the eighth is sanctionability which measures the extent to which unethical behavior is sanctioned in organization.

In turn, to understand the status of ethical culture in Tanzania public service, these virtues are framed into one research question which forms the structure of this entry. The question is *how has ethical culture in Tanzania public service evolved overtime? And how do the existing ethical legal framework and the actual practice reflect the organizational ethical virtues model?*

In the first section of the entry, the antecedents of ethical culture and the legal framework (leadership code of ethics and code of ethics for public service in Tanzania are discussed). Section two is dedicated to the concept of ethical culture and general literature about its measurement and organizational ethical virtues model. Section three focuses on the experiences of ethical culture in Tanzanian public service based on the opinions and views of the public servants involved in the delivery of public service at the central government level (the Ministry of Agriculture and Home Affairs), local government authorities, and other government institutions.

## Antecedents of Ethical Culture and its Legal Framework in Tanzania

The trend for the development of ethical culture in Tanzania like other African countries is associated with colonial legacy which led to the development of extractive institutions. The development of extractive institutions accelerated the concentration of power and opportunities in the hands of few colonial administrators. The concentration of power in the hands of few people led to the divided public service which forms two publics: the primordial public which believed on the private interest as a prime motive for work and the civic public which believe on the public interest as a prime motive for work (Ekeh 1975, Ekeh 1998; Acemoglu 2012).

Given this trend, after independence, the public servants in Tanzania adopted the idea of the primordial public in which they believe on private interest as opposed to public interest. As a result, the public servants equated their positions in the public service with wealth (Tenga 2010). Apart

from that, the laws inherited from the colonial government to deal with the issues of unethical behavior were inadequate. Following that, the government established a new institution titled the Permanent Commission for Enquiry to replace the colonial law of prevention of corruption which was established by colonial administration – Ordinance Cap 400 of 1958.

Contrary to the expectation, the commission was not able to eliminate the problem of corruption. Consequently, in 1967, the government inaugurated Arusha declaration as a breakthrough to fight corruption and revive the ethics of public leadership. The declaration specifically developed the code of ethics for ruling party leaders which was by then Tanganyika African National Union (TANU) (Tenga 2010).

Nevertheless, there was no one code of ethics to regulate the behavior of public servants. The existing code of ethics was still fragmented into different laws and regulations. This fragmentation makes it difficult for public servants to understand what is expected of them in terms of ethics. To address this problem, in 1995, the government enacted one code of ethics for public leadership. The code defines what is expected of public leaders in terms of ethical conduct. In nutshell, it instructs the public leaders to declare their properties and to avoid conflict of interest by avoiding personal interest to conflicts with their leadership responsibility (URT 1995).

Apart from the leadership code of ethics, the code of ethics for the public servants was established in 2005 to regulate the behavior of other public servants. This defines all types of unethical acts and conduct which are not allowed in the public service. These ethical conducts includes among other things, respecting all human rights. This means avoiding discriminating others on the ground of sex, tribe, nationality, ethnicity, or marital status and avoiding sexual harassment at work place. Second, it instructs public servant to perform their duties diligently and in a discipline manner through obedience to law. Third, it instructs public servants to perform their duties efficiently and to observe punctuality. This includes observing dressing code, team work, and pursuing excellence in service. Fourth, it instructs public servants to exercise their responsibility and good stewardship through acting within their boundaries of a given authority. Finally, it instructs public servants to observe transparency and accountability and the principle of meritocracy and integrity in discharging their functions (URT 2005).

Nevertheless, despite this new development, unethical conduct is still omnipresent in the public service. The legal mechanisms to regulate unethical behavior have been established, but they are not enforced properly by the existing authorities. One of the reasons is that public servants are assigned the tasks which do not match the resources given and the capacity to carry them out. This problem is compounded by little pay which they receive as salaries/wages. As a consequence, for example, gift and bribes are widespread when apply for public utilities and licenses while for procurement public officials often favor well-connected companies and individuals when awarding contracts (URT 2016).

## The Concept of Ethical Culture and Its Measurement

Over the years, the concept of ethical culture has experienced a drift which is attributed by varied definition from different authors. Some authors like Grint (2007) consider it as moral virtues that could be instilled in individuals through practices and learning while others such as Fox and Meyer (1995) see it as rules and principles that determine the right and wrong and others like Van der Wal et al. (2006) see it as adherence, or non adherence, to moral values and norms. This entry follows the definition by Treviño and Weaver, (2003) who perceive it as the representation of a subset of the overall organizational culture combining informal and formal system that work together to guide employees thought and actions. Formal cultural system includes organizational policies, leadership, and rewards system and informally it includes coworker attitudes, behavior, and ethical norms. These together establish what is considered as an ethical culture which guide employee's

behavior toward ethical behavior in organization. Thus, ethical culture includes those aspects of the perceived organizational contexts that impede unethical behavior or the aspects in organization which stimulate ethical conduct.

Therefore, realization of organizational goal depends on the existing ethical culture in organization because the ethical culture influences the behavior of official's directly through formal and informal control system and finally produces the workforce which is highly committed to organizational values and willing to contribute to the realization of organization goals (Trevino et al. 1998; Trevino and Young blood 1990).

## Measuring Ethical Culture

The numbers of dimensions for measuring ethical culture have been developed. The legendary framework for measuring ethical culture was first developed by Kaptain in 1998 who developed the number of ethical culture dimensions and validated them in 2008. These dimensions were further developed into ethical virtues model which represent the organizational conditions for ethical culture. These conditions includes clarity which means the degree to which organization expectation of employee moral conduct are accurate, concrete, and complete; second is role model behavior which measures the ethical relationship between supervisors and their subordinates; third is consistency which measures the consistency between the behavior of employees and that of the organization; fourth is feasibility which measures the amount of time, equipments, budget, information or authority given to employees to fulfill their responsibility; fifth is supportability which measures the motivation and commitment to ethical policies of the organization; sixth is transparency which measures the observation of ethical values; seventh is discussability which measures the extent of sharing of information about ethical behavior; and finally is sanction ability which measures the extent to which unethical behavior is sanctioned within an organization.

## The Practice of Ethical Culture in Tanzania

This section is dedicated to the practice of ethical culture in Tanzania. The section begins with review of government reports concerning unethical conduct of government officials. The review focused on the list of government reports which includes: Tanzania corruption reports of 2016, Controller and Auditor General reports of the past 3 years 2014 /2016, and Public Finance International report of 2017. Together, these reports suggest that unethical behavior is still rampant in the public service in Tanzania. For example, Tanzanian corruption report of 2016 suggest that gift and bribes are widespread when apply for public utilities and licenses. Regarding procurement, public officials often favor well-connected companies and individuals when awarding contracts. The state of corruption is also proved by the Public Finance Internal report which shows that the current audit report of civil servants indicated that 1538 academic records of civil servants were being used by more than one official and 11,596 staff had incomplete records.

Apart from that, the Controller and Auditor General reports indicated that municipal directors, councilors and tender boards formed by civil servants violate financial regulations in decision-making for personal interest. This includes fraudulent payments of subsistence and extra duty allowance, settlement of creditors who were not identified, missing payment vouchers, and transfer of funds without approval of the finance committee (URT 2014) The review also include the *Tanzania Ethics secretariat communication strategy of 2015–2017* which indicate that the secretariat is weak and does not perform its functions effectively because it does not adequately involve all stakeholders and does not have sufficient resources such as zonal staff and finances to carry out its functions. But also it lacks power to sanction those who do not abide by code. To get in-depth information concerning the widespread of unethical behavior, the in-depth interview with 30 officials from different levels of central government and local government was conducted based on the framework of measuring ethical culture.

## The Clarity of the Code of Ethics in Tanzania

With respect to clarity issue, the research shows that public servants are required to abide to code of ethics when making decision. The public servants believe that the code guide them to make ethical decision. In addition, the interviews shows that the human resources officers from the ministry and local government organize frequent meetings to discuss and remind the civil servants in different sectors about the importance of the code. An example is the recent meeting of human resources officers and the health staff of Temeke municipality. The meeting had an objective of reminding the staff about the importance of the code of ethics and what is expected of them in terms of ethical behavior. Nevertheless, the violations of the code still exist, and some complaints have been reported by citizens. Second, concerning *the supervisor* vs *subordinates* ethical relationship, the research shows that it is mandatory for public servants to learn and follow the guidance from their supervisors. The instruction and learning is through meetings and specific instruction gives to subordinates by supervisors. Nevertheless, the instruction is not often successful. The Ministry of Agriculture serve as an example where senior officials have been accused for having a sexual relationship with their subordinates and hence destructing their working relationship. Third, concerning consistency, the interviews shows that officials goals are highly compatible with organization goal. In every day work, they strive to achieve their departmental goal and their supervisors make sure that they work towards organization goals. Nevertheless, in some cases, the employees were found to engage in the behavior which is not consistent with that of organization. Fourth, concerning supportability, the research found that in some cases, the organization such as a ministry assigns some task to employees without providing the necessary resources. An example is the Ministry of Agriculture where employees were assigned to audit the staff certificates, and in some cases, they were supposed to travel to some centers where the exercise was carried out but their allowances were not paid on time. Alternatively, the staff had to use their own means to travel to those areas. Another example is in local government authorities where staff were assigned to organize and conduct meetings concerning the awareness of the code of ethics but the cost for the meetings and their allowances were not paid on time.

Fifth, concerning feasibility, the interviews show that in these organizations the bosses are given authority to exercise their responsibilities and they use their authority well but to the larger extent they do not have sufficient equipments and budgets to carry out their daily duties. The budget allocated by government to carry out these functions is limited. Temeke Municipality serves as an example where civil servants particularly the field workers in agriculture sector and health professionals are given the task to fulfill without enough budget and working equipments. Fifth is supportability in which the research shows that public officials are not motivated with their work The low motivation is all government levels is caused by low payment and the reduction of different types of allowances which were paid before the current phase of government. This also includes the delay of allowances. Sixth is transparency in which the research shows that transparency is still a problem, some of important decision like decision concerning employees training program are not transparent and the decision concerning short course training does not follow the procedures. Concerning discussability, some employees for example in the public service commission show that they could not discuss some complaints with their bosses because of fear to lose their job and alternatively they discuss them during public meetings with the director. Concerning sanctioning of unethical behavior, the research shows that the officials, for example, in Temeke Municipality have the authority and special program to remind the public servants to refrain from unethical behavior. This includes instructing them to make follow-up of complaints from citizens and punishing all unethical behavior in organization. Another example is the ministry of agriculture in which some officials of the department of

procurement were suspected to demonstrating unethical behavior and in response to that these officials were called upon and warned by human resources officer.

## Conclusion

The trend of ethical culture in Tanzania has been transformed in different phases. This transformation varies from the time of independence until recently. Through out the history, the government has taken different measures to invoke ethical culture in the public service. Some of these measures which have been quite successful are the establishment of the code of ethics and ethics secretariat to ensure its implementation. Nevertheless, some important elements for establishing ethical culture have received little attention in the reforms process. For example, the issue of discussability and transparency concerning the code of ethics at work place is still a challenge. The employees especially of the lower cadres are not free enough to discuss the issues related to ethics especially if the issue concerns their supervisors. Another is the issue of supportability. The organization support to employees is still insufficient. The employees in the public service are assigned task without enough resources to fulfill these tasks. This kind of situation motivates the civil servants to engage on unethical behavior. Finally, the supervisor as a role model has not received due consideration. As the research shows, some supervisors demonstrate unethical behavior because their role of communicating ethical expectation has not been emphasized in their organization.

Therefore, for ethical reforms to be successful, these flaws must be addressed. The establishment of the formal code of ethics and ethics secretariat should not be seen as end in itself but as a means to end. The government should strengthen informal system through rewarding ethical behavior, providing ethical training and modeling ethical behavior. Finally, for the ethical reforms to be effective, the government must be explicit about the strategy for increasing transparency and discussion of the code at workplace and must make sure that the civil servants are assigned the task which corresponds with the available resources.

## Introduction

Dependent upon public authority, innumerable citizens can be positively affected or dramatically harmed, taxpayer dollars can be efficiently managed or incalculable in loss, and public agencies can be perceived as problem solvers or simply agents of ineffectiveness and obsolescence by the public they serve. Employing a process to affect lasting positive outcomes in the public interest through ethical decision-making is rife with hurdles and one might therefore assert is not, nor should it normally be, easy (Sessions 1950).

Few situations could be more instructive in dissecting *what went wrong* in ethical decision-making than exposés beginning in 2016 that tracked the tragic lead poisoning of the municipal water system of the City of Flint, Michigan. Public management decisions at state, local, and federal levels directly affecting the economically ravaged city *caused* irreparable harm to Flint's children and citizens (Events 2016; Gupta et al. 2016).

Whether represented by an initial cost-cutting decision to switch water supplied from Lake Huron to that coming from the Flint River without treating river water to protect against lead pipe corrosion in Flint at a reportedly available $150/day cost, or what The Detroit News editorialized as the "negligent and mind-bogglingly bureaucratic response to resident complaints about the water," or the time taken to ultimately hold accountable those public servants who were aware and yet failed in their fundamental ethical duties and oversight to citizens, the resulting debacle has manifested tragic and long-term unethical consequences (Assigning Blame 2016; Poisoned Water 2017). The Flint, Michigan lead water scandal presents a historical case study in the failure of ethical decision-making at multiple public levels, with but a few courageous public servants willing to ethically voice what should have been a superseding public interest in decision-making (Gupta et al. 2016; Taillefer 2016).

The mistakes impacting Flint remind that considerations and decisions of public administrators *should* remain under continuing objective and transparent public scrutiny. And yet at the same time, the process of decision-making for public administrators has never been as severely challenged by stakeholders who retain polarized partisan, personal, and/or business, labor, and community conflicts of interest throughout stages of issue identification and consideration for public authorities, perhaps through endless appeal.

How then is one to proceed through the minefield of challenging ethical decisions in an applied fashion?

The author's purpose in this Chapter is to provide a general, yet dynamically capable, applied structure for deciding long-term ethical choices across varied public administrators in their duty to the public.

Proposing an applied framework, the author cautions that the field of ethical decision-making is diverse and steeped in the academic literature, including that presented in this Encyclopedia. The analysis and research of others, some of which is cited here, is not intended to be supplanted and if unfamiliar to the reader is worthwhile for further

exploration and critical examination as a public administrator and decision maker (Bazerman 1994; Craft 2013; Gentile 2017a; Newell et al. 2014; Paine 2006; O'Fallon and Butterfield 2005; Sandel 2017; Shapiro and Stefhovich 2001).

Guiding those who find themselves required to make ethical choices for the public across varied administrative authority, this work is designed to provide a cognitive outline founded upon six practical, decision-making steps (Fig. 1). This decisional framework embeds core ethical values with probing questions to remind decision makers not only of a full consideration of external circumstances but also foster awareness of social and psychological hurdles that can derail ethical intent and outcomes in long-term public administration decision-making.

Suggesting an applied process of cognitive decision-making to augment value-laden approaches to instilling or encouraging ethical action, the author is constantly reminded of the insight of ethicist Michael Josephson, "We judge ourselves by our intent, but we are judged by our last worst act." (Josephson 2017)

## Stakeholders

While perhaps a bit more familiar in sectors other than public administration, the concept of **stakeholders** and considering the input and potential consequences of decisions as they impact stakeholders *prior to action* is key to this recommended framework of ethical decision-making.

Simply put, "**stakeholders**" are those actors who can affect, or are affected by, a decision (Freeman 1984; Univ Kansas 2017). Various categories of stakeholders are described in the literature and may be categorically itemized as required sources of input to individual decision-making roles because of their roles (Bader et al. 2011; UK NHS 2017; Univ Kansas 2017; World Bank 2017).

Employing the saga of Flint, Michigan and the lasting impact of its lead water poisoning as a poignant example, stakeholders can be varied, numerous, and shift required priority of their consideration depending upon the issue to be decided. In that debacle for example, citizens directly affected by contaminated water should have been prioritized above other stakeholders as decisions were made; particularly children and the elderly who were impacted more severely by the negative, long-term health consequences of lead contamination (ATSDR 2007).

Stakeholders in public administration decisions in addition to the public at large are at times particularly thorny to identify (Bader et al. 2011). While traditional political parties continue to influence pubic decision-making and leaders, their impact has become diluted by organized and informal groups of partisan, issue-specific, personal, union-based, and business-driven individuals and organizations (Hayes 2016). Globalization and increased electronic transparency have also amplified stakeholder awareness and increased stakeholder contribution to decisional processes (Friedman 2005).

## "Instinct," "Sensibility," and Our So-Called "Gut"

Before walking through a general applied framework for ethical decision-making, it is incumbent to mention the role emotions (and later, irrationality) have upon making the correct moral choice (Haidt 2001). If fact, some fundamental moral choice proponents have suggested that linear and cognitive strategies may obstruct ethical decision-making, deterring what the decision maker inherently knows to be the ethical choice or fostering rationalizations for acting (Hauser 2007; Lerner et al. 2015; Zhong 2017).

Yet relying on emotions, instinct or "gut" alone has been challenged by both analysts and academics for ongoing decisional failures (Hertz 2013; Paine 2007).

## Six-Step Applied Structure of Ethical Decision-Making

The author recommends a six-step, applied process of Ethical Decision-Making for public

1. ***Facts****;* Critically "discern" facts:
    - **First, "Stop and Think"**… before acting
    - A**ctively listen**; **aggressively push to realize *all* pertinent facts**
        - Bad "Facts" do not age well with time.
    - Stakeholders may hold **conflicting interests** or appeal to our **biases**
        - **Express expectation to** *stakeholders to fully disclose facts*
    - **Prepare analytical, objective and probing Q's** to challenge bias
2. ***Issues****;*
    - Identify Stakeholders - Those affecting, or are affected by, a decision
    - What are the Ethical Issues? - ***3 questions*** *assist identification*:
        a. Who is making the decision?
        b. Whatis or should be our role in the decision making process?
        c. Who is likely affected by the decision? In what manner?
3. ***Ethical Standards****;* L*ook long-term* with **5 fundamental challenges**:
    - What is our **Duty**? – Overriding duty "best interests of the public"
        - Laws, codes of conduct & organizational values applicable?
    - What are the **Rights of Stakeholders** we need to acknowledge & observe?
    - What is **Best Practice** in our authority or public charge?
    - What are our **Core Values** and **do they align** with our Organization?
    - How **are competitive** duties, rights, best practice and values weighed?
4. ***Input****;* Seek information from a diversity of stakeholders
    - Is there need for others' experience, independence, or expertise?
5. ***Impartiality*** *and* ***Transparency****,* and;
    - We are **all** self-interested Which perspective, including ours, is objectively most supported by the Facts, and which less?
    - Were diverse stakeholder input and creative, yet ethical, alternatives sufficiently explored and acknowledged? Are there multiple choices?
    - How would a contemplated action look prominently displayed in social media or the front page of the newspaper?
    - Would this action be "right" if everyone did the same? How would I feel if done to me?
    - How do I want to be remembered by those who care about me?
    - How transparent have decisional processes and outcomes been?
6. ***Reflection***
    - What factually happened?
    - Did expected outcomes occur? What was not expected?
    - What should have been done? Why wasn't it?
    - What should not have been done? Why was it?
    - Cover-ups often result in worse outcomes than initial mistakes

**Ethical Decision-Making: An Applied Structure Addressing Ethical Challenges, Fig. 1** Six-Step Applied Structure for Ethical Decision Making (Hartman et al. 2014; Kidder 1995; Paine 2007)

administrators and those facing ethical challenges, value-based and enabled by a stakeholder analysis, while dynamic in elements to be thoroughly considered. This process was created by the author but is highly informed by and draws or adapts certain elements from the research and analyses of many others (Gentile 2017a; Hartman et al. 2014; Kidder 1995; Paine 2007). It is outlined simply for introduction below as:

1. Determining **Facts**
2. Recognizing Ethical **Issues**
3. Identifying Applicable **Ethical Standards**
4. Seeking Required **Input/Expertise**
5. Maintaining Decisional **Impartiality** and **Transparency**
6. **Reflecting** on Outcomes (Fully described in Fig. 1).

### Determining Facts

In the *Parable of the Sadhu*, businessman and writer Bowen McCoy relates his team's dramatic encounter with a Nepalese holy man (the "Sadhu") who literally falls deathly ill into the planned climbing route of McCoy's team summiting the peaks of the Himalayas. Adding to McCoy's immediate dilemma of the Sadhu's fate are reminders of his own experience in a prior, yet failed, Everest climb where the unplanned intervention of others saved his life. Relating the struggle of making the decision *how* to respond to the unexpected ethical challenge whether to save the Sadhu or move forward through a narrow window of weather availability in his dangerous trek and goal of reaching the summit this time around, McCoy uses his story to reflect upon a number of individual and organizational challenges to ethical decision-making (McCoy 2007).

Among his observations, McCoy describes ethical decision-making as "making a tough call within a *muddle of ambiguity*." This statement is critically instructive to ethical decision-making. While ethical decisions require identifying objective "Facts," facts often remain uncertain, ill-defined, and not easily ascertainable. Some have analogized this factual decisional uncertainty to that experienced in combat and described as the "fog of war":

> War is the realm of uncertainty; three quarters of the factors on which action in war is based are wrapped in a fog of greater or lesser uncertainty. **A sensitive and discriminating judgment is called for; a skilled intelligence to scent out the truth** (emphasis added) (Von Clausewitz 1897).

"Facts" however remain things certain, known to exist or having existed. Even in light of contemporary political discourse regarding the uncertainty of scientific judgment, facts are discernable. While often described simply as "Facts," the first challenge in ethical decision-making lay as McCoy recognized in objectively "discerning" what they are (Lord et al. 1979).

Complicating the accurate assessment of facts and the process of decision-making, anxiety, stress, and fear in facing potential conflict with others due to ethical challenges can distort decisional process (Hertz 2013). Stress can subject a decision maker to tunnel vision, while anxiety can push one to more risk-averse behavior and deference to authority. However, studies suggest that mindfully acknowledging these feelings serves as an "emotional thermostat" to help recalibrate objective decision-making (Hertz 2013).

Facts that support hope in stressful moments also provide a dopamine-like rush and pleasantly deceptive reliability to decision makers. Knowing we tend to adjust our thinking if data is supportive, but tend to ignore information that contracts our pre-conceptions or outlook, is crucial to objectively recognizing critical facts (Hertz 2013). As Professor Hertz and others have concluded, while emotion and "instinct" are not to be simply ignored, cognitively framing decision-making can be invaluable to ethical outcomes.

To "discern" Facts though we must do at least **four things** critically and well:

(a) **First, "Stop and Think"**... *because before deciding* we often do not, but instead tend to rely solely upon our emotions when facing an ethical challenge
(b) **Actively listen** for "Facts," **aggressively pushing to realize pertinent information** informing our decision; **hearing what we need** to hear. *Paraphrasing many others, "bad" facts do not age well over time.*

(c) **Appreciate** those on our team or those reporting or seeking to inform us may hold **conflicting interests**, or appeal to our known or **perceived biases**. To offset potential hurdles, we must **voice an expectation to these stakeholders** that the full nature of facts (both information perceived as positive or supportive of our views and information that may challenge our predilections) underpins *ethical* decision-making.

(d) **Prepare to ask all providing information**, including those tapped for their expertise, **analytical, objective and probing questions** to both help neutralize bias and fully and factually inform the decision process.

### Identifying the Ethical Issues

Ethical issues can obstruct our predetermined objectives and unachieved goals (the figurative "Sadhu" obstructing our otherwise planned pathway or goal – (McCoy 2007)) long before we clearly understand the "Facts" surrounding an ethical challenge. While listed as the second procedural step, ethical issues often initially confront decision makers before the operative facts are known. These procedural steps may therefore be used interchangeably.

Stakeholder analysis begins to provide import to identifying ethical issues when we ask at least ***three questions***:

- Who is making the decision?
- What is or *should be* our role in the decision-making process?
- Who is affected by the decision, and in what manner?

The events in Flint, Michigan, again provide illustrative insight. If limited to a decisional perspective of taxpayer cost-savings alone in securing cheaper water resources, the decision maker's process risks narrowly and incorrectly identifying those significantly impacted as a consequence of the decision. This focus effectively circumscribes an economic decision from the broader ethical context of the disastrous impact upon affected stakeholders of the deadly quality of a publicly consumed resource.

### Appreciating Applicable Ethical Standards

If we are to apply standards and make decisions, what do we mean by "ethics"? (Paine 2007) With due respect to aged, extensive, and often divergent ethics philosophy theories, researchers, and authors (Ethics 2017), in the applied process used, "ethics" is generally defined as values across the organization (Beshers and Gino 2015; Gentile 2017b). While specific values vary, many believe there is a broad and fair consistency in their identification and presence, even across cultures (Gentile 2017b).

To outline and effectively implement values within ethical standards in a decision-making context, we must *look long-term* and **ask five fundamental inquiries** (Paine 2007).

- What is our **Duty**?
- What are the **Rights of Stakeholders** to be acknowledged and observed?
- What is **Best Practice** within our authority or public charge?
- What **Core Values** do we hold and **do they align** with the values of our Organization?
- How **are competitive** ethical duties, rights, best practice and institutional values and those we hold to be weighed and reconciled?

#### Duty

While it can be stated much more simply than uniformly applied, **the fundamental ethical duty of those in public service is to the "best interests" of the public** (Bozeman 2007). At least theoretically, this means where required, the self-interest of decision makers, the interests of others to whom they report and those of remaining stakeholders who may seek to influence decision-making, must all be subordinated to the best interest of the public. This is neither easily done nor consistently realized as Ethical Standards to be applied are analyzed.

**"Duty" is best described as an obligation to act or not to act in a certain manner** (Bozeman 2007; Paine 2007). (This analysis and question fundamentally presents a deontological perspective of ethical accountability.) Some would go so far as to say this obligation of "duty" in public service is that of a "fiduciary" duty to the public

that is it is *our sole responsibility* to decide and do what is in the best interests of the public (Ponet et al. 2013). In public administration, our duty means upholding the best interests of those to whom the greatest obligation is owed as we explore and weigh the interests and ethical alternatives of all stakeholders.

Duty (and Rights) may be dictated within law, codes of conduct, and regulation. Decision makers then need be familiar with and understand both their letter and intended spirit or seek the input of others who do. If not, decision makers risk the consequences of failing those dictates. In weighing competitive obligations, certain compliance provisions may effectively mandate an ethical duty above what appears to be the best interest of the public (Dist. of Columbia 2008). Informatively disregarding such a directed duty should not be lightly entertained and requires a deliberative weighing process as described further below.

### Rights

In application to stakeholders, **a "right" is the obligation decision makers must observe towards that specific stakeholder**. (While describing a deontological accountability, this analysis and question also invites an ethical social justice perspective of responsibility and fairness to the expectations of others.) Often competitive rights and duties are at the core of ethical decision-making in public administration.

As an example, applying competitive rights and duties in Flint's case of providing public water, the right of water users to clean and safe water may compete with the right of taxpayers collectively to decide the limits on what they pay for that resource or challenge the duty of regulators to certify water safety under governing standards.

Rights of the public to transparently participate in decisions through open public meetings and records are often specified in law or rules of process and directly impact decision-making.

### Best Practice

If duties and rights involve obligations, best practice in public administration is informed by and modeled to **standards and principles of excellence across similar organizations and the professionals** within them (ACM 1993; ASPA 2014). Best practice outlines conduct that is worthwhile but not necessarily subject to objective measures of action – some describe as "shoulds" or aspirational goals. Best practice often exemplifies aspirational excellence. (Best practice draws upon ethical concepts of "virtue" that exemplify character in the decision maker or outcome.)

The ASPA Code of Ethics provides a classic example of a code of ethical conduct and guidance for ethical action that lists aspirational goals and best practice for those in public administration (ASPA 2014).

### Core Values

Most organizations, either formally or as a matter of organizational culture, aspire to a set of values. Most individuals, across cultures and demographics, have core values upon which they act (Gentile 2017b; Paine 2007). These values can drive ethical decision-making (These are often seen as "commitments" made in the social contract of interaction with others (Paine 2007).). For example, if an organization states a commitment that all decisions within the organization must be made in public, transparency serves as a predetermined value in outcomes and may drive decisional procedure. If no duty or right dictates, or observation of best practice suggests, transparency, a public manager's core value of openness as an agency leader serves to promote transparency as a core value in agency decision-making.

Harvard professors have compiled a list of eight ethical Principles (so-called CODEX) commonly found in law, codes of ethics, and traditions across sectors that outline fundamental ethical norms and are derived from duty, rights, best practice, and values examination (Paine 2007). Those eight principles are: the Fiduciary, Property, Reliability, Transparency, Dignity, Fairness, Citizenship, and Responsiveness Principles. One or a combination of these values may serve as an anchor for decision-making in a public agency.

As with a conflict among duties, rights, and best practice, the values of the organization may not align with the core values of decision makers

within the organization and further require careful weighing of alternatives in ethical deliberations by decision makers (Redman 2014; Yates 2017).

### Weighing Process

The third step in process is to assess what duties, rights, best practice, and core values are applicable to each stakeholder and then *prioritize them*. As an over-arching ethical principle, while the "best interests" of the public may be a general and at times even an aspirational standard, maintaining such an ethical duty as a controlling "Purpose" or "Shared Value" in ethical decision-making and can guide weighing competitive ethical components (Gentile 2017c).

Decision makers must be both prepared and equipped to appreciate contemplated alternatives and their short-term and long-term impacts in order to identify who will likely seek to affect those alternatives in outcomes that are positive to the public interest as well those reflective of self-interest. While classification of stakeholders may be directed by existing procedure or best practice in varied public roles, decision makers must focus upon those directly affected by decisions and at the same time, not under-appreciate potential actors significantly affected by or who can affect the decision. The debacle of leadership failures in the recognition and priority of young boys as prioritized stakeholders in an educational institutional decision-making involving former assistant football coach Jerry Sandusky is instructive in this regard (Freeh and Sullivan 2012).

Weighing conflicting duties, rights, best practice, and core values from stakeholders in decision processes naturally contemplates available human and resource capital and other factors, such as public administration authority and the multiple complexities of implementation and execution. These can generate independent constraints upon decision-making. And there may in fact be multiple ethical choices from which the decision maker may be required to choose (Kidder 1995). If the focus is upon "ethical" decision-making with an overriding duty to the best interests of citizens however, the challenge of decision makers is not to ignore unethical outcomes or to promise ethical outcomes that are unlikely to be executable, but to use decision-making to best determine what action is the ethical outcome under applicable limitations exist or when the decision maker must attempt to overcome that limitations.

The process of outlining individual stakeholders and prioritizing aligned or competitive duties, rights, best practice, and values takes thorough and objective consideration and time. This is particularly apparent in the midst of "muddled" circumstances. While challenging, as the Flint circumstances outline, graphic examples of the failure to do so demonstrate worst-case public service failures.

## Securing Required Input and Needed Expertise

One challenge to leadership in ethical decision-making is knowing when to not only draw upon the needed input of stakeholders potentially impacted by a decision but also the specialized expertise of those smarter or more experienced within the subject matter central to the decision. Decision makers in Flint failed to do so (Gupta et al. 2016; Taillefer 2016; The Virginia Tech 2017).

As described immediately below, due to our own self-interest and innumerable cognitive biases, seeking the aid of an impartial but respected third party can help process difficult ethical challenges. To the extent allowed by conflicting duties and rights (for example, legal restrictions on confidential information), consultation with expertise should be implemented by offering those consulted the full complement of "Facts" of which the organization is aware or can determine.

Caution should be exercised to appreciate here that where consultation with an independent third party can occur, the decision maker should not expect to transfer the ethical duty to decide the ethical issue. The purpose of seeking insight is guidance and advice, not removal of accountability by the decision maker to ultimately make the decision. Taking the time to weigh alternatives and stakeholder responsibilities beforehand also equips the decision maker to enable an objective third party to recognize perspectives that are limited, ill informed, or potentially biased.

### Maintaining Impartiality and Transparency in Making a Decision

All processes and cognitive strategies are subject to assumptions and individual prejudices.

Research suggests that "inappropriate" self-interest may be unconsciously obscured in the decision maker, as a legacy survival instinct to protect ourselves from harm (Finkelstein et al. 2009). This creates an inherent challenge to decision maker objectivity; it is difficult enough to counteract recognized biases, let alone those for which we are unaware and may vehemently deny if others challenge. Perceptions of successes in past experience may in fact be self-interested or inaccurate (Barkan et al. 2012; Soyer and Hogarth 2015).

Cognitive biases in our decision-making and rationalizations of our actions are innumerable (Lee and Lebowitz 2015; Prentice 2004). For limited examples, "Moral myopia" may stymie initial recognition that ethical issues are even present in circumstances requiring a decision (Drumwright and Murphy 2004). Once the moral issue is recognized, "Cognitive dissonance" suggests that a decision maker may proceed to correctly identify core values and what should be done, but then choose not to act ethically, instead substituting rationalizations for why (Prentice 2004). Groupthink and obedience to authority can critically derail ethical outcomes when ethical choices are abandoned (Janis 1971; Prentice 2004). Continually expending resources on a failed choice can result in a refusal to explore ethical alternatives – the so-called sunk costs failure in decision-making (Prentice 2004).

To compound the difficulty in proposing a cognitive strategic process to decide ethical questions, researchers in behavioral psychology and neuroscience initiatives suggest that decisions are often irrational and that solely using process without appreciating this irrationality to decide critical issues can be shortsighted (Ariely 2010, 2016; Kahneman 2011).

While impartiality and objectivity are cornerstones of attempting to choose an ethical path, deciding what to do and implementing that choice in an open and transparent fashion is a foundation of stakeholder support. The absence of transparency can quickly lead to an appearance of ethical impropriety, what is often described in terms of the "optics" or "appearances," regardless of outcomes. As most experienced in public decision-making are aware, appearances should not be dismissed and can themselves be damning to the public servant and to the action of a public agency.

Occasionally, ethical decisions require voicing core values and the courage to challenge the alternative inclinations of team, peers, supervisors, or significant stakeholders, or in rare cases, the dictated standard of applicable rules or law. While appreciating the hurdles and rationalizations in doing so, appealing to over-riding norms (such as the "best interests of the public") may help define this challenge and implement ethical decision-making in these circumstances. The refusal of direct command or the decision to ethically choose a course against superiors can be extremely difficult (Yates 2017).

It must be noted here that no choice, or a choice *not* to act, *is a decision*. While alternatives may ethically demand further input, or ultimate choices by those with superior or alternative authority, a failure to decide a recognized ethical need (whether by inaction, process inattention, or the failure to prioritize), all constitute decisions, and may themselves result signify ethical failure (Yates 2017). The decision maker should be aware, however, that even the best ethical choice may not have positive outcomes for either the decision maker or all stakeholders.

To offer to maintain our directional "true North" in the compass of decision-making, many practical tests have been suggested to confront these concerns (Paine 2007). **Five are noted for decision makers in public service**:

- Reminding ourselves that we all are self-interested and need question how our initial assessment fundamentally conflicts with those stakeholders directly affected in light of the best interest of the public. Which perspective is objectively most supported by the Facts and which less supported, *acknowledging our self-interest*?

E

- How would a contemplated action look to others if prominently displayed in social media, for example, on my Facebook page or the prominent story of a major news outlet? – *so-called newspaper or Visibility test*.
- Would this action be "right" if everyone did the same? How would I feel if done to me? – *so-called Generality test*.
- How do I want to remembered in my leadership by those who care about me? – *so-called Legacy test*.
- Have diverse stakeholders and creative, yet ethical alternatives been sufficiently explored? Is there a third or fourth option, other than simply "yes" or "no"? (Kidder 1995). *A broad and open recognition of stakeholders may* identify ethical options *not* envisioned by the decision maker.
- How transparent have decision processes and decisions been?

### Reflection Upon the Decision and Its Outcomes

Within public administration, time is not only a threat to considered ethical deliberation but to the opportunity to reflect upon decisions made in order to critically measure outcomes and discover neglected alternatives. Contrasts to this failure to 'look back and learn' readily exist and occur in many decision-making situations. Ethical decision-making and choice are also heavily influenced by past experience, but the failure to objectively examine or to accurately remember what transpired other than in a manner most favorable to the decision maker, can derail a future ethical course relying on that faulty memory (Ariely 2010, 2016; Kahneman 2011).

**Six** inquiries can again help us to review and reflect upon our actions:

- What took place factually?
- Did expected outcomes occur? What outcomes *were not* expected?
- What should have been done? Why wasn't it?
- What should *not* have been done?
- In either of these last two, not recognizing unethical decisions *and* deciding to hide what occurred (the so-called cover-up) is *neither* a viable *nor* an ethical option. – *The choice to cover-up misconduct often ends badly.*

## Conclusion

No decisional methodology will inoculate against unethical decisions or guarantee ethical outcomes. Recognizing that ethical challenges are not usually solved by an ease of choice frees decision makers to appreciate that cognitive process steps may not only aid making the correct choice but may help protect against misinformed or self-interested stakeholders who would otherwise challenge the fairness or transparency of decisions. Assuring core values align with those of the organization in a process of stakeholder consideration can reaffirm core ethical principles. It also increases the likelihood of diverse and creative ethical alternatives that may not otherwise be envisioned or explored from narrowed decisional process perspectives.

While ethical decision-making is not easy, the failure to fully explore ethical alternatives and the consequences to stakeholders of outcomes can be devastating to the public, as well as to those found to be short-sighted in decision-making – just ask those stakeholders in many public ethics scandals – the Flint, Michigan lead-tainted water debacle – but just graphic example

# Ethical Dilemmas in International Development Nongovernmental Organizations

Richard K. Ghere
University of Dayton, Dayton, OH, USA

## Synonyms

Moral decision making in international development

## Introduction

On a global scale, the population of international development NGOs attending to missional priorities such as reducing poverty, improving quality of life, and advocating for human rights has expanded exponentially since the end of the Cold War. This in turn has heightened competition for scarce donor resources and empowered donors to demand that NGOs cultivate professional practices relating to governance structure, reporting procedures, and performance documentation. Although a few development organizations are relatively large and well funded (e.g., Oxfam and CARE International), many more are small (50 and fewer employees) and under-resourced. Thus, NGO leaders find themselves caught between a constitutive legitimacy of service for their beneficiaries and a representational obligation to meet donors' expectations (see Peruzzotti 1997).

First used by the United Nations in 1949, the term *nongovernmental organization* resists tight definition as it has been applied to a broad spectrum of organizations (Fernando and Hilhorst 2006, p. 10). Delineating those organizations that function specifically as *development* NGOs, distinct from *humanitarian* organizations, is vexing as well. The traditional distinction between "humanitarian" relief as a short-term, politically neutral undertaking and "development" as a more sustained, politically entangled effort has become clouded as humanitarian organizations have reacted to the charge of attending to the "well-fed dead" in conflict settings (see Barnett 2005, p. 728); in other words, many humanitarian agencies have taken on longer-term (development) initiatives to improve security or living conditions beyond their initial relief efforts.

Given these definitional problems, the term "development NGO" as used herein refers to a nongovernment organization that implements programs of significant duration to improve human conditions in the (so-called) developing world. That organization may be based outside of the assisted society – i.e., in the "developed world" – or, alternatively, within that society as a "local" NGO.

The international development literature offers benchmarks that delineate the ethical terrain on which NGO professionals function to the extent it identifies key value-based dilemmas they confront on a frequent basis. Thus, the focus here is on moral decision making at the executive level rather than upon matters of personal conduct in agency operations. The next five sections address the following ethically grounded leadership dilemmas (1) interpreting/managing "meanings" of ideas about "development," (2) reconciling "formal" and "informal" organizations, (3) deciding whether to contract with governments or corporations, (4) documenting "quality-of-life" improvements amid donor demands for hard data, and (5) investing in personnel management at the expense of resourcing core mission initiatives.

## Interpreting/Managing "Meanings" of Ideas About "Development"

Words, terms, and discourses matter strategically in framing (or shaping) what "development" means in particular settings and what ought to be "taken for granted" about problems and priorities. Terms that convey policy ideas like "empowerment" and "poverty reduction" are seldom if ever neutral but instead implicitly advocate particular understandings and courses of action. In essence, these words "succeed" when they achieve a "taken-for-granted"

status or consensus within a range of diverse perspectives. In her analysis of development discourse, Cornwall refers to terms having achieved such status as *buzzwords* that "get their buzz" from being in vogue, which serve as passwords to funding and influence (2007, pp. 471–472).

As do most organizations, development NGOs can exploit selected definitions of buzzwords (such as "poverty" and "empowerment") internally in order to animate organization cultures and ideologies. That "word power" can in turn affect key decisions in a number of sensitive areas such as hiring, promotion, selectivity in rule enforcement, and interpersonal relations. In rhetorical terms, development NGOs (to the extent of their resource capabilities) may opt to extend their "knowledge," that is, propagate meaning among peer organizations (Broad 2007).

Yet most NGOs find themselves on the receiving end of knowledge-management efforts to embed particular meanings of buzzwords into the institutional vocabulary of the pertinent development sector. At minimum, organizational leaders need to be aware that the ambiguous nature of the development "enterprise" presents political opportunities to control narratives in ways that advantage particular actors. Moreover, these leaders would be well-advised to cultivate interpretive skills among staff members to enable them to deliberate competently in fora where institutional meanings take shape.

Presumably, the core ethical problem surrounding the management of meanings within international development sectors is that of a power asymmetry whereby well-funded organizations have the wherewithal to define norms, "problems," and remedies for others to "take for granted." As suggested above, leaders of NGOs on the receiving end of meaning dissemination bear the ethical responsibility of promoting interpretive competence among professionals in their organizations.

## Reconciling "Formal" and "Informal" Organizations

As Smillie and Hailey conclude in *Managing Change* (2002), leaders steer development NGOs through the crosswinds of formality and informality at various organizational life stages. How NGO leaders balance external pressures for *governance* and accountability structures with the internal workflow of the organization is critical in determining the organization's effectiveness in serving beneficiaries. Increasing emphases on NGO governance since the 1980s appears somewhat paradoxical. On the one hand, northern neoliberal institutions (i.e., those advocating free-market policies) have looked upon NGOs as autonomous agents equipped to democratize not-so-democratic regimes. But on the other hand, it is precisely that autonomy that raises the eyebrows of donor institutions calling for more rigorous governance and accountability controls.

Appeals for strong governance measures prompt leaders to institutionalize formal, or at least well-established, accountability mechanisms within NGOs. But to what extent should day-to-day organizational work, in the interest of "responsible governance," be formalized or structured at the cost of disrupting the synergies of team-oriented work? Elaborating on the balance between formal governance mechanisms and the informal work culture, Smillie and Hailey question whether organizations are managed more effectively through formal systems and controls or left to consensual processes that motivate staff and facilitate collective learning (2002, p. 166).

In their study of particular South Asian NGOs, Smillie and Hailey suggest that leaders support informal processes to the extent they buffer the staff from information demands placed on them. Although information is vital for staff learning, demands for excessive documentation, case study reports, and fieldworker diary entries can crowd out collaborative efforts that support interactive strategy formation. One leader rejected demands for documentation, claiming, "We are implementers, not researchers – I don't have the funds or time for process documentation." Another NGO founder echoes the sentiments of the first, maintaining, "If we get in the documentation business, it consumes a lot of time, at least 30% of the time we could spend in four or five villages" (2002, p. 86). Thus, leaders can opt to balance the formal and informal as gatekeepers who minimize the external reporting demands that warrant the attention of staff.

On the other hand, NGO leaders may opt for structure in governing development work with the hope that donors will reward "disciplined" accountability with subsequent program contracts. Such motives conform to a rational, "businesslike" logic that program success in one global setting can be replicated (or "scaled up") in others. Here the leader sacrifices autonomy for fiscal sustainability. Yet those who value bottom-up local participation in development settings disparage such structured approaches.

At first glance, leadership dilemmas involving whether to buffer the day-to-day operations of development work from donor scrutiny (and to what extent) might be cast as an ethical problem that pits a moral imperative (i.e., tell the truth to donors) against the consequences of straightjacketing the development professional – or alternatively, the virtue of empowering people through maximum participation. But an ethical justification for buffering staff development activities from formalistic scrutiny by no means preempts possible donor repercussions. It therefore might be prudent for NGO officials to take proactive steps to apprise donors (as well as other stakeholders at a distance from the development setting) as to the intricacies of work in progress half-a-world away with hope that they might "buy into" the organization's work strategies.

## Deciding Whether to Contract with Governments or Corporations

Some international development NGOs opt to enter into contractual partnerships with governments or corporate entities, thereby risking their autonomy to act on behalf of their beneficiaries. In the case of government partnerships, the NGO's role as service provider in the civil society is sometimes referred to as "gap filling," suggesting that they "let governments off the hook" by assuming responsibilities for costly and challenging public functions (Whaites 1998). Thus, the contracting dilemma lies at the crux of the conflict between *constitutive* and *representational* legitimacies.

The contracting recourse can offer distinct opportunities for development organizations in particular contexts. For example, a program director of Save the Children in Pakistan and Afghanistan reports on how his area-based NGO assists multinational athletic equipment conglomerates by monitoring the child labor practices of local subcontractors stitching soccer balls (Husselbee 2000). In addition, it would be prudent for NGO leaders to partner (or network) with other NGOs – particularly grass roots – and indigenous organizations not highly dependent on international aid. But as a general proposition, it could be said that an NGO's decision to contract with a governmental funder significantly limits its options to advocate for the rights of beneficiaries and maintain the integrity of development or humanitarian missions.

There appear to be few if any generalizations to be drawn regarding the ethics of development organizations' initiatives to contract with government as a major funding source. Any such judgment would need to examine the particular context to determine whether (and how much) autonomy and mission integrity are traded-off for how much material support – and for what public (or state) purpose. The vantage point of those casting ethical judgments – whether from a nationalistic commitment to regime values or an advocacy for a universal ideal – seems pertinent to this ethics quandary.

## Documenting "Quality-of-Life" Improvements Amid Donor Demands for "Hard" Data

The further one moves from quantifiable NGO outputs – wells built, credit provided, trees planted, people trained, buildings constructed, and so on – to impacts on people's lives, the more significant intangible factors (such as socioeconomic divisions, power relationships, human motivation, individual and collective behavior, cultural values, and local organizational capacity). In other words, where it matters most, at the end of the international aid chain, human development results from a complex mix of nonlinear processes which are largely determined by external factors; in other words, it is an open system. By contrast, performance measurement closes the system by

positioning the user (or evaluator) *outside* of that under scrutiny.

"Results, of course!" is what donors expect of development organizations. Yet those donors could find it difficult to clarify exactly what they mean: what kinds of results, based on whose definitions of goals, how significant those results are and on what scale, and so on. In development NGOs, the logical framework (or logframe) typically embodies the deductive nexus between programming and planning and subsequently offers the evaluative criteria for monitoring project success. For example, a project to improve children's health in a rural (poor) local village might link various development objectives (e.g., "Children or estate laborers in X district enjoy better health than earlier."), indicators (e.g., "frequency of treatment of relevant diseases, health personnel's statements, mothers' statements"), and indicators for evaluation (e.g., "height, weight/age, frequency of diarrhea") (Dale 2003, p. 63). Thus, it appears that stakeholders, such as donors, furthest removed from grassroots development work highly value the logframe methodology, while those closest to development work generally discredit it.

Development professionals can navigate, and in some cases preempt, this "quality of life/demand for hard results" dilemma by pursuing either of two leadership strategies or drawing from both. First, they could opt to improvise or customize the generic logical framework planning blueprint to adapt to unique or changing circumstances encountered during program implementation; in addition, such improvisation might enlist local participation into "logframe" planning activities such as establishing goals and objectives or endorsing planning assumptions built into the document. Beyond this, donors and agencies can move beyond measuring outputs to assessing longer-term impacts, both intended and unintended, of quality-of-life initiatives.

Second, NGO leaders can strive to reconfigure the agency's/program's funding base in ways that reduce dependence on one particular corporate donor or funding source. Both strategies essentially call for NGO leaders to manage the accountability expectations of donors. Development NGOs that pursue quality-of-life improvements often depend upon educational and self-awareness program components that defy predictable outcomes. Such agencies may fare better if the fund portfolio is "diversified," consisting of several smaller donors rather than one or two major funders. Additionally, NGO leaders might be well-advised to seek out the equivalent of "venture capital" revenue sources from foundations that encourage development innovations and experimentation in human capability-building and are therefore willing to offer recipients some flexibility in how they document outcomes.

At first glance, some observers might opine that development administrators would be ethically obliged to follow a *third option* (not discussed above) – strictly complying in reporting "results" to donors in reference to outputs stipulated in the logframe planning document. Such a viewpoint would look to categorical imperatives such as "do not lie" or "tell the truth" as the overriding moral standard applicable to this dilemma. Yet complex situations may call for multi-perspectival analysis whereby a categorical (deontological) interpretation might be balanced against virtue- and consequentialist-based logics. In that this matter affects multiple stakeholders, it seems that that the standards of virtue and consequence (particularly in terms of improved quality of life) warrant strong consideration.

## Investing in Personnel Management at the Expense of Resourcing Core Mission Initiatives

For a variety of reasons, humanitarian and development organizations typically confront "people problems" that in some cases compromise capabilities to implement programs. But unfortunately, many NGOs find it difficult to support a viable human resources operation. According to organization development trainer Vijay Padaki, the human resources management *orientation* of rights-based and humanitarian organizations should be distinctly developmental or focused on

capacity building, in contrast to the regulatory purposes of HR in public organizations. He argues that if the HR function is truly developmental, then its management cannot simply consist of a "bag of [control] tools" but must instead emerge from "a sound body of theory and methodology" related to how HR management builds NGO capacity (2007, p. 66).

Yet as Padaki asserts, human resources development is sometimes perceived more as a liability than an asset within humanitarian organizations because of its costs in relation to scarce resources and the burdens it places on operational managers (Henry 2004, pp. 57–58). For Padaki, the availability of personal counseling emerges as especially important for development workers given common occurrences of role stress in the forms of alienation, emotional load, responsibility load, and work–living imbalances during assignments (Padaki 2007, pp. 71–72). But, as he suggests, the accompanying costs of staff well-being pose an ethical dilemma for humanitarian agencies "*spending on themselves* . . . made possible by *spending somebody else's money*" donated to assist distressed people outside the organization (2007, p. 71; italics his). Advocates of vibrant human resources programs regard the pervasive attitude associating NGO efficiency with minimal administrative (e.g., under 5% of total) costs as simplistic.

Padaki's argument that NGOs should opt to invest in human resources for *developmental*, rather for *organization control*, purposes speaks to the complexities of the labor market from which these agencies draw. In a nutshell, development agencies cope with chronically high turnover, since many serve on a temporary basis as volunteers, interns, or professionals (such as physicians) on "service leave" from their regular careers. Moreover, other employee distinctions – such as between ex-patriate and in-country workers – spawn inequities in the workforce that lead to burnout, perceptions of inequality, and poor morale. These problematic contexts temper Padaki's subsequent assertion that decisions to invest in human resources amount to agencies opting to spend money on themselves rather than programs benefitting clients.

As with the previous dilemma, ethical consideration of the complex trade-offs surrounding small NGO decisions to investment in human resources raises questions of priority among obligations to stakeholders. It is understandable that the intensely problematic nature of the NGO labor market (short-term stints, more applicants willing than able, wide variations among employee types, and so forth) accounts for consequentialist motives for attending to personnel matters. Still, a virtue ethic calls NGO leaders not to sacrifice direct investments in core missions to cover the costs of additional staffers. But in this case, the categorical imperative of "doing no harm" stands out as especially salient. Workers (particularly women) who serve in remote development settings deserve some measure of physical safety as well as psychological support to counteract burnout and senses of isolation. Interns who undertake tasks comparable to those of full-salaried workers need some form of nonmonetary benefits that recognize their work initiatives. Although parity is virtually unattainable in these turbulent environments, development agencies should demonstrate tangible concerns for the dignity and well-being of those who labor to achieve development objectives.

## Conclusion

International development NGOs most often act *independently of government* in the absence of sovereign power or authority within themselves. In promoting and facilitating "development" (however defined), these NGOs usually function as agents of change, sometimes in conflict with regime interests to maintain the political and social status quos. Yet NGOs must rely on donors (different than taxpayers who are theoretically service recipients) who are distant and perhaps unfamiliar with the specific conditions "on the ground" that affect development efforts. Thus, as Peruzzotti asserts (1997, pp. 46–55), the NGOs' ethical terrain is characterized by a *constitutive* (rather than by a *representative*) legitimacy that supports advocacy for particular constituencies.

Administrative ethics; Communitarianism; Ethical decision making; Ethical theories; Public health ethics

## Introduction

This entry will examine three different frameworks for ethical decision making in public administration: democratic systems theory, application of constitutional principles to individuals, groups, and the larger community, and communitarianism. These frameworks will be examined using examples from the public health field, as this is an area of public administration where many different levels of ethical decisions must be made on a regular basis. Specifically, this entry will examine ethical frameworks in the context of public health emergencies and research using genetic information from newborn screening.

Most recently public health agencies have been tasked with preparing the U.S. for a threat posed by the Zika virus, but this is only the latest such threat. Different emergencies have forced the U.S. to confront different ethical considerations. H1N1 forced the U.S. to consider how a limited supply of vaccines, ventilators and other medical countermeasures could be fairly distributed. Ebola forced the U.S. to consider the appropriate conditions under which to keep U.S. citizens in quarantine and restrict travel to and from the country. The threat of the Zika virus has caused some countries to call upon women to delay pregnancy, and in the U.S. those who have travelled to Zika-affected countries are being asked to abstain from unprotected sexual activity for a prescribed period of time.

Such actions by the government, which involve abdication of liberty on the part of the citizen, must be made with ethical standards in mind. A 2015 report by the Presidential Commission on the Study of Bioethical Issues described ethical decision making in the midst of a public health emergency as the mark of a nation "committed to national and global health" (p. 3). Ethical considerations that must be taken into account include the harm principle, the principle of least infringement, beneficence and non-maleficence, and reciprocity (Presidential Commission for the Study of Bioethical Issues 2015). Such reports look back retrospectively at public health responses to help us learn from the past. They

should also serve as reminders that we must always be improving our governance systems to prepare for the next emergency.

Another highly salient issue involving bioethics is protecting genetic privacy and the question of ownership over genetic material. The use of blood collected for the purposes of screening newborns for heritable disorders in secondary genetic research has recently sparked legal controversies in several U.S. states. One recent example where the issues of property and privacy rights associated with genetic material came into play is the case of *Bearder, et al. v. State of Minnesota, et al*. This case began in 2009 when 10 sets of parents filed suit against the Minnesota Department of Health (MDH) over what they saw as a misuse of blood samples collected as part of the newborn screening process. The department was storing the blood and providing the samples to other research institutions, including the Mayo Clinic, without getting informed consent from the parents (Drabiak-Syed 2011).

After rulings at the district and appellate levels that were favorable to the department of health, the state's Supreme Court found that the department was not legislatively empowered to store the samples or share them with other research institutions without informed parental consent. The justices also found that the blood samples met the criteria for genetic information under the Genetic Privacy Act (Pribek 2011).

The Minnesota Supreme Court's ruling required the destruction of infant blood samples being stored by the department of health (Featherly 2012). The ruling also resulted in passage of new legislation aimed at providing parents with more information about the newborn screening process prior to a child's birth as well as making them more aware of how blood samples will be used. Any storage or use of the blood beyond the initial screening required parental consent, and the law specified that parents can opt of the testing and revoke consent even after the blood has been drawn (Thornton 2012). The bill was signed into law by Minnesota Governor Mark Dayton on May 10th, 2012 (Snowbeck 2012). A later bill passed in the state does permit the Minnesota Department of Health to store blood samples indefinitely unless parents complete a form specifically requesting to opt out (Tsai 2014). According to the web site for the Citizens' Council for Health Freedom, Minnesota is one of seven states with the opt-out provision, along with Michigan, Missouri, New York, South Carolina, Texas, and Washington (Citizens' Council for Health Freedom n.d.). Other states request that parents complete forms opting in to the research.

The question of whether state departments of health should be permitted to retain and disseminate the genetic information of newborns highlights a social rift in the United States regarding genetic research and genetic rights. Parents like those involved in the Minnesota law suit seek more control over what becomes of their child's information after screening is completed, whereas researchers see only minimal risk involved in the use of newborn screening material for genetic research with the potential for great reward from new breakthroughs.

At the heart of both the public health emergency response and newborn screening research issues is citizens' demand for accountability from government. If the government is going to require that any citizen relinquish personal liberty, make personal information available for research, or take any other action placing the needs of the community above their personal rights, citizens want to know that the government has given appropriate consideration to the ramifications and has adequate safeguards in place to protect people or information from abuse. The ethical frameworks discussed throughout the rest of this entry help to provide guidance for these ethical deliberations by highlighting safeguards built into the democratic system and emphasizing the need to consider decisions' effects on individuals, groups, and the community at large. The interests of the community at large are particularly at issue in the communitarian framework, which argues that citizens' responsibility to society must sometimes outweigh their personal rights. It is clear that ethical behavior precludes government trampling on the rights of citizens. At the same time, government must encourage ethical behavior among citizens when it comes to acting in the best interests of all.

Ethical behavior is expected of all public servants. The manner in which we define ethics can vary depending upon whether you are consulting an academic, a practitioner or a citizen. Henry David Aiken notes that ethics involves conceptions of the good, the right, and the ought. However, he adds that in the course of normal practice ethical considerations are given different levels of serious and systematic reflection. Aiken writes that people first react to new situations on an emotional level, but eventually progress into a consideration of moral rules and ethical analysis. Moral rules are defined as the axioms that people try to abide by in daily life. These are often acquired through socialization, either through friends, family or co-workers. While Aiken notes that many problems can be resolved at the level of moral rules, these decisions tend to be ad-hoc and lack systematic analysis. While this might allow day-to-day office issues to be resolved using moral rules, they are likely inadequate to deal with larger issues (Aiken 1962).

Such situations are likely to require what Aiken calls ethical analysis which involves the application of a principle that links a value with a mode of action. For example, in trying to decide what people should have priority access to a vaccine or drug during an emergency, we could start with the principle of fairness: all citizens should have an equal opportunity to access the medicine, regardless of means. An action that could be taken subsequently would be to grant priority access to individuals with the most severe symptoms or at the most severe risk, regardless of socioeconomic standing or other factors. After considering the problem at this level and arriving at a solution, one may have to consider it at the post-ethical level, which calls for people to think about why they should act in an ethical manner. Thinking at this level may come about after a person receives criticism for the solution they arrived at during ethical analysis. At this level, a person may need to rely on their own personal philosophical or religious worldview to stay true to their ethical decision making (Aiken 1962).

Aiken's views are equally applicable to the issue of informed consent requirements for the use of newborn screening information in research. Public health officials and researchers may at first object to parental requests for informed consent and more control over the use of their child's genetic information. However, at the level of a moral rule, such officials may concede that as employees of the government, they have a responsibility to safeguard patient privacy and address the concerns of the public to make sure that the research using newborn screening information is viewed as legitimate. They may then couple that value with efforts to better educate parents about the use of newborn screening information in research and creating stronger policies to make sure that parents are not only given an opportunity to consent, but fully understand what they are consenting to. Public officials may receive criticisms for such policies, so in post-ethical analysis they will justify their actions to themselves and others using their own ethical perspective. Such officials may argue that even though these steps may create barriers to research to some degree, government has a duty to protect the rights of citizens and to make sure that initiatives promoted by government, such as research, are conducted in an ethical manner.

As noted by Terry Cooper (2006), the consideration of ethics in public administration can be complicated by the postmodern approach to the field, which has called into question commonly understood foundations for structuring and administering public organizations, as well as establishing ethical norms within them. One outcome from the postmodern view of public administration, according to Charles J. Fox and Hugh T. Miller, is a focus on decentralization as opposed to centralization in government (Fox and Miller 1996).

During the early twenty first century, public health agencies at the local, state, and federal level have experienced a reduction in financial and personnel resources, making it difficult for them to perform some of their core functions. In this environment, ethics, while an important consideration in the broader sense, may not be given explicit consideration at the daily operational level. This can be observed in public health emergency planning, as officials can become so busy with the organizational, logistical, and

bureaucratic work associated with these efforts, as well as other responsibilities, that they must share them with private or non-profit partners. Meanwhile, advances in the field of genomic research are opening up new avenues for finding more effective treatments for prevalent and devastating diseases. At the same time, the federal government, as well as state governments, is providing increased incentives for biotechnology firms and other research institutions to take full advantage of these new methods. With a great deal of emphasis placed on the medical and economic benefits of new discoveries, questions of ethics can be deemphasized in the policy discussion.

This has important implications for many aspects of public health. On one hand, decentralization can allow for quicker, more decisive action and more flexibility in how government can respond to a new situation. On the other hand, government must be cognizant of the loss of direct control and make a concerted effort to monitor partners to make sure they are behaving equitably, efficiently, and ethically.

Government may take the approach of trying to instill tenets of public ethical practices in non-governmental partners. Terry Cooper (2006) describes the working ethic as determining how a person behaves ethically in their position over time, leaving one with a predisposition to behave in a certain manner. Cooper argues that externally imposed codes of ethics will prove ineffective unless one has a well-developed working ethic. There is significant value in public health agencies forming broad collaborations with community partners in the public, private, and non-profit sector, but these partners may have their own views on ethics, further complicating ethical norms.

The rest of this entry will look at three ethical frameworks that may be used by government officials to guide decision making in complex public health scenarios, such as managing access to limited resources during an emergency response or striking the appropriate balance between protecting personal privacy and promoting research as it relates to genetic information. These frameworks focus on how to respond to policy imperatives while taking into account the unique rights and responsibilities of individuals, groups, and communities in a constitutional system.

## Ethical Frameworks

One way that ethics can be conceptualized and operationalized under complex circumstances is through the adoption of ethical frameworks. Such frameworks can be based upon the values and norms of a democratic society, consideration of the different constitutional protections accorded to individuals, groups, and society, or the adoption of a communitarian ethical approach. One thing that these frameworks have in common is what Terry Cooper would call objective responsibility. This concept involves the joining of accountability and obligation. In regard to government officials, they are responsible to the public for performing certain tasks (Cooper 2006). Looking specifically at public health officials, they are responsible for enforcing rules and taking actions to protect the public from contagions and contamination. As we will discuss later, certain ethical frameworks, such as communitarianism, place a certain degree of accountability and obligation on the citizenry as well.

## Democratic System Principles

Under the framework involving democratic system principles, elements that must be present include protection of freedoms, a hierarchy of control, the opportunity for decisions to be reversed, and decision making by elected officials through which the will of the people can be heard. These concepts are in line with other ethical frameworks in public administration, including Paul Appleby's idea of "democratic morality" (Appleby 1952). Lawrence Gostin is an authority in the field of public health ethics and has written extensively on the need for government to carefully balance the need to take decisive action to halt an outbreak and the individual rights of citizens not to have their personal freedom infringed upon (Gostin 2010). Deontological ethics holds that an ethical person will remain true to values

such as justice and equity regardless of the consequences. This branch of ethics also holds that people should never be used as a means to an end (Masserly 1995). This is an important consideration in regard to genetic research, as using individuals' genetic information without their informed consent could be viewed as a violation of deontological principles.

While one of the primary goals of government must be to protect citizens' lives, ethicists argue that this must be done within a system that is just and equitable for all citizens. Lawrence Gostin and Benjamin Berkman (2007) write that government can compel individuals to participate in a public health intervention, but they must first draw a clear link between the intervention and mitigating the existing threat. Rights theory also applies, as citizens have the right not to have their freedom of association taken away through the imposition of quarantine or isolation without due process and a clear public policy interest.

Protection of freedom, particularly personal privacy, is a concern in regard to the use of newborn screening information in genetic research. Parents express concern that their children's genetic information being included in research databases could place them at risk of being discriminated against later in life based on an existing disorder. Researchers counter that identifying information is removed from the samples and that there are already federal and state laws banning the use of genetic discrimination. However, research has shown that it is possible match an apparently anonymous sample back to the individual it was collected from (Gymrek et al. 2013) and it is possible that laws could be changed in the future. Regardless of whether the use of newborn screening information represents a true risk to the child or not, informed consent has for decades been a bedrock principle of human subject research. Children are supposed to enjoy special protection because of their inability to offer mature consent. Therefore, making sure that parents are given the opportunity to approve or disapprove of the use of their infants' information is a reasonable safeguard to allow parents to protect their child's rights.

Another aspect of the U.S. democratic system that is intended to preclude implementation of unethical or illegal policy is the presence of a hierarchy of control. Policy is made and reviewed at the local, state, and federal level, and under the federalist system these levels of government should act as a check on each other. In some situations, higher levels of government can require lower levels of government to implement policy. However, if a lower level of government considers requirements placed upon it by higher levels of government to be unconstitutional or unreasonable, they can challenge the policy directive through judicial action or other approaches. Public administration scholars often refer to the principal-agent theory, in which objective responsibility for policy-making can be determined by identifying those with the primary right to exercise authority (principals) and those with the responsibility to carry out directives (agents). The federal government claims considerable power to make policy in the area of public health from the Necessary and Proper Clause in the U.S. Constitution, as well as its constitutionally granted spending authority. Much federal policy, including in the area of public health, is implemented by agents of state and local governments. While this gives the federal government a certain degree of power over the states, it also gives the state and local governments the opportunity to influence policy through the implementation process.

It is important in a democratic system to understand the extent and limitations of authority for different government institutions. James G. Hodge writes that the U.S. does not have a centralized public health system, blurring the boundaries between local, state, and federal authority (Hodge 2002). For example, in the case of public health administration, the Centers for Disease Control and Prevention cannot go into a state and unilaterally command action. Rather, they must be invited by the state and local government. Therefore, any directives handed down by the CDC represent guidance, not orders. A significant Supreme Court case, *Jacobson v. Massachusetts*, decided in 1905, found that state power supersedes federal power in the area

of public health. On the other hand, under extreme circumstances, the federal government can take action like restricting travel to and from the United States, or even within the United States. During the recent Ebola outbreak, a number of states enacted mandatory 21-day quarantines for travelers returning from Ebola-affected countries, with some of those affected challenging the policy in federal court and winning. While most policy is the result of power-sharing throughout the federal system, state and local actions contradicting the U.S. Constitution or federal law can ultimately be overturned at the federal level. Federal emergency laws also exist, giving the U.S. government sweeping powers in an extreme emergency. While this federal power must be exercised judiciously, it serves as a check on abuses at the state and local level, with the judicial branch serving as a check on all. If functioning properly, this multi-tiered system should promote responsible and ethical decision making.

Regarding the issue of genetic privacy as it relates to newborn screening information, several states had, for decades, engaged in a policy of conducting research using remaining blood samples without parental consent. When parents became aware of this situation, they took the public health departments and research institutions in question to court in attempt to reassert control over that genetic information. This was due in part to the lack of an overarching federal policy on how newborn screening samples should be handled and whether informed consent was necessary. While the federal government has instituted some policies to promote genetic privacy interests, such the Genetic Information Nondiscrimination Act, they had not addressed this particular question. The passage of the Newborn Screening Saves Lives Reauthorization Act of 2014 helped to fill this gap by requiring that parental consent be obtained before using newborn data for research in the future pending revisions to the Common Rule governing human subject research (CRS 2014). It did not explicitly address how to deal with samples already collected.

Going along with this notion of accountability is the principle that ethical decision making in a democratic system should originate with elected leaders. One aspect of responses to events like public health emergencies that may create apprehension in the public is the appearance that policy is being made by unelected officials in public health agencies, rather than elected leaders. Gostin (2010) writes that a decision to engage in a significant public health intervention should result from a deliberative process within the government that protects democratic principles such as due process of laws, equal protection under the law, and an appropriate balancing of public and private interests. Public health scholars such as James F. Childress have noted the importance of government answering certain key questions before exercising police powers during a public health emergency. These questions involve the types of responses justified, the limits on the government's ability to coerce citizens into cooperating, and whether or not adequate steps have been taken to protect vulnerable populations (Childress et al. 2002). Government should also be as transparent as possible regarding the necessity of action. Terry Cooper notes that in a pluralistic society, public accountability involves the requirement of a reasoned application of ethical principles and the need to be prepared to explain and justify conduct when the public demands it. Decisions made at the level of ethical analysis tend to be the easiest to justify to citizens and political officials (Cooper 2006).

The demand for accountability is why many state governors took a very public role in the implementation of policy responding to Ebola, in comparison to the federal face of the response tending to be representatives of the CDC or National Institutes of Health. While actions taken may ultimately be the same, citizens may more readily accept limitations on their freedom if the policies originate with an elected official who can be held directly accountable. It is important to note, however, that such restrictions on freedom should be in the framework of a larger legal and operational response to an emergency. This principle can be seen when comparing the Ebola responses in the U.S. states of Connecticut and New Jersey. In Connecticut, Governor Dannell Malloy introduced a mandatory quarantine policy

early in the emergency, but placed it within a larger strategic framework to better equip the state to respond to the current emergency and prepare for emergencies in the future. After declaring the emergency, Malloy assembled an interagency team to oversee the conducting of hospital preparedness drills, see that hospitals completed preparedness checklists, and implement secondary screening procedures for international flights (Benson 2014, October 16). New Jersey's policy, alternatively, drew more criticism because it was not presented as part of a larger strategy, but rather a response to the federal government's refusal to enact a mandatory quarantine or a travel ban. Even New York governor Andrew Cuomo, who announced a mandatory quarantine policy alongside Governor Chris Christie, noted that quarantines must be part of a comprehensive strategy (Bidgood and Zernike 2014, October 30). Decisions on such issues are best made within the democratic context because it makes it clear that elected officials who can be held accountable at the ballot box are responsible.

In the area of genetic privacy, government officials were once heavily engaged in creating and overseeing policy to protect the public from potential negative externalities arising from genetic research. However, over time Congress' orientation toward genetic research shifted from one of protection through regulation of potential harms to one of promotion to reap the economic development benefits of the science (Sheingate 2006). Now there is evidence from the passage of legislation like the 21st Century Cures Act (H.R. 6 2015) and the creation of the President's Precision Medicine Initiative (Precision Medicine Initiative n.d.) that elected officials have become more engaged in promoting research and its subsequent products than regulating the development or use of these products. Therefore federal legislators are reluctant to create requirements like those mandating parental consent for newborn screening, but do so in the face of a situation where lawsuits are destabilizing research efforts around the country, resulting in the destruction of millions of genetic samples. It should be noted, however, that recent policies, such as the 21st Century Cures Act passed in the U.S. House of Representatives and a proposal to change the Common Rule governing human subject research (Hudson and Collins 2015), have actually moved toward reduction of informed consent protections, raising new ethical concerns.

Accountability also means that a mechanism is in place to reverse decisions that are found to be unethical or illegal. As noted previously, in a democratic system that mechanism is the judiciary. Scholars like Norman Daniels have argued that accountability should not only be in place to retroactively address an incorrect action, but should be a part of the original decision making process. Daniels proposed a system which he calls "accountability for reasonableness." Under this system, he prescribes transparency regarding the grounds on which decisions are made, appeals to commonly accepted rationales, as well as opportunities to revisit decisions in light of new evidence (Daniels 2000). Sofia Gruskin and Norman Daniels note that not only can transparency in decision making lead to greater acceptance of the eventual policy, but it can also help to increase broader social learning about the importance of public health (Gruskin and Daniels 2008).

Such a model is seen as particularly useful when making decisions in situations like public health emergency responses when there is an absence of adequate resources. Organizations like CDC have long acknowledged that in the event of a severe and widespread public health emergency, there may be an inadequate supply of ventilators, medical countermeasures, and other resources. An ethics subcommittee of the CDC has developed ethical guidelines for use by medical professionals in such emergencies (Ethics Subcommittee 2007). Decisions about giving certain groups access to medical resources at the expense of others is certain to be controversial, but Daniels holds that if different sides can find common ground, if the reasoning behind the decisions is clear, and if there is an opportunity to revisit decisions in light of changing circumstances, these decisions can be made without paralyzing response efforts.

On the topic of protection of newborn screening information, some attempts have been made to institute processes similar to those prescribed by

"accountability for reasonableness." Newborn screening advisory committees at the state and national level have advocated for educational processes that give parents a better understanding of how newborn screening information is used in research and the methods used to protect it, with the hope that such processes will create a shared understanding of the nature and value of such research. The decision concerning which type of informed consent process to use, whether requiring parents to explicitly opt-in to allowing genetic information to be used or opt-out to prevent the use of the information, should also be clearly explained to parents and other stakeholders. Experience has already shown that parents and others are more than willing to go to court to demand the reversal of newborn screening policy with which they disagree. However, if more communication occurs from the beginning and the informed consent process is more transparent, it will hopefully reduce the burden on the court system.

## Constitutional Perspectives on the Rights of Individuals, Groups, and the Community

As noted above, one approach to maintaining ethical decision making in the face of emergencies is the accountability inherent in democratic system principles: protection of freedom, hierarchy of control, the context of democracy, and the opportunity for reversal. In the U.S. system, our democracy is founded upon the U.S. Constitution, which serves both as a blueprint for our government and an enumeration of rights. Lawrence Gostin notes that the U.S. Constitution grants national and state governments powers with which to protect public health, while at the same time curbing the means by which they can legally do so. Gostin advances criteria such as necessity, reasonable means, proportionality, harm avoidance and fairness to evaluate the constitutionality of public health actions (Gostin 2010). The courts act to interpret to what degree interventions infringe on the rights of individuals, groups, and the community at large. This application of the Bill of Rights to different units of society represents another ethical framework. We can see an example of differing attitudes toward the treatment of different units in society in the debate over travel restrictions during the recent Ebola pandemic. In regard to individuals, some leaders at the national level proposed that any U.S. citizen returning from an Ebola-infected country should be placed in mandatory quarantine. Some of the same legislators called for a complete stop to all travel to and from Ebola-infected countries. While not enacted at the federal level, some restrictive policies were enacted at the state level. Such restrictions directed against individuals and groups, while viewed by some as unconstitutional and violating ethical principles, were proposed with the rationale that they would serve to better protect the larger community.

As noted above, individual privacy rights and the right to ownership of genetic material are at the core of controversies over the use of newborn screening information. Such controversies have shifted over time from a focus on property interests associated with biological samples to a focus on the need to protect individual privacy relating to the information that can be produced from genetic testing. Both formulations of the issue raise important questions and potential obstacles for scientific research. The formulation of the body as property envisions the person as separate from the body and thus able to distribute different portions for different purposes, whereas the privacy formulation sees the person and the body as inextricably linked, making any use of a person's biological material without authorization an invasion of personal privacy (Rao 2007). Rao (2007) states that privacy rights can be claimed in situations where individuals' personal health information could be subjected to public scrutiny, but not in cases where the issue is commercialization of genetic information. She argues that privacy policies associated with informed consent offer inadequate protections because they allow one to decide whether or not to provide material for research purposes, but do not allow one to exert any control over how the material is used.

Research involving newborn screening information is even more complicated from an ethical perspective, because parents are called upon to

make a decision on behalf of the child that could potentially affect the child later in life. There are questions regarding whether children should have the right to withdraw their samples once they reach adulthood. Some argue that all people who contribute genetic material to research should be empowered to make decisions on how it will be used. Whether or not genetic information collected for research could ever be used against an individual, if our genetics are the foundation of our identity there is a strong ethical argument that we should have some say in how that information is used.

Groups that require particular attention when it comes to ethical considerations in public health policy are vulnerable and at-risk populations. It is widely agreed that the needs of such individuals must be taken into account during any planning for a public health emergency response (Gruskin and Daniels 2008). However, this group holds little economic or political power and may be less visible and less able to actively access resources during an emergency. Therefore, in the event that there is a shortage of resources their needs may be at greatest risk of being overlooked. This highlights the importance of not only designing policy with an eye toward different units within the community, but making sure that meeting the needs of those who are less accessible is required in the operationalization of that policy. Lack of equitable treatment and access to services under the law can raise serious overall concerns about public health policy.

Similar concerns have been raised by genetic researchers who have been accused of not treating certain groups with appropriate respect. One often-cited example of this was the treatment of members of the Havasupai tribe by genetic researchers who collected genetic information for diabetes research but then used that data for other research without getting consent from members of the tribe. Members of minority groups such as Native Americans can take greater offense from this type of treatment because of past discrimination. Therefore it has been recommended by Native American researchers and others that those seeking to study members of these groups put in the work to develop relationships before the study begins and also have a clear understanding of the history of the groups as it relates to the research. For groups like the Havasupai that have had their property and cultural identity infringed upon in the past, taking genetic information and using it for research without consent is viewed by many as a significant violation. However, it is argued that this can be overcome with education and collaboration (Eveleth 2015).

While there is now more institutional focus on at-risk populations, there was once a heavy emphasis on utilitarianism when it came to balancing the needs and rights of individuals as opposed to the larger community. Those actions were deemed ethical that created the greatest good for the greatest number. Utilitarianism, for example, would consider placing hundreds of people in quarantine against their wishes if there was even a 1% chance they were infected with a virus to be ethical if it served to protect the lives of thousands. Teleological ethics, which is often associated with utilitarianism, involves evaluating the ethics of an action based on the end produced and the potential consequences to society (Childress et al. 2002). The counterpoint to this is deontological ethics, which argues that duty to certain principles, such as fairness and equity, should be upheld regardless of the actions. In this ethical perspective, people should never be used as a means to an end, whether in the context of a public health emergency intervention or attempting to advance genetic research.

This perspective would take a dimmer view toward quarantining those with a statistically small chance of infection, because it would mean a serious infringement on their individual rights in return for a minor boost to public safety. There is more of a question when it comes to newborn screening research, since evidence suggests that the potential benefits for medical research usually significantly outweigh the risks. Terry Cooper (2006) notes that in the practice of public administration it is often difficult to separate duty and consequences. The duty to take action to protect the public health cannot be separated from the consequences if one fails to act. Alternatively, the duty to obtain informed consent from parents for the use of newborn screening

data cannot be separated from the consequences of lost data due to people opting not to give consent. On the other hand, if a researcher uses data without consent because of a sense of duty to the research, that action cannot be separated from the consequences of subsequent legal actions. This approach to ethics can be seen in the ethics guidance documents of organizations like the CDC, who, as part of their planning, must promote policy guided by ethical principles while still being mindful that in an emergency serious resource constraints are likely to exist and restrictive actions may need to be taken to protect the larger public (Ethics Subcommittee 2007). Similarly, government-funded organizations like the National Human Genome Research Institute provide guidance on their web site regarding the importance of informed consent and how to best design informed consent documents ("Informed Consent for Genomics Research" n.d.).

James F. Childress and other public health scholars argue that government action during a public health emergency must infringe upon individual liberty to the least extent possible (Childress et al. 2002). John Rawls advocated for a system of government in which personal liberty is given priority over the arrangement of social and economic inequalities. Rawls writes that at a certain point it becomes irrational to sacrifice a degree of personal liberty for marginal gains in general social and economic welfare (Rawls 1971). Rawls believed that such a system would still result in moral behavior because "a moral person is a subject with ends he has chosen, and his fundamental preference is for conditions that enable him to frame a mode of life that expresses his nature as a free and equal rational being as fully as circumstances permit" (Rawls 1971, 561). This system would, for example, allow parents to freely make choices about whether or not to have certain vaccinations administered to their children if they perceived a potential threat, without prioritizing the larger societal immunity created by cumulative vaccinations. It would also give license to people to make decisions about whether or not to share genetic information with researchers, regardless of the potential benefit to the community. Any problems created by such policy could be addressed, in Rawls' view, by people entering into voluntary social unions based on their interests and taking a more active role, either through direct participation or representative government, in the making of laws.

Michael Sandel critiqued these ideas as leading to a procedural republic, which he saw as a threat to civic engagement and recognition of civic responsibility. Sandel noted that individuals derive much of their personal identity from their membership in a community. He also saw dangers in the concept of the procedural republic, including making people fearful of the notion of majority will and shifting more decision making responsibility to non-elected arms of government like the bureaucracy and the courts (Sandel 1984). In regard to an issue like vaccination, Sandel might argue that, although there is some degree of risk and loss of personal liberty involved, for society to maintain a high level of overall health and institutions to continue to remain strong, individuals must be willing to accept them. Similarly, Sandel might argue that individual citizens should engage in active dialogues on issues like genetic research in order to make the best ethical choice in terms of weighing personal risk against society gain.

The use of democratic system principles as an ethical safeguard hinges upon government's accountability to its citizens. In the case of different constitutional perspectives toward the relationship between individuals, groups, and the community at large, government accountability is certainly important. Government should always be prepared to explain its rationale for limiting the freedoms of some in the name of the greater good. Ethicists like Sandel (1984), however, suggest that individuals also must be accountable to society as society creates the institutions through which they can achieve full self-actualization. With this in mind, citizens should weigh the value of the exercise of their individual prerogatives against the potential effects that exercise will have on society. In this view, individuals and groups should always be protected by the Constitution against the tyranny of the majority. However, citizens and groups can be discriminating in

regard to when and how they choose to exercise those rights. This is particularly true if individuals and groups have the capacity to help the larger community without any significant risk of harm to themselves.

## Communitarianism

This brings us to another ethical framework relevant to public health policy, communitarianism. Amitai Etzioni, director of George Washington University's Institute of Communitarian Studies, has noted that there are two types of communitarians. Authoritarian communitarians evaluate an individual's worth based on their contribution to society, viewing citizens largely as an appendage of society. Responsive communitarians take the position that ethical decisions should emerge from efforts to find a proper balance between the common good and individual rights. While authoritarian communitarianism is viewed as incompatible with a democratic society, responsive communitarianism has gained some significant support in the U.S. Responsive communitarianism calls upon policy makers and citizens to consider not only rights in their decision making, but also responsibilities (Etzioni 2011a).

In regard to public health response, Etzioni believes that coercive efforts by the state are likely to prompt resistance among the citizenry, and alternatively calls for public health officials to make appeals to commonly accepted societal values, based on education, persuasion, and social norms (Etzioni 2011b). In Etzioni's view strong responsibilities are a necessary counterpart to the exercise of strong rights. However, the government can be most effective by creating a space in which citizens can exercise those responsibilities. This is in line with the view that education, relationship building, and collaboration can aid people in minority populations that have experienced mistreatment in the past to see the value of participating in genetic research (Bonham et al. 2009).

Looking at a previous example of a parent choosing whether or not to have their child vaccinated, in a number of states parents have the right to claim an exemption. However, communitarians would argue that when making such a decision, parents should not only consider their concern for their child and their right as a parent, but also the implications of their decision for society as a whole. A communitarian might acknowledge that vaccination presents a certain degree of risk, but it is their responsibility as a citizen to assume a reasonable level of risk in order to protect the larger community. Many in American society may feel uncomfortable with the idea of advocating that citizens make sacrifices for the "greater good," given America's long-standing suspicion toward collectivism. However, if ethicists like Sandel are correct in noting that individuals need society to achieve their full potential, then making such sacrifices is not entirely a selfless act (Dionne 2012).

Similar arguments could be used in regard to parents opting in to allow their child's genetic material to be used in research. While it is recognized that this may present some risk to the child, it could save or improve the lives of many other children. Whether making decisions for themselves or their children, citizens must think critically about the level of harm they are assuming as opposed to the benefits that could be derived by others and the magnitude of that benefit.

E.J. Dionne, in his book *The Divided Political Heart*, quotes William Galston, a Communitarian philosopher who noted that liberal societies depend upon stable families and stable families depend on virtues like fidelity. At the same time, to effectively raise children to adulthood requires adults to go far beyond their own self-interest. In Galston's view, if we want a society that values freedoms like those provided for in the First Amendment, we must encourage all adults to exercise personal responsibility. That responsibility applies not only to their actions in their personal and family life, but to the need to exercise a concern for all children. Therefore, when making decisions on issues such as vaccination or participation in genetic research, one ought to take into account not only the well-being of one's own child, but the well-being of other children as well (Dionne 2012). Government could help in this regard, according to scholars such as James F. Childress and P. Edward French, by promoting

policy through building community, as opposed to issuing mandates in the name of community (Childress et al. 2002; French 2011). This can be done by better incorporating citizens in public health preparedness efforts or creating opportunities to more actively involve parents in the planning of genetic research.

Communitarianism could be seen as linked to the idea of virtue ethics. According to this ethical perspective virtuous people behave virtuously because of their disdain for unvirtuous behavior, possess practical wisdom (understanding of the consequences of their actions), and eudaimon (happiness that comes from living a virtuous life) ("Virtue Ethics," 2012). According to virtue ethics, decisions related to balancing individual rights and community well-being may be based on the fact that one sees certain actions as irresponsible, perceive potentially serious consequences from such actions, and derive pleasure from doing what they perceive to be the right thing. This again points to people taking ethical actions for self-interested, as opposed to selfless, reasons. Regardless of the motivation, many people have a desire to do good for others, but may be hesitant because of concern for their own safety or concern for the safety of a loved one. Making people feel like they are a part of a process, whether in a public health intervention or research, can help to alleviate this obstacle.

## Conclusion

Accountability is at the core of all the ethical frameworks discussed above. Large-scale public health responses are becoming an increasingly visible aspect of government services. Over the last decade, we have seen responses to the H1N1 virus, Ebola, and now the Zika virus, not to mention other smaller scale but still serious threats. As citizens, we expect the government to address such emergencies with effectiveness and efficiency, but also in an ethical manner. The same holds true for genetic research. We want to see steady progress in finding treatments for diseases. However, most citizens would agree that this progress should not come at the expense of the safety of patients and research participants. Government must demonstrate that it has taken adequate steps to protect lives, property, and privacy. In short, government must behave ethically. With that in mind, it is important for citizens to consider how to evaluate ethical behaviors under such conditions.

In regard to the democratic system ethics framework, government must be accountable to the people in explaining why any infringement upon freedom is necessary. Different levels of government should hold each other accountable and controversial decisions should involve elected officials that are directly accountable to the people. Opportunities should also exist to overturn actions later found to be inappropriate.

In regard to different perspectives on how to balance the rights of individuals, groups, and the larger community under the U.S. Constitution, government must be held accountable for making every effort to explore alternatives before choosing a path that takes freedoms away from particular groups or individuals. Decisions to do so should be based on a rational analysis of available evidence, and not just on uncertainty. The needs of groups considered to be particularly vulnerable or at-risk should be given particular consideration to make sure that their needs are met during the implementation of response efforts, even as they receive increasing attention during planning efforts.

The previous two frameworks also call indirectly for accountability on the part of citizens to be informed and to participate in policy debates when possible. Communitarianism calls for more accountability on the part of citizens to weigh their personal choices and freedoms against what is best for the larger community. The ability of government to provide more efficient and accountable responses would be improved if more citizens would focus as much on their responsibilities as they do on their rights.

Each new public health emergency, or any type of disaster response, will spur new conversations about ethics in government. We are fortunate that there are some systemic safeguards in place to prevent government officials from crossing certain ethical boundaries, and that our judiciary can

provide relief when those boundaries are crossed. Nevertheless, we as citizens should be continuously reevaluating our role in and contribution to these efforts. Increasingly complex problems may require more advanced citizenship, and ethical requirements do not just extend from the government to the citizens, but from citizen to citizen as well. It is notable that the report of the Presidential Commission, media coverage of the Ebola response, and scholarly work by French (2011) all indicate that higher levels of citizen engagement in preparation for a future emergency could lead to more effective responses.

The same holds true for the field of genetic research as well. Most Americans clamor for the day when scientists will defeat devastating diseases such as Alzheimer's. However, the process for achieving such feats may not allow us to be simply passive observers. At minimum citizens should educate themselves on the use of genetic information and separate fact from unsubstantiated fiction. Citizens can also work to educate others and look for opportunities to get involved with advocacy groups promoting responsible research. Some citizens may be called upon to participate on advisory boards, or even to contribute genetic material for research, either their own material or their child's. When such opportunities arise, citizens will hopefully have the knowledge to evaluate the level of risk and make an ethical determination on the best course of action.

As noted previously, with the threat of birth defects posed by the Zika virus, a number of countries, including the United States, have asked their citizens to make adjustments to their personal behavior in order to help slow the spread of the virus. In testimony before the U.S. House Committee on Oversight and Government Reform in February 2016, Dr. John Armstrong, Florida's Secretary of Health, noted that they are asking residents in the state who travel to countries with mosquito-borne cases of Zika to abstain from unprotected sexual activities for at least a month after their return to Florida. They are also calling upon Florida's citizens to take active measures to prevent infection, such as eliminating standing water, using mosquito repellant, and wearing protective clothing (Armstrong 2016). Such proactive measures indicate that if we are to avoid situations where the most difficult ethical choices must be made, citizens should accept some ethical responsibility to assist the government in managing the situation in early its stages.

Some nations, such as Estonia, already operate a national biobank that contains genetic information from approximately a quarter of its citizens (Schwab 2015). Efforts to expand biobanks are ongoing here in the United States, particularly in relationship to a concerted federal government effort to find a cure for cancer (National Institutes of Health n.d.). The concept of biobanks can be unsettling for some, as it raises questions and concerns about how the government will use that information. Given past government abuses, such concerns are not without merit. At the same time, citizens should not simply rely on default prejudices when making decisions about supporting such efforts. Rather, citizens should gather as much information on a particular project as possible and make their own decisions about its merits.

The challenges of the future in regard to public health, medicine, and science in general may require the active participation of millions in the U.S. and around the world. This participation should not be based on citizens abandoning their ethical judgment to the judgment of others, but rather citizens and government appealing to appropriate ethical frameworks to maintain democratic processes, protect the rights of individuals and groups, and act in the best interests of communities. This will ensure that government remains accountable to the people, and citizens are accountable to each other.

# Ethical Impact Theory: How Unethical Behavior at Work Affects Individual Well-Being

Robert A. Giacalone[1], Mark Promislo[2] and Carole L. Jurkiewicz[3]

[3]McCormack College of Management, University of Massachusetts Boston, Boston, MA, USA

## Synonyms

Consequences of unethical work behavior; Effects of immoral actions at work; Health outcomes of work behaviors

## Definition

Ethical impact theory (EIT) is a theoretical framework that delineates the effects of unethical work behavior on individual well-being.

## Introduction

Multiple streams of research have demonstrated that ethics is related to job-related outcomes (e.g., job satisfaction, organizational commitment). Studies show that ethical work climate, leadership support for ethics, ethics codes, ethics training, and perceived corporate social responsibility are all linked with positive effects in the workplace (such as lower turnover) (e.g., Mulki et al. 2008). The perception of corporate ethical values is even positively related to group creativity.

In contrast, ethical impact theory (EIT) (Promislo et al. 2013) focuses on the individual, nonfinancial effects of unethical work behavior on employee well-being. EIT adopts a human-centered approach to workplace ethics advocated by Giacalone and Thompson (2006). The theory posits that unethical behaviors can lead to diminished well-being (psychological and/or physical), either directly or indirectly. Further, EIT asserts that the impact of unethical behavior is mediated by three mechanisms – stress, trauma, and poor health behaviors. Various factors may function to moderate the impact of unethical work behavior; in other words, not all immoral actions lead to diminished well-being in people (or to the same extent). Lastly, EIT expands the range of people affected by unethical work behavior; as will be discussed, it is not only the direct victims of immoral acts who are impacted negatively.

## What Kinds of Unethical Behavior Cause Decreases in Well-Being?

EIT proposes that all types of unethical behavior, from minor deviance to large impactful decisions (such as those made at companies like Enron), can impact individual well-being. EIT is largely derived from an extensive assessment of research in three areas of study, namely, discrimination, bullying, and injustice.

The literature on discrimination as an unethical act links it to detrimental effects on both psychological and physical well-being, including cardiovascular issues, sleep problems, anxiety, and mental health troubles (e.g., Klonoff et al. 1999). In effect, being victimized by workplace

discrimination can lead people to experience serious mental and physical problems.

Even more robust are research findings on the harmful effects of bullying by peers and by supervisors (which can include actions such as public humiliation, verbal abuse, isolation of workers, and physical intimidation). Bullying is linked to depression and low self-esteem, anxiety, job-induced stress, insomnia, and even suicide (e.g., Zapf et al. 1996). Thus, there is clear evidence that those who are bullied at work suffer a range of negative, even sometimes fatal, outcomes.

Third, research on organizational injustice link this form of unethical behavior to increased morbidity and mortality, coronary heart disease, sleep disorders, and absenteeism (e.g., Kivimäki et al. 2005). It appears that being treated unfairly at work puts people at risk not only of suffering from a range of ill effects, but actually dying early.

In summary, the above three types of unethical work behaviors have consistently been found to negatively affect employees' well-being, both psychologically and physically. Obviously, this is a non-exhaustive list; other forms of unethical behavior can also lead to diminished well-being in people. Moreover, even these troubling results regarding the victims of unethical work behavior do not paint the whole picture of the toll taken by such actions. For a more complete view, we must look at an expanded range of the people involved.

## Whose Well-Being Is Damaged?

Generally, researchers have focused on the direct victims of unethical behavior (Giacalone and Promislo 2010). Certainly the victims of unethical acts are the easiest to identify and the first set of people we tend to think about in these cases. But a concentration on victims alone ignores the other potential people harmed by unethical actions. Indeed, EIT suggests that unethical behavior leads to diminished well-being for three other categories of people: the perpetrators, witnesses to the act, and others indirectly involved (e.g., coworkers, family, and friends) that are termed "associated persons."

Interestingly, those perpetrating unethical acts can be harmed by the very behaviors they have engaged in. They may behave unethically but still feel incredibly uncomfortable doing so, too weak to resist the pressures they face but cognitively distressed by their own behaviors (Evans et al. 2007). Then, stressed by guilt and the fear of being caught or the shame they may face, they experience harm to their well-being, either psychologically or physically.

Individual witnesses of unethical acts may also have their well-being undermined. Whether it is a function of the shock of witnessing the act or via vicarious harm from attachment to others, witnesses to unethical workplace behavior can be harmed in one of three ways: their empathy for the victim impacts their well-being (Pearlman 1999), viewing the act creates a fear of being similarly victimized, or witnessing the unethical behavior shatters their worldview, their conception of their organization, or the character of society itself (Janoff-Bulman 1992).

Unethical behavior can impact well-being for those who simply hear about a disturbing incident and do not necessarily witness it firsthand. Knowledge of societal harms or family victimizations, even without directly witnessing these acts, can harm the knower's well-being, as much as working in a group with a high level of sexual harassment can create distress, even without being directly subjected to the harassment (Glomb et al. 1997).

Finally, the well-being impact of an "associated person" is a function of that individual's strong connection with the perpetrator, victim, or witness. This creates an emotional connection to the distress of the other person. Considerable evidence supports the negative impact of unethical behavior on associated persons; for example, the children of parents who are victims of violence report higher levels of distress symptoms (Dulmus and Wodarski 2000).

## How Does Unethical Work Behavior Diminish Well-Being?

Generally there are three primary mechanisms linking unethical behavior to reductions in well-being: stress, trauma, and poor health behaviors.

The stress mechanism creates cognitive, emotional, and motivational changes (Jackson et al. 2006) for the perpetrator, victim, witness, or associated person. The emotional reaction to unethical behavior largely depends on which "role" a person plays in the situation: perpetrators may feel guilt and victims can become angry, while witnesses may be outraged or perplexed. Meanwhile, associated persons can experience a range of different emotional responses, including shame for a connection with the perpetrator or empathy for those impacted. Individuals also can be stressed by violations of their guiding ethical standards, feelings of vulnerability, and repeated exposure to harmful events (e.g., Hobfoll 1988).

The trauma mechanism provides another way individuals can suffer diminished well-being from unethical behavior. Because ethical violations can destroy critical assumptions about the world and how it functions (Koltko-Rivera 2004) and erode trust in people or institutions that we depend upon, decreases in well-being are possible. Findings on post-traumatic stress disorder show that victims of PTSD have experienced decreased well-being as a result not only of natural disasters and violent acts but also through workplace events such as corporate downsizing (Moore et al. 2004).

Research shows that individuals who are traumatized can suffer serious psychological and physical effects, resulting in increased morbidity and mortality (Schnurr et al. 2002). Further, people can experience secondary (or vicarious) trauma, which is "the transfer of trauma symptoms from those who have been traumatized to those who have close and extended contact with trauma victims" (Motta and Kefer 1999, p. 997). Those who experience such secondary trauma, whether by witnessing or hearing about a traumatic event, can suffer from long-term stress, and the effects can be very similar to those experienced by direct victims.

Finally, in the health behavior mechanism, increases in unhealthy habits and activities or decreases in beneficial health habits (e.g., exercise) occur as a result of unethical work behaviors. Unhealthy habits include excessive alcohol consumption, poor diet, smoking, disturbed sleep patterns, and poor compliance with medical regimes. Research has shown that people exposed to trauma exhibit such poor health behaviors and unhealthy habits and that these behaviors are associated with a range of adverse physical outcomes (Walker et al. 1999).

It is important to note that the above three mechanisms are not mutually exclusive; in other words, an unethical act can result in activation of one or more of these paths toward diminished well-being. For example, a victim of sexual harassment at work becomes traumatized which directly leads to negative effects on her health; meanwhile, she may engage in unhealthy behaviors such as drinking in response to the trauma. Subsequently, the drinking itself leads to diminished well-being.

## What Factors Can Moderate the Decline in Well-Being?

EIT asserts that the relationship between unethical behavior and well-being can be moderated by several factors – that is, not all who engage in, are victimized by, witness, or are associated with unethical behavior suffer diminished well-being or to the same extent. The moderators that determine whether people suffer diminished well-being can be categorized into three groups: perceptual variables, sociodemographic variables, and coping behaviors. That is, how people view unethical behavior, their demographic characteristics, and how they attempt to cope with immoral actions all play a part in how the behavior ultimately affects them.

Perceptual variables can include such factors as personality, perceived magnitude of harm, and centrality to one's worldview or identity (e.g., March 1993). Meanwhile, some of the most important sociodemographic variables include gender, race, and socioeconomic status. Lastly, coping behaviors can provide resources (e.g., problem-solving skills, social networks, and financial and physical assets) to help people respond to unethical behavior in the workplace (Folkman 1984).

## What Aspects of Well-Being Are Affected by Unethical Behavior?

The literature shows that a wide range of well-being outcomes, assessed via both self-reports and objective sources (e.g., medical records), are related to unethical behavior. These outcomes can be placed into three broad categories of well-being. Psychological disorders are the most frequently studied impact of unethical actions, including measures such as anxiety, depression, burnout, and PTSD (Elovainio et al. 2002).

Physical health measures reflect a mix of self-reported health measures and more objective clinical diagnoses and have been implicated in a host of unethical behaviors such as bullying, injustice, criminal victimization, workplace harassment, and discrimination (e.g., Pavalko et al. 2003). Finally, physiological measures are least commonly found in the literature but provide assessments that are not subject to self-report biases. Many of these studies explore cardiovascular health, such as increases in blood pressure. Other research has focused on body mass indices (BMI) and the birth weight of infants of mothers exposed to unethical events.

## Conclusion

In summary, ethical impact theory provides a framework to better appreciate the human consequences of unethical behavior in the workplace. By focusing squarely on individual well-being, the theory proposes that immoral actions at work take a heavy toll on people's lives, both psychologically and physically. Importantly, these effects are seen not only in the direct victims of unethical behavior but also in a wider range of people who are not typically considered. It is only by studying the effects of unethical work behavior in a more holistic way that our ability to respond effectively to this phenomenon will grow.

Although EIT focuses on individual-level outcomes, it is likely that the effects on well-being extend to the group, organizational, and societal levels as well. External stakeholders such as investors, customers, and local communities are all negatively affected by unethical workplace behavior. These broader effects should be studied in future research, since EIT has public health implications.

# Ethical Issues in Nonprofit Organizations

Christine Gibbs Springer
University of Nevada, Las Vegas, NV, USA

## Synonyms

Argument; Contention non-profit – charitable; Controversy; Ethical – honest; Honorable; Humane; Philanthropic; Principled issue – concern; Problem

## Definition

Ethical means morally correct and honorable (DK 1998).

Issue is a point in question and a subject of debate.

Nonprofit means an organization not involved in making a profit.

## Introduction

Ethical issues in nonprofits are difficult to define and also to resolve. A 2008 Brookings Institution survey found that about one third of Americans reported having "not too much" or no confidence in charitable organizations and 70% felt that charitable organizations waste "a great deal" or a "fair amount" of money. Only 10% thought charitable organizations did a "very good job" spending money wisely; only 17% thought that charities did a "very good job" of being fair in decisions; and only one quarter thought charities did a "very good job" of helping people (Light 2008). Similarly, a 2006 Harris Poll found that only one in ten Americans strongly believed that charities are honest and ethical in their use of donated funds. Nearly one in three believed that nonprofits have "pretty seriously gotten off in the wrong direction." In a 2015 Harris Poll, attitudes toward giving were most often characterized as an option not a responsibility for individuals, and only 21% saw charitable contributions as a personal responsibility (Birth and The Harris Poll 2015). These public perceptions are particularly troubling for nonprofit organizations that depend on continuing financial contributions. It is important to remember the following:

- Nonprofits operate with public support and they need to grow and maintain the public's trust.
- Nonprofits do not pay income tax on revenues; thus they are indirectly supported by all taxpayers.
- Nonprofits seek financial support from the government and private foundations in the form of grants, and they ask community members and corporations for donations.

- Nonprofits must maintain high standards of transparency and integrity if they hope to maintain the support of the community and donors.

To address these issues successfully, nonprofits should have clearly articulated missions and value statements that are enforced organizationally. They should not get involved in situations with gifts that would lead them to compromise their stated values. They should develop a code of ethics that all staff are required to sign as part of their contract with the organization. And the leaders of the organization (executive director, president, board of directors) should uphold the shared values of the organization and set the cultural tone. A strong organizational culture that supports high ethical standards will have tremendous influence both in the community and on employee behavior.

## Ethical Issues

Recent books have discussed ethical issues involved in social workers treating immigrants and refugees as well as the management of human behavior in public and nonprofit organizations when thinking, behaving, and managing conflicts are critical to ethical behavior (Chang-Muy and Congress 2016). These issues are similar to those identified by the Stanford Social Innovation Review in 2009 (Denhardt et al. 2016). The first is **compensation**. Nonprofit organizations sometimes find themselves walking a thin line when it comes to compensating their employees. The sector may be nonprofit, but it's by no means noncompetitive. Organizations looking to hire the best and the brightest in their fields must offer attractive salary and benefit plans. If, however, a salary package is deemed in excess of reasonable compensation, the IRS may impose intermediate sanctions on both the individual receiving that salary and the organizational managers who approved it. Salaries that are modest by business standards can cause outrage in the nonprofit sector. For fundraising professionals often spend a lot of their time on percentage-based compensation which can result in their profiting from donations to their organization. Making a personal profit should not be what motivates a fundraiser to elicit donations.

The second area is **conflict of interest**, which arises frequently in the nonprofit sector because of the very nature of the sector's composition. Nonprofit boards are generally made up of community members, many of whom are private business people. This leads to the potential of a number of ethical questions. Should board members obtain contracts for their company? Are the board member's disclosure and abstention from a vote enough? Should a major donor receive special privileges? Detailed, clear conflict-of-interest policies can answer these questions and help the organization maintain public trust. Giving preferential treatment or lucrative contracts to major donors creates conflicts of interest in a large number of nonprofit organizations. A lack of transparency is also common in the nonprofit industry, allowing organizations to easily cover up contacts and services provided to those with personal relationships held by officers of the nonprofit, their employees, and family members.

The third area identified by the Stanford Social Innovation Review is **publications and solicitation**. Nonprofits must be clear and transparent in all publications and in all solicitation for funds about the percentage of funds spent on administrative costs. If an organization maintains that every dollar donated will go directly to the people served, they must be able to demonstrate the truth of that statement. Most organizations cover administrative costs with some unrestricted donor dollars and will need to educate donors about that reality. Transparency and accountability are crucial. Organizations cannot afford to raise funds on the basis of misguided assumptions or to violate public expectations in the use of resources.

The fourth area is **financial integrity**. Nonprofit organizations also face ethical dilemmas in deciding whether to accept donations that have any questionable associations or conditions. While some organizations restrict who they will take funds from – e.g., Mothers Against Drunk Driving won't take funds from alcohol companies

and the American Cancer Society won't take money from tobacco companies – many other groups don't make such distinctions. Should an organization that works with people affected by cancer take money from a tobacco company? Should a women's study program take money from Playboy? A vast number of nonprofits lack effective strategic plans regarding the use of funding. As a result, programs are not as successful as they could be if the organization applied more diligence to its budgeting practices and spent money raised for a specific purpose on that program. Each organization must reach their own decisions on how to address these questions; however, appearances matter, and it sometimes makes sense to avoid affiliations where questions may arise or when the intentions of the donor are less than philanthropic. There is no money that is inherently bad, but each nonprofit needs to decide for itself what qualifies as tainted money relative to its mission.

The final area is **investment policies**. Advocates of socially responsible investing argue that nonprofit organizations should ensure that their financial portfolio is consistent with their values. This ranges from investing in ventures that further an organization's mission to divestment from companies whose activities undermine that mission. Nonprofits commonly lack the budget to bring in an outside auditor to review their funds on a regular basis, which creates a lack of oversight to catch financial fraud and abuse of funds. When the board or in-house accounting department is in charge of auditing the books with no outside assistance, it is easy to overlook or fraudulently change numbers to support the ongoing negligence or outright theft of public funds. Of course many organizations are not in the position of having an investment portfolio! Regardless, the point is that all decisions made by a nonprofit organization should be tested against the mission and the organization's set of values.

## Perspectives and Solutions

Increasingly, there has been a trend to turn nonprofit management into a recognized profession with credentialing available for fundraising executives, association managers, and nonprofit organization managers. This is because nonprofits generate much of their revenue through nonmarket mechanisms such as seeking donations and many of the ethics-related principles that differentiate nonprofit organizations from their government and private sector counterparts focus on having and complying with a code of ethics. The first code was developed by the National Charities Information Bureau (NCIB) in 1992, and the second was developed by the Council of Better Business Bureau's Standards for Charitable Solicitations in 1974. Both focused on fundraising, set standards, and were not enforceable by law but served as a guide to both donors and those who run charities. Those standards were grouped in nine areas:

1. Board governance
2. Purpose
3. Programs
4. Information
5. Financial support and related activities
6. Use of funds
7. Annual reporting
8. Accountability
9. Budget

In 2001, NCIB merged with the Foundation of the Better Business Bureau and its Philanthropic Advisory Service (PAS). In 2007, it was rebranded into a "Start With Charity" campaign. Charities that meet its 20 standards are now referred to as "BBB Accredited Charities," and its ethics code can be found at http://www.bbb.org/us/charity. Among the controversial aspects of their code is the provision that calls on charities to allocate at least 65% of their donations for program expenses, spending no more than 35% of the related contributions on fundraising. This is a higher standard that either the NCIB or the BBB Philanthropic Advisory Service had enforced prior to the merger. Other standards in this code provide for regular assessment of the CEO's performance, establishment of a conflict-of-interest policy, completion of a written assessment of the charity's performance at least every 2 years, and

standards protecting donor privacy. The new standard discourages accumulating unrestricted net assets available for use that exceed either three times the amount of the past year's expenses or three times the current budget, whichever is higher. In 2016, when the Wise Giving Alliance celebrated 15 years of success, its president, Art Taylor, indicated that some issues continue to exist when verifying charity trustworthiness. Those issues include: (1) Bad Actors Won't Disappear – In a recent settlement with the Federal Trade Commission, all 50 states and the District of Columbia were involved in dissolving two cancer charities accused of fraudulent behavior. (2) Transparency Will Grow in Importance – There has been continued growth in the availability of charity information as the IRS Form 990 has become more accessible and charities will be prompted to be even more transparent about their activities, goals, results, impact, and achievements. (3) Information Manipulation – As charity financial information has become more accessible, it has become more challenging to identify the accuracy and consistency of shared data because some nonprofits follow generally accepted accounting principles (GAAP) in summarizing financial data and others don't. Increasingly, data differences will extend to other areas and confuse users seeking to make informed giving decisions (Rhode and Pakel 2009).

The national professional association of fundraisers also has a code of ethics which was first adopted in 1991 when the organization was known as the National Society of Fundraising Executives (NSFRE), and then in 2007, the code was amended and expanded to include 25 principles by the new organization, the Association of Fundraising Professionals (AFP). The new code consists of a set of general ethical principles, introduced by a preamble that recognizes the stewardship of fundraisers and the rights of donors to have their funds used for the intent they expect. One year after adoption, Standards of Professional Practice was incorporated into the code (https://www.afpnet.org). The code notes that violations "may subject the member to disciplinary sanctions, including expulsion, as provided by the AFP Ethics Enforcement Procedures." Some of the standards are perfunctory (e.g., members shall comply with all applicable local, state, provincial, federal, civil, and criminal laws), and others are general and broad (e.g., members shall not exploit any relationship with a donor, prospect, volunteer, or employee to the benefit of the member of the member's organization). Another issue raised in the standards that is currently of interest is that "members shall not accept compensation that is based on the percentage of charitable donations." While some states have expressly prohibited lobbyists from signing contingency fee contracts in which they are paid only when they are successful in getting a bill or amendment passed by the legislature, contingency fees are routine for attorneys in civil cases and it is not unusual for professional fundraisers to be paid a percentage of the amount that they raise. While many in nonprofits find that this practice promotes unethical solicitations and the AFP opposes compensation based on the amount a fundraiser raises, many feel that there is nothing inherently unethical about basing compensation on "performance."

Such standards and codes of ethics are important in addressing ethical issues in nonprofits; however, they are difficult to enforce. Another approach that is more effective is to rate nonprofits based upon criteria used in the codes and to make the information widely available on websites like guidestar.org, give.org, charitywatch.org, and givewell.org. By doing so, these organizations make the nonprofits more accountable for their actions and to their donors. Guidestar.org, as an example, rates nonprofits by total income, amount of public support, percentage spent on programs, and salary for the highest paid employee which is usually the CEO. Give.org rates nonprofits by board oversight, board size, frequency of board meetings, board compensation, conflict-of-interest enforcement, effectiveness policy, expense breakdown, audit reports, website disclosure, and treatment of complaints. Both of these organizations list as their top picks in 2015 – Goodwill, Catholic Charities, United Way, Red Cross, Salvation Army, and Habitat for Humanity and Boys & Girls Clubs of America. Charitywatch.org, as an example, rates nonprofits

positively if they spend 75% or more on program delivery, have government funding, spend $25 or less to raise $100, and enforce financial management. Charitywatch.org rates the Red Cross A – on their list due to, in part, their spending 90% of revenue on programs.

Another effective approach to resolving ethical issues is for the chief executive officer of the nonprofit to set the moral tone for the organization (Taylor 2016). CEOs are the ones that make their ethical priorities evident in multiple ways, including through policy, the criteria for hiring, promotion, and compensation and the fairness and respect with which they treat their employees. Of course, people vary in their capacity for moral judgment – in their ability to recognize and analyze moral issues, in their capacity for moral behavior and in the priority that they place on moral values. People care deeply about "organizational justice" and perform better when they believe that their workplace is treating them with dignity and is rewarding ethical conduct. What can CEOs do to create an ethical culture? Although there are no guarantees, CEOs can take several steps to create a strong ethical organizational culture:

1. Become a visible role model. Employees take their cues about appropriate behavior from those at the top.
2. Communicate ethical expectations. Organizations can create a "code of ethics." It should state the organization's primary values and the ethical rules that employees are expected to follow. If widely accepted and enforced, codes can also reinforce core values, deter misconduct, promote trust, and reduce the organization's risks of conflicting interests and legal liability.
3. Promote effective financial management. Use resources in a socially responsible way and strive to be cost-effective without sacrificing long-term institutional capacity. Ensure that the organization is using generally accepted accounting practices and is transparent with donors and grantors regarding the use of money.
4. Provide ethical training for employees, and use these training sessions to reinforce the organization's standards of conduct, to clarify what practices are and are not permissible, and to address possible ethical dilemmas.
5. Institutionalize an ethical culture by measuring employee performance and organizational performance against the code of ethics, and make sure the organization pays as much attention to what employees are doing as it does to final deliverables.
6. Provide protective mechanisms. The organization needs to provide formal mechanisms so that employees can discuss ethical dilemmas and report unethical behavior without fear of reprimand. This might include creation of an ethical officer, counselor, or ombudsman position in the organization whose job is to address and resolve those dilemmas effectively.

## Conclusion

A truly ethical organization requires staff involvement and a commitment to put in place policies and procedures that institutionalize ethical expectations and practice. Having a code of ethics is a good place to start. Training the executive director, top managers, and the board of directors so that they better understand how the code reinforces organizational values and what the language in the code means as well as discussing hypothetical and actual situations that others have faced sets the stage for actual ethical behavior to occur. A truly ethical nonprofit can only exist when its leaders embrace ethical decision making and recognize the importance of values other than the bottom line. Nonprofits are guided by a number of principles: first and foremost – *no one individual is to profit from the organization* (VanBuren 2015). Losing sight of this as a principle has led to many scandals. It is also important for the nonprofit to make sure that the principles of honesty, transparency, managing conflicts of interest, privacy, fundraising issues, and treating employees, volunteers, and clients with respect are operational (Svara 2007).

Honesty: Being honest and transparent is important to a nonprofit, and when not followed, it most quickly damages the organization's reputation. In theory, honesty is easy and in practice it is difficult. As an example, is it honest to present a rosy picture on a grant application when the organization does have problems? Being scrupulously honest can lose the organization's some much-needed funding, but being less than honest can be even more costly in the long run. All nonprofits need to consider the truthfulness of their statements, avoid exaggerations and statements that are not true, and recognize that omitting a statement can be the same as telling a lie.

Transparency: Nonprofits can only maintain the public trust by being open about their operations. By law, they must make their Form 990 available to the public, but they can and should do more to let the public know about their organization. Their website and fundraising appeals should clearly articulate the nonprofit's mission, values, scope of activities, and uses of revenue. They should release audited financial statements and an annual report as well as providing information about their goals and accomplishments to rating websites and to guidestar.org. Reports to the public and to rating agencies by the nonprofit's CEO or executive director should be scrupulously honest, consistent, and accurate.

Conflicts of Interest: The first step in addressing a conflict of interest is for the organization to recognize that it exists. As an example, board members are often chosen because of their professional abilities to provide a service to the nonprofit. Those same board members are also likely to be involved with several boards in the same community. Volunteers, employees, and even clients can also face conflicts of interest. In some states, like New York, it is illegal for nonprofit officers and directors to accept loans from the nonprofit. In other situations, the conflict is not directly addressed such as when a board member provides a service for less cost than the nonprofit could obtain otherwise. Some argue that it is important to keep the interests separate in all instances, while others say that it is acceptable to provide such services, so long as the conflict is fully disclosed and the conflicted person does not vote on where he or she should provide such services. At the very least, situations like this call for full disclosure and a disinterested vote.

Privacy: Nonprofit medical organizations and libraries protect patient and patron information. Many nonprofits rent or sell their donor lists without asking the contributor's permission even as codes of ethics increasingly forbid doing so without at least giving the donor the ability to remove themselves from the list. All nonprofits should consider protecting client and customer privacy even when their use of services is less sensitive because sharing donor information without at least giving the donor the ability to remove his or her information from the list raises ethical questions. The Internet adds another layer to the discussion because as the donor addresses credit card numbers and other personal information are provided to potentially unscrupulous people, the organization's code of ethics is clearly violated.

Fundraising: Nonprofits need to address whether it is ever ethical to pay a fundraiser a percentage of the money he or she raises. The Association of Fundraising Professionals (AFP) forbids this practice among its members because they believe that donors who contribute to a nonprofit deserve to see those funds go directly to the organization. Complaints about this practice make up the largest number of complaints that the AFP handles each year (Schmidt 2004). There are also other concerns in this regard. Not only should fundraising materials and solicitations be honest but the nonprofit should use the funds for the purpose specified before the donation was made. This can sometimes be difficult to do because situations change but the donor should, if at all possible, agree to the change. Sometimes, donors make unreasonable demands on the nonprofit such as asking for benefits to not be provided to other donors or for funding to be focused on a purpose not aligned with the nonprofit's mission or to forgo funding from a different source. Questions like these should be considered by the

nonprofit before they actually arise as part of the organization's overall awareness and should be addressed through the practice of their code of ethics and principles of ethical decision making.

Treating Employees, Volunteers, and Clients with Respect

To have an ethically functioning organization, employees and volunteers and clients need to be treated with respect and never discriminated against or harassed. When treated with respect, employees, volunteers, and clients will be motivated to respect the nonprofit and to raise questions when an ethical issue raises its head. Employees and volunteers should also be committed to the organization's code of ethics and to concentrate on its mission and its purpose and to being honest about what is right and what is wrong and how to complete the good works that the nonprofit has been set up to do.

# Ethical Issues in Regulating Reproductive Technologies

Bonnie Stabile
Schar School of Policy and Government, George Mason University, Arlington, VA, USA

## Synonyms

Assisted reproduction; In vitro fertilization

## Introduction

Reproductive technologies available in the early twenty-first century include a complex array of tools and procedures that enable many people to have children who would otherwise have been unable to reproduce just a little over a generation ago. An expansive definition of reproductive technology might also include capabilities that enable the creation or selection of the traits of children resulting from its use, or even the ability to avoid having children altogether. As with all new technologies, no matter how beneficial, their application can raise ethical questions not previously encountered and precipitate calls for regulation or policy interventions. Bioethics, the "study of moral issues in the fields of medical treatment and research" (Caplan and McGee 2016), can be usefully applied in examining the issues that arise in regard to reproductive technologies. The field of bioethics can be seen as comprising two broad, yet "distinct sub-categories: 1) safety and efficacy, which might also be called 'basic bioethics', and 2) social values, which includes more complex and wide-ranging philosophical, moral and legal considerations" (Stabile 2006, p. 14). These categories cover the predominant ethical considerations brought to the fore when regulation of reproductive technologies is raised.

Though reproductive technologies include some relatively low-tech procedures, such as artificial insemination, the heyday of high-tech assisted reproduction can be traced to the advent of in vitro fertilization (IVF), which was first

accomplished in England in 1978, and in the United States (USA) in 1981 (Sullivan 1981). IVF involves taking eggs from a woman's ovaries and fertilizing them with sperm in a petri dish. The resulting embryos are transferred to a woman's uterus, where it is hoped at least one will implant, leading to the successful birth of a baby (Kincaid 2015a). According to the CDC, the procedure results in a live birth about 30% of the time and accounts for 1.5% of babies born in the USA (Kincaid 2015a).

While originally conceived of as a means of overcoming a common form of infertility, in which a woman's fallopian tubes are unable to transport a mature egg cell from the ovaries to the uterus for fertilization to occur naturally, IVF has made possible a spate of ethically contentious capabilities. These include the use of donor gametes – egg, sperm, or both – for implantation in an intended mother; the use of a surrogate mother to carry a baby to term for other intended parents; and the selection or manipulation of embryos before implantation, to screen for particular traits. This chapter will examine assisted reproductive technologies (ARTs) and practices including IVF, surrogacy, egg donation, pre-implantation genetic diagnosis and gene manipulation, and the principle ethical issues regarding their regulation.

## In Vitro Fertilization

The safety of IVF does not seem to have been seriously in question in the public mind since before the birth of Louise Brown, the world's first "test tube" baby, who entered the world as a healthy baby girl, and not the monster some had feared before the procedure was tested and proven (Marantz Henig 2010). And though some, such as the Catholic Church, find IVF morally problematic due to its manipulation of human embryos, it has gained mainstream acceptance and resulted in the birth of more than five million babies worldwide in the first 35 years of its use (Rochman 2013). The USA, in particular, has regulated IVF only lightly, leading to its characterization as the "Wild West of the fertility industry" (Ollove 2015). The *Fertility Clinic Success Rate and Certification Act of 1992* requires the reporting of some statistics to the Centers for Disease Control and Prevention (CDC), making them available to the public, but the industry is governed primarily through self-regulation (Kincaid 2015b).

One concern is that the number of embryos implanted per IVF cycle evidently exceeds the limits recommended by the American Society for Reproductive Medicine to its physician members, as the number of multiple births has soared, with the rate of twin births alone climbing by 70% since 1980 (Tarkan 2008). Multiple pregnancies are associated with a higher incidence of premature births, which are costlier and lead to more adverse health complications than singles. Nonetheless, market demand for IVF has not abated, as individuals desperate for children of their own seem to willingly take on the considerable costs, about $12,000 per cycle, of the procedure and the increased risks it entails.

According to the principles of biomedical ethics outlined by Beauchamp and Childress (2013), individuals ought to have the right to make choices about what therapies they avail themselves of (autonomy), assuming that the medical community has fulfilled its obligation to ensure that its practices "do no harm" (nonmaleficence), and patients are fully informed of any reasonable risks. Society, according to these principles, ought to "take positive steps to help others" (beneficence) (Beauchamp and Childress 2013, p. 202) and to ensure fair and equitable treatment of all citizens (justice).

To the extent that IVF is a beneficial therapy that allows tens of thousands of infertile people to have children annually (65,000 in the US in 2012 alone) (Ollove 2015) and thereby fulfill what many consider to be an integral aspect of human flourishing, the principles of beneficence and justice suggest that government might take a role in enabling citizens to have broader access to this benefit. Fifteen states in the USA have adopted laws that require insurance providers to cover either infertility diagnosis or treatment. A dozen of these cover IVF, the most expensive infertility treatment, along with less costly procedures like insemination and hormone therapy. These

infertility insurance mandates reflect social values in the states of their passage in the form of a number of restrictions. Six states have exemptions from providing coverage for religious employers, four require that those receiving benefits be married, and three require some version of Hawaii's code, which stipulates that "the patient's oocytes" must be "fertilized with the patient's spouse's sperm" (Stabile 2010). Despite these restrictions, such policies demonstrate that regulation can serve to expand access to desired benefits.

## Surrogacy

The practice of gestational surrogacy is made possible by IVF technology, which enables a woman to bear a child to whom she has no genetic relationship through the creation of embryos outside of the womb. Regulations regarding surrogacy seem less concerned with its safety and efficacy than with its social values implications. While surrogacy has achieved a degree of acceptance in the USA and produced some 2000 babies in 2014 alone, there is no national consensus or federal law guiding its use (Lewin 2014). Seventeen states expressly permit the practice, 21 states have no laws or court decisions to guide it, and five states consider all surrogacy contracts to be "void and unenforceable" (Lewin 2014). The USA is one of the few developed countries where paid surrogacy is legal at all, as it is prohibited in Canada and most of Europe (Goldbert 2016).

Where surrogacy is permitted, the principle of autonomy is upheld, as both the surrogate and the intended parents are able to exercise "procreative liberty," defined as "the freedom to decide whether or not to have offspring and to control the use of one's reproductive capacity" (Robertson 1994, p. 16). Opponents, however, argue that true autonomy is not possible in the case of surrogacy, since they doubt that "a woman's agreement to have a baby and give it up for money" could be fully informed and fear that her initial consent might be unduly influenced by the need for money (Sandel 2009, p. 92). Though many women claim to be motivated primarily by altruistic intent in carrying a child for another individual or couple, the economic incentive is another undeniable component of most such arrangements. This is evident in the USA, where some 20% of surrogate babies are born of military wives, who can earn between $30,000 and $50,000 for carrying a baby, which is well above the average enlisted soldier's annual salary (Howard 2015). The potential for undue economic inducement is even more evident in transnational surrogacy arrangements, where, in countries such as India, which has an extensive surrogacy industry, many women describe surrogacy as their only option for making a living (Bengali 2016). Reliance upon relative disadvantage to instrumentalize the reproductive capacity of some for the benefit of others can be seen as ethically problematic as a matter of justice.

Dorothy Roberts has noted that "procreation's special status stems as much from its role in social structure and political relations as from its meaning to individuals" (quoted in Darnovsky 2010, p. 111) which implies that ethical and legal matters arising from surrogacy have implications beyond individual liberty and autonomy. In *The Moral Limits of Markets*, Michael Sandel says that "sometimes market values create nonmarket norms worth caring about" (2013, p. 113), suggesting that the commodification of reproduction and its precious products may corrupt their value and meaning in society. Similarly, some worry that practices such as surrogacy and egg donation might perpetuate valuing women as mere bodies, breeders, or baby machines (Satz 2011).

## Egg Donation

The medical literature suggests that egg donation, which involves ovarian stimulation and oocyte retrieval, is no more risky than standard IVF, carrying a less than one percent chance of serious complications, like ovarian hyperstimulation syndrome, abdominal bleeding, and infection (Woodriff et al. 2014). Yet, because those donating eggs do not directly benefit from the procedure, the process for informed consent ought to be

held to a higher standard than for patients undergoing egg retrieval for their own IVF procedures, thus benefiting themselves (Skillern et al. 2014). Ethical obligations to protect vulnerable populations are especially important, and it is debated to what extent young women of college age – those most often targeted for egg donation – are, in fact, vulnerable. Egg donation is legal in the USA and regulated only to the extent that the Food and Drug Administration (FDA) requires donors to be tested for some sexually transmitted infections and HIV and that stored eggs, sperm, and embryos be labeled (Kincaid 2015b). The American Society for Reproductive Medicine's guidelines stating that fees over $10,000 are "inappropriate" could be seen as a way to limit undue inducement, but are often not heeded by practitioners, and have been challenged in court as a form of price fixing (Lewin 2015). Egg donation, though the phrase implies a freely given gift, most often involves the payment of a fee to the "donor." This is ethically problematic for some, like Sandel, who are concerned with the consequences of commodifying human reproduction and others who might see it as akin to selling body parts.

Paternalistic policies, which limit some freedoms for the purpose of protecting individuals or populations who might otherwise be harmed, are sometimes sought to rein in egg donation and IVF. Since known short-term risks to health and safety are limited in both cases, arguments for more regulation may rest on concern with social values, or unknown long-term consequences. Some religious and social conservatives object to the use of assisted reproductive technologies (ARTs) in part because they enable reproduction that subverts traditional paradigms, allowing homosexuals or single women to found families. Others assert that, though current scientific evidence is unable to substantiate the existence of harms resulting from IVF or egg donation, adherence to the precautionary principle is warranted to prevent future harms, of which we might not yet be aware due to the fact that ARTs have only been in use for 30 years or so. This latter principle is more widely embraced in Europe, where it serves as the basis for regulation of genetically modified organisms in the food supply and likely underpins restrictions on ARTs as well.

## Pre-implantation Genetic Diagnosis and Gene Editing

The manipulation of embryos involved in IVF not only enables some otherwise infertile individuals to have their own biological children; it also makes it possible to screen those embryos for favored traits, such as freedom from genetic diseases, or a preferred gender, and potentially other attributes. Pre-implantation genetic diagnosis (PGD) tests IVF embryos for the presence of genetic or chromosomal abnormalities so that families with these inheritable conditions can avoid passing them on by selecting to implant only embryos free of these conditions. In the UK, the Human Fertilisation and Embryology Authority (HFEA) deliberates over the disposition of all embryos and publishes a long list of conditions for which it is allowable to use PGD, such as cystic fibrosis and Down's syndrome. In the USA, there is no such regulatory entity overseeing fertility clinics and embryo research, so PGD can be used even for sex selection, which is prohibited in the UK.

Avoiding inheritable disease is generally agreed to be a morally defensible use of reproductive technology, but some, like Marcy of the Center for Genetics and Society, fear that selecting embryos on the basis of their genetic traits is a form of "high-tech eugenics" (Sidhu 2012). Groups representing people with disabilities worry that if conditions such as deafness or Down's syndrome become less common, the people who have them will be even further marginalized. And Darnovsky asserts that choosing embryos on the basis of sex encourages gender stereotyping that is potentially damaging to women and girls (Sidhu 2012). Sex selection has been demonstrated to have damaging effects when practiced widely in populations, such as India and China, which now face seriously skewed sex ratios, millions of unmarriageable men and a spike in trafficking of women (Hvistendahl 2011). Sex selection using PGD

occurs in wealthier populations such as the USA, where it sought to achieve "family balance," often by those seeking girls (Sidhu 2012). In the developing world, where boys are favored for their status and breadwinning capacity, cheaper, lower-tech options for sex selection are favored, like ultrasound, followed by abortion if a female fetus is detected.

Fears about PGD's potential for use in the creation of "designer babies" have been largely unfounded, as the current state of reproductive technology does not allow for the selection of embryos based on desired traits like height or musical or athletic ability. Nonetheless, similar concerns have been raised about gene editing since the HFEA decided to allow the gene editing technology known as CRISPR/Cas9 in embryo research in February 2016. The stated intent of the research is to study early-stage human development, but the capability of CRISPR/Cas9 is that of a scalpel-like tool that has been used to cut out gene mutations leading to conditions such as HIV. Should the hopes of some and the fears of others be realized, this technology could eventually lead to the editing of embryos to eliminate certain conditions and traits deemed undesirable not only in individuals, but in the germ line, with unknown unintended consequences for future generations.

## Conclusion

Reproductive technologies have led to millions of births, easing the heartache of many who might otherwise have suffered from infertility, or the burden of passing on devastating diseases. Once determined to have low risk of harm and significant potential for relieving human suffering, it seems appropriate to permit, and even promote, as a matter of beneficence, such medical therapies and practices as IVF, surrogacy, egg donation, and pre-implantation genetic diagnosis. Yet each of these ARTs raises ethical challenges that arguably warrant some kind of regulation. Those undergoing IVF, and acting as surrogates and egg donors, must be fully informed of the known risks and consequences of their participation in order to be able to make truly autonomous decisions. And though care should be taken to ensure procreative liberty, account should be taken, too, of the long-term and society-wide consequences of the use of reproductive technologies. If such beneficial technologies are available only to the well-off and are made possible by the service of donors or surrogates compelled by economic need, already prevalent injustices might be perpetuated. This division could be exacerbated with the further development of genetic engineering.

Health risks of current practice, to women, and to children born as a result of reproductive technologies, merit ongoing attention. Self-regulation guidelines have often gone unheeded, leading to a discernable increase in multiple pregnancies and premature births. The medical community and governmental authorities have a duty to protect public health and avoid harms as a matter of nonmaleficence. Paternalistic policies justifiably protect the rights of children to know their genetic origins when donors or surrogates are involved. And precautionary policies may be appropriate to temper the advance of reproductive technologies that may pose consequential risks to humanity.

## Definition

| | |
|---|---|
| Ethics | Ethics is a set of standards, a code, or value system, worked out from human reason and experience, by which free human actions are determined as ultimately right or wrong, good, or evil. If acting agrees with these standards, it is ethical, otherwise unethical. |
| Research | Scientific research refers to a persistent exercise towards producing new knowledge to unveil a new stream of ideas in academia for humankind. |
| Research Ethics | Research ethics refer to some of the genres that researchers follow to protect the rights in developing research strategies and building a trusted relationship between the study participants and investigator. |

## Introduction

Ethics or moral philosophy is a branch of philosophy with standards or codes or value systems and involves defending, systematizing, recommending concepts of right, and minimizing wrong conduct. Ethical issues in research are some of the genres that researchers follow to protect the rights in developing research strategies and building a trusted relationship between the study participants and investigator. In a scientific study, research ethics plays a crucial role, and it refers to a persistent experience towards producing new knowledge for the sake of unveiling a new stream of ideas in academia. Ethical considerations in research have always been challenging, including ethical concerns vis-a-vis time, funding, accessibility, and proper implementation of these concerns. These considerations need to apply throughout the study rather than at any specific time of the process. The current chapter will briefly cover basic research ethics principles and their implementation in research strategies.

## Basic Principles of Research Ethics

**Research ethics** guide researchers conducting any research, educate, and monitor scientists to ensure a high ethical standard in research. Major ethical requirements of scientific study include five fundamental ethical principles, which needs to be considered at the research planning and designing phases: first, minimizing the risk of harm to the participants; second, securing informed consent from the identified research participants; third, protecting the anonymity and confidentiality of the participants; fourth, avoiding deceptive practices; and finally, offering participants the right to withdraw from the research at will (Principles of research ethics; Homan 1991; Israel and Hay 2006; Kimmel 1988).

Two major concepts are in consideration here: (a) the researcher should focus on the participants' welfare as a goal of any research study, which is known as *beneficence*, and (b) the researcher must avoid harming and maintain confidentiality, which is known as non-malfeasance (Principles of research ethics). Based on country or institution, ethical requirements in research may differ. While reviewing the approval process, the ethics committee of the concerned institution might find inadequacy of ethical requirements in the proposal and may reject any study that fails to meet the basic ethical standards.

## Minimizing the Risk of Harm

No research is supposed to do any harm to participants. Even then, participants could be subjected to several types of harm, such as physical harm, psychological distress, social humiliation, financial loss, and invasion into privacy by breaking the anonymity rule. Strong justifications are crucial if there are any possibilities that participants could be harmed or feel discomfort. Additional strategies and planning mentioning the harm or discomfort reduction strategy, including detailed debriefing, may contain the situation. Therefore, it is important to minimize the risk of harm by

ensuring, inter alia, informed consent, protection of anonymity and confidentiality, and nonuse of any deceptive practices, including options for participants to withdraw from the research at any time (Principles of research ethics; Homan 1991; Israel and Hay 2006; Kimmel 1988; Fisher and Anushko 2008).

## Obtaining Informed Consent

"Informed consent" is known as the cornerstone of ethical research. The informed consent process is also known as a contract between the researcher and the participants. The term consists of two important elements, and each requires careful consideration: "informed" and "consent." The required information in the consent form should include the purpose of the research, what will be asked to them, the methods being used, how the data will be used, the possible outcomes of the research, and associated inconveniences and risks/consequences (if any) that the participants might face. The participants must provide explicit, signed consent to participate in the research, including understanding their rights to access their information and the right to withdraw anytime at will. It is also a standard practice to mention in the consent form that the participant is volunteering and his/her participation in the study is without being coerced and deceived. There are situations where informed consent may not be possible to collect from participants; in that situation, the researcher must thoroughly explain the case before approaching the actual research activity with the participant(s) and ethics committee (Principles of research ethics; Homan 1991; Israel and Hay 2006; Kimmel 1988; Fisher and Anushko 2008).

## Protecting Anonymity and Confidentiality

If the participants are willing to volunteer to share private or sensitive information, the researchers must ensure extra efforts to keep the information confidential. Insensitive data collection methods might hurt the research participants' privacy. It is likely to face a greater risk of data breach after collection if data is not stored and treated sensibly, including even during the publication process. However, some research may not be mandatory to keep the information of the research participants confidential or anonymous. If the investigator needs to disclose confidential information of the research participants, an entirely understandable "informed consent" has to be taken from the participants (Principles of research ethics; Homan 1991; Israel and Hay 2006; Kimmel 1988; Fisher and Anushko 2008).

## Avoiding Deceptive Practices

The deception of subjects may occasionally be a requirement in research studies, known as covert research. This is typically needed to promote scientific validity, where subjects are given false or incomplete information about the research to obtain unbiased data with respect to their attitudes and behavior. This is generally used when complete or truthful disclosure is expected to produce biased results. For example, the research study team may inform subjects that they will be engaged in a cooperative task with other subjects, but in reality, subjects will be interacting with study personnel, of course unknowingly (Principles of research ethics; Homan 1991; Israel and Hay 2006; Kimmel 1988; Fisher and Anushko 2008). Few things must be remembered in such a situation:

- The potential scientific value to the research should justify deception, not otherwise.
- Deception should only be used when there are no reasonably effective, alternative methods available to achieve the research study's goals.
- Deception is only used with study components having potential risks.
- In the interest of full disclosure, researchers must debrief subjects about the deception to the extent possible.

## Providing the Right to Withdraw

Most ethics committees for research, which review research protocols, generally emphasize reserve unconditional or absolute "right" of withdrawal of participants at any time and without giving any reason. The right to withdraw, by design, is to protect research participants from an inherent uncertainty, information imbalance, inability to hedge, and untoward bodily invasion. This is important because it strengthens public trust in the research institution and the research domain. Research participants must have the right to withdraw anytime at will from the research process, except for covert observations. The research team must ensure that when a participant considers withdrawing from the research process, there should not be any way to stop them from withdrawing (Principles of research ethics; Homan 1991; Israel and Hay 2006; Kimmel 1988; Fisher and Anushko 2008).

## Brief Historical Background of Research Ethics

Individuals, communities, and social values govern scientific research work as human activities. Research ethics involve protecting subjects' dignity required in daily works and the publication of the information in research. Ethical concerns and dilemmas are part of the everyday practice of conducting all types of research. Ethical issues are not confined to qualitative research or studies involving human subjects and equally pertinent in clinical trials that involve animals. Moreover, ethical issues are also equally important for non-empirical research that has remarkable direct and indirect impacts and research investigating humans or documents related to people. The traditional starting point and focus for ethical issues were mainly in quantitative biomedical research. However, social scientists have started discussing ethical issues in qualitative social research since 1960s (Homan 1991; Bulmer 1982; Robley 1995).

Experiment on humans was conducted even before the eighteenth century. However, ethical issues in research drawn society's interest only after the 1940s because of human exploitation in several research. Thus, professional codes and laws were introduced to prevent abuses of human lives in the name of research. The Nazi experiments led to the Nuremberg Code (1947), which is the leading code for all subsequent codes to protect human rights in research. Voluntary informed consent, liberty of withdrawal from research, protection from physical and mental harm, or suffering and death were the main focus of this code. This code also emphasizes the balance between risk and benefit of involving humans in research. This code's key limitation was the self-regulation of the research that could be abused. All declarations followed prohibited nontherapeutic research, but Helsinki's declaration in 1964 urges the necessity of nontherapeutic research. Helsinki's declaration emphasized the protection of human subjects and strongly proclaimed that individuals' wellbeing should be prioritized over scientific and social interests (Homan 1991; Kimmel 1988; Orb et al. 2001).

## Research Strategy and Research Ethics

It is important to understand how research strategy affects research ethics. Any research strategy introduces a research study or project's main components, such as research perspective, research area, focus, research method, and research design, including sampling and data analysis techniques. It means how researchers propose answering their research questions and implementing the methodological aspects. All these components have inherent ethical implications for the research study. Therefore, when a research strategy is undertaken, it is supposed to guide the study and determine the research approach, leading to research ethics (Homan 1991).

## Ethical Issues in Research Designs

Each type of research design comes with unique ethical challenges. There are three types of

research designs: quantitative, qualitative, and mixed-method designs.

### Quantitative Research Design

Quantitative research design is more structured and well-defined, allowing researchers to plan most of the research process in clear terms ahead of time. There tends to be relatively little deviation from these design specifics even during the research implementation phase. Clarification about the quantitative design and associated process makes it easier to understand potential ethical challenges during the research phase. Accordingly, the researchers can plan to address these possible ethical challenges, including an appropriate ethics proposal (Kimmel 1988).

In nonexperimental research, the researcher only needs to convince the supervisor that potential ethical challenges were covered instead of submitting an ethics proposal to an ethics committee. In experimental research, especially involving human subjects, the researcher needs to submit an appropriate ethics proposal, although that process can slow down the research process (Hill and Wright 2001).

### Qualitative Research Design

The primary way of conducting qualitative research is to use structured, semi-structured, and unstructured interviews. Researchers can get rich and in-depth information using interview techniques. However, extensive planning to develop the structure; decide whom to interview and how, individual or group interviews; and record and analysis is mandatory. Interviewees should have multiple skill sets of conducting qualitative interviews, including rapport building, social skills, communication, and good listening skills. All these are prone to problems of uncertainty associated with individual behavior, thereby generating possible biases, leading to ethical challenges (Robley 1995; Orb et al. 2001; Wiles et al. 2006).

A research project may have several stages. Qualitative research design and data obtained during implementation may affect selecting research methods in the following phase(s) of a research project. Therefore, potential ethical issues, therefore, may arise in the next stage of a research project only become apparent after completing a certain preceding stage(s). This raises difficulty in understanding possible ethical challenges that may evolve in the process of qualitative research. Furthermore, subsequent planning should be at the outset of the research process to write an ethical proposal and overcome these ethical challenges. The ethical approval process may even get more complicated if the research involves deceptive practices (like covert observation) or sensitive segments of human subjects like children or marginalized people. Thus, the inclusion of a qualitative component, with its uncertainty, makes the ethics approval process more challenging (Robley 1995; Orb et al. 2001).

### Mixed-Method Research Design

Researchers should consider the potential ethical challenges inherent in quantitative and qualitative research, including possible synergy to apply mixed-methods research design. Often, this forces a greater burden on the researcher to clarify the overall design process and slow down the research process. This is particularly prominent if the researcher needs to finish the qualitative phase (e.g., interviews) before settling on the appropriate quantitative technique (e.g., experimental or nonexperimental) (Fisher and Anushko 2008).

## Ethical Issues in Research Methods

Potential ethical issues may be raised from research methods (e.g., surveys, in-depth interviews) to be used. The ethical issues may also be different due to how a method is used (e.g., covert versus overt observation).

### Surveys and Structured Interviews

Surveys and structured interviews usually employ closed-ended questions, and respondents choose answers from the predefined options, which should be designed before starting research. Thus, it becomes easier for respondents to understand predefined questionnaires and for researchers to get informed consent. However, researchers should clearly explain the structured

questionnaires, options, ethical issues, and rights for the respondents, which help researchers get informed consent and ease the research participant's mind, minimizing potentials for distress (Israel and Hay 2006; Kimmel 1988).

### Observation: Overt and Covert

Compared to surveys and structured interviews, overt or covert observation methods warrant higher ethical scrutiny. In covert observation, participants do not know which research method is applied that can raise significant ethical concerns. It is reassuring to note that most research that uses observation as a research methodology generally tends to use an overt method, where the participants are aware that the researchers are making them subjects. It is relatively easier to obtain informed consent from those participants who undergo overt observations. On the other hand, covert observation is a form of deceptive practice and problematic in terms of ethical aspects. The participants' absence of informed consent and the researcher's willful attempt to keep the observation covert can give rise to ethical concerns. It could be considered contentious to use covert observation and deceptive practices, especially when used intentionally (Kimmel 1988; Bulmer 1982).

### Informal and In-Depth Interviews

Informal and in-depth interviews can lead to greater exposure to ethical standards. Potential ethical issues may arise from the types and quality of data that needs to be obtained, the procedure of storing the data, and how to inform the participants that their data will be used (Orb et al. 2001; Wiles et al. 2006).

## Ethical Issues in Sampling Strategies

Sampling that the researcher may choose to investigate can also raise several ethical issues that need a clear understanding and appropriate attention to be resolved.

### Sampling Techniques

During the sampling process, the researcher needs to decide on sampling units (e.g., people, organizations) – criteria to include as a sample and exclude from the included samples –sampling techniques (probabilistic and non-probabilistic) help in selecting such units. The researcher selects units for the sample from an existing population list with specific confidentiality and data protection issues in the probability sampling technique. Until the researcher gets permission to access the population list and its details, it is unethical to use it for research purposes. This warrants the researcher to obtain the right to have access to the list he/she intends to use. For non-probability sampling, the researcher may include or exclude units for theoretical or practical reasons. For example, in purposive sampling, the choice of units to be included and excluded is entirely driven by theoretical elements, raising few ethical concerns. On the other hand, if units are included or excluded for practical reasons like ease of access or personal preferences (e.g., convenience sampling), there exists the risk that some units may be excluded unnecessarily, which also raises ethical issues (Principles of research ethics; Butler 2002).

### Sample Size

Sample size depends on sampling techniques, whether probabilistic or non-probabilistic aspects of it. Ethical issues might appear in determining sample size for two reasons: (a) an oversized sample, more people or organizations in the sample than necessary to achieve the research goals, is an ethical issue because it would expose more people (or other units) than it is necessary for the study; and (b) an undersized sample limits the researcher to achieve the goals of the study, due to insufficient units of the sample. The ethical issue is that the researcher fails to correctly answer the research questions, not because of the lack of answer; instead, it is due to the small sample size for such an answer to be explored, derived, or interpreted (Principles of research ethics; Butler 2002).

## Ethical Issues in Data Analysis

The participants' confidentiality and data privacy issues often face challenges during the data

analysis and reporting phases. Ethical challenges are different for quantitative and qualitative data analysis, which requires particular attention. Quantitative data analysis techniques (e.g., data aggregation and data summarization) have built-in protection mechanisms towards respondents' anonymity with some exceptions (Hill and Wright 2001). On the other hand, both presentation style and the depth of qualitative data quality often create potential ethical challenges, mainly due to researchers' style of reporting qualitative data in all its richness, increasing the risks of identifying research participants (Wiles et al. 2006).

## Conclusion

Research ethics are important moral signposts for researchers to avoid deception when conducting and reporting research outcomes. Research ethics also protect against any possible harm to the study participants. This further helps validate any research. Following ethical standards in research also ensures credibility and public trust. Ethical issues in research should be prioritized in the study design phase. Therefore, tackling ethical issues and challenges aligns with the research strategy to get maximum impact.

# Ethical Leaders

Ranesh Sivnarain
Forensic Services, University of KwaZulu-Natal, Durban, South Africa

## Synonyms

Honorable; Leaders with integrity; Principled; Virtuous

## Definition

Ethical leaders conform to accepted standards of conduct.

## Introduction

The prevention of fraud has become an integral component of conducting business throughout the world. With the advent of evolving business practices, organizations conducting business across geographical and political borders, and the sophistication of computer technology, fraudsters have

adapted their *modi operandi* to perpetrate fraud in the twenty-first century. In order to prevent fraud, governments have enacted legislation, while leaders of organizations in general have implemented or amended fraud prevention policies and procedures. There is a thrust to inculcate an ethical ethos within organizations. This chapter elaborates on the relevance of ethical leaders within organizations.

## The Conduct of Unethical Leaders

Unethical conduct in the form of fraud and corruption is becoming ubiquitous. A poor ethical culture set by leaders is a catalyst for employees to commit fraud against their organizations. Therefore, organizations should advocate integrity and sound ethical values (COSO 2017). Management and the board of directors should set a sound ethical tone at the top (lead by example), design and implement a code of conduct, and monitor and measure compliance with this code during employee performance reviews.

The circumvention of internal controls by Management is a form of unethical conduct within an organization. Internal controls are circumvented by fraudsters to commit fraud. Circumvent is defined as "to get around something in a clever and sometimes dishonest way" (Merriam-Webster Dictionary 2017a). Organizations should take into consideration the risk of employees circumventing internal controls to commit fraud. They should design and implement fraud prevention controls by enhancing management oversight over operations.

Management also overrides internal controls in order to commit fraud. Strong internal controls can minimize risks that an organization is exposed to, but it cannot obviate risks linked to the overriding of internal controls. Override is "to stop an action that is done automatically by using a special command" (Merriam-Webster Dictionary 2017b). The override of internal controls by management could lead to the failure of the internal control environment (COSO 2017). Management, as the leader of an organization, is responsible for designing, implementing, and monitoring internal controls. Organizations are susceptible to the override of internal controls by management, who are tasked with preserving the internal control environment. In such a scenario, organizations should rely on an independent audit and risk committee to maintain oversight over the internal control environment to prevent the override of internal controls by management.

The trend of 62% of management and senior management committing fraud has not significantly changed over recent years (PwC 2014). Management has a fiduciary duty to protect public funds entrusted to them from fraud and abuse. In this regard, it is the responsibility of management to design and implement strong fraud prevention internal controls. The fraud prevention strategy of organizations should consider this risk by implementing strong mitigating internal controls and other relevant antifraud interventions.

## The Negative Impact of Unethical Leaders

The perpetration of employee fraud is pervasive despite the existence of internal controls which are intended to prevent fraud from taking place. Approximately, 58% of organizations globally, which were victims of fraud, were not able to recover any of the losses from the fraudster (ACFE 2016). With an escalation of the number of incidents of fraud and corruption, the cost of the loss to the victim organization can be expected to escalate. Organizations lose approximately 5% of their income to fraud every year (ACFE 2016). Of concern to organizations should be the phenomena that approximately 66% of employees who committed fraud held management and senior management positions (KPMG 2016). Losses due to employee fraud need to be prevented, as the cost of the loss is not limited to the amount that has been defrauded. The loss does not include the cost to have the matter investigated, disciplinary action, dismissal arbitration, civil litigation, and criminal prosecution.

## Internal Controls

A sound ethical culture, coupled with effective internal controls, is essential to prevent fraud that is committed by employees. The challenge for organizations is determining how to tighten their internal controls to prevent fraud from occurring and also detect and investigate fraud that has already occurred. A significant increase in cases where deficient internal controls were exploited by the fraudsters escalated in 2013 from 54% to 61% during 2016 (KPMG 2016). Internal controls are an essential intervention in preventing fraud, but may not be the only intervention required. It is the responsibility of management to adequately design and implement internal controls to mitigate fraud risks.

It is essential for organizations to espouse integrity and high ethical values. This principle is premised on four essential elements. Firstly, the board and all levels of management should set a sound ethical tone and lead by example. Secondly, standards of conduct serve as a reminder to employees and stakeholders to act ethically. Thirdly, adherence to the standards of conduct is evaluated during performance reviews. Lastly, deviations from the standards of conduct are identified and appropriately addressed.

The board should also exercise adequate oversight and exhibit its independence from management and ensure that internal controls are developed and remain effective and adequate. Leaders should be held accountable for their internal control responsibilities.

## Fraud Prevention Initiatives by Ethical Leaders

Ethical leaders set a strong ethical tone at the top, which their employees follow. This initiative is supported by the implementation of a code of conduct followed by awareness training for all employees about the tone at the top and the code of conduct. The code is the standard of ethical conduct expected of all employees. It is essential for organizations to create and implement a fraud prevention policy and response plan. The policy should stipulate preventative measures as well as the action that will be taken once fraud is detected or suspected. The policy should guide the process of evidence gathering to ensure admissibility in courts of law. The policy should emphasize the commitment of the organization to high standards of legal, moral, and ethical conduct as well as spell out the consequences for employees who do not adhere to these standards (CIMA 2008). An anti-fraud policy is essential for management, in which a strong ethical culture among all employees within the organization is highlighted.

In enhancing sound governance, the practice of whistleblowing has proved to be useful in detecting fraud. At least 47% of employee fraud had been detected globally by means of a tip-off (ACFE 2016). This result emphasizes the benefit to organizations in having a whistleblowing facility together with a relevant policy to address fraud. The Sarbanes-Oxley Act of 2002 in the United States of America (USA) compelled organizations to implement a whistleblowing program in order to receive and respond to reports about fraudulent activities. Subsequently, the Dodd-Frank Wall Street Reform and Consumer Protection Act of 2010 compelled the U.S. Securities and Exchange Commission (SEC) to reward whistleblowers for reporting transgressions of federal securities legislation in USA. According to the website of the U.S. SEC (2017), the Commission is authorized to provide "monetary awards to eligible individuals who come forward with high-quality original information that leads to a Commission enforcement action in which over $1 000 000 in sanctions is ordered. The range for awards is between 10% and 30% of the money collected."

Organizations need to inculcate a culture of ethical conduct among all its employees, from its leadership to the most junior employee. Employees should emulate their leadership and management and act ethically. Management should not adopt double standards and act unethically, yet expect their subordinates to behave otherwise (CIMA 2008). Continuous fraud awareness training should be provided to

employees to empower them to understand what fraud and unethical conduct is and how to report these when they encounter it. Employees who are trained to identify fraud schemes will be valuable in reporting fraud when they encounter it. Organizations should consider offering a cash incentive to employees for providing information about fraudulent activities. The cost of the reward payment could be justified by the decrease in fraudulent activities.

## Governance by Ethical Leaders

In order to ensure ethical leadership (and ultimately sound governance), emphasis should be placed on two aspects. These are board or audit committee oversight as well as senior management oversight. Firstly, directors of a board or members of a council occupy an essential role in overseeing the implementation of internal controls intended to mitigate fraud risks. In certain instances, such an oversight role is delegated to the audit committee by the board. Directors should ensure that internal controls are adequate and effective. Setting the tone for ethical behavior in an organization is the joint responsibility of the board and management. Secondly, senior management should be responsible for oversight of the fraud risk management interventions that are implemented. Their oversight should not be primarily on prevention, but detection and response to fraud should not be overlooked. The chief executive officer is best placed to set an appropriate ethical culture within the organization. S/he is able to lead by example and direct the effort with assistance of the senior management team. The chief executive officer should hold members of the senior management team accountable for noncompliance with policies and procedures. This message should permeate the organization and serve to consolidate an ethical culture within.

The code of conduct should apply to clients, suppliers, and stakeholders. Such a code sets a strong tone within the organization about the commitment of management to a sound ethical culture. In order for this tone from the top to permeate throughout the organization, it requires that employees are made aware of the code and the commitment of management to a culture of integrity. A code of conduct is essential to ensure that all employees commit to a single standard of high ethical culture within an organization, without any double standards and selective application.

One of the key principles of the King IV Report on Corporate Governance for South Africa (2016) is that the governing body should lead ethically and effectively. Firstly, this principle requires that the governing body display integrity, competence, fairness, accountability, responsibility, and transparency in all its dealings. Secondly, it should ensure that the organization achieves its objectives. Lastly, the governing body should disclose how they are being held to account for their leadership.

## Conclusion

The need for an effective ethical culture within an organization has been emphasized. In the quest to inculcate a sound ethical culture, it is essential for an organization to design, implement, and communicate a code of conduct based on ethics among all employees, clients, suppliers, and other stakeholders. The leadership of the organization should be responsible for setting the required standards for ethical behavior and leading by example. The board should take note of the concerning phenomenon, namely, fraud committed by management and implement focused oversight over the conduct of management. In this regard, the board should task its committees, such as the audit and risk committee as well as the finance committee, to improve and enhance their oversight over the performance of management. Management should be dealt with appropriately should they be found to have overridden or circumvented internal controls to commit fraud. Such measures should include instituting disciplinary, criminal, and civil action against them. Internal auditors and forensic investigators should be cognizant of this phenomenon when they scrutinize the

internal control environment because unscrupulous members of management could intentionally design and implement weak internal controls with the objective of exploiting the deficiency to commit fraud. The board should inculcate an ethical culture within the organization by obliging its leadership to lead by example and taking stringent action against management who engage in dishonest and/or unethical behavior. Whistleblowing mechanisms are recognized globally as an essential fraud prevention initiative to detect unethical leaders. Although whistleblowing is reactive by its nature, it also serves as a deterrent (threat) to potential fraudsters that they could be reported for suspicion of committing fraud.

# Ethical Leadership

Werner Webb
University of South Africa, Pretoria, South Africa

## Synonyms

Deontology and study of duty; Ethical and morally correct; Utilitarianism and greatest happiness to the greatest number; Virtues and moral excellence

## Definition

Ethical leadership is the demonstration of normatively appropriate conduct through personal actions and interpersonal relationships and the promotion of such conduct to followers through two-way communication, reinforcement, and decision-making.

## Introduction

In this entry, the theories and conceptual models of ethical leadership will be described. Perhaps, it is necessary to first reflect on why ethical leadership is considered so important. The importance of strong leadership and role models impacts directly on the organizational climate and the way people behave within an institution (Kaptein et al. 2005: 299–311). According to Lawton and Paez (2014), the decisions by leaders may be far reaching, non-routine, and complex, with high stakes, and require the exercise of judgment, and not the application of rules. Whereas subordinates follow policy prescription and emulate the behavior of their leaders, leaders are often confronted with a much greater area of decision-making discretion and consequently have to make a choice between conflicting values. It could also be argued that ethical leaders are more effective too. According to Lawton et al. (2013: 166), ethical leaders often inspire employees to be more optimistic and take more initiative which leads to them to experience their work as more meaningful.

## Complexity of Public Service Leadership

According to Heres (2014: 61–66), this ethical leadership context is determined by three variables including public service motivation (PSM), the nature of organizational tasks, and the influence of stakeholders. Public service motivation reflects a person's desire to serve the public interest, one's loyalty to government, and to strive for social equity. Managers in public service institutions may expect subordinates to be intrinsically motivated to serve the greater good and could consider communication on ethics to be unnecessary. Such individuals are often less dependent on monetary and other extrinsic motivations. Secondly, where private institutions are required to maximize profit, public institutions are required to enforce the law and policy, serve the public interest, and provide services that are unavailable in the marketplace. It can be assumed that the nature of dilemmas in the public space would be more pronounced as compared to those in the private sector. Finally, the demand by stakeholders in the public sector could exceed those applied in the private sector. Public institutions are subject to political dynamics and external oversight that could serve to inhibit the decision-making discretion of public service managers.

Heres and Lasthuizen (2012: 441–466) investigated the differences between ethical leadership in public, hybrid, and private sector organizations. The authors preferred a qualitative research design and used semi-structured interviews to collect data. They found significant differences between ethical leadership in public, private, and hybrid institutions such as a greater outward focus of leaders in public and hybrid institutions and the preference of leaders in the private sector to use more implicit mechanisms to communicate ethics and integrity.

## Ethical Leadership in Context

Heres (2014: 38) defines ethical leadership as the demonstration of normatively appropriate conduct through personal actions and interpersonal relationships and the promotion of such conduct to followers through two-way communication, reinforcement, and decision-making. Heres, however, is explicit in describing ethical behavior to be context specific. Normatively appropriate conduct depends on inter alia the institution's own moral norms and values, its primary and secondary values, and the society at large (Heres 2014: 36). Expectations of ethical leadership depend on other variables too, e.g., structural characteristics of the work environment, level of formalization, and work context. The work context may require a leader to demonstrate more task-orientated behavior or more people-oriented behavior (Heres 2014: 56).

Jurkiewicz (2006: 245–256) used Toni Morrison's novels to explore the meaning of ethical leadership: *Sula*, *Beloved*, and *Paradise*. At the outset, she emphasized the importance of the informal organization and the exercise of ethical leadership through the use of power rather than authority. In her view, leaders should demonstrate character of high morality and allow subordinates evolution of increased ethicality. To Jurkiewicz, ethical leadership in the public sector is much more important than in the private sector simply because of the high standards expected in terms of human rights, independence, freedom, and prosperity. In her analysis of the three novels, ethical leadership should be associated with decisiveness, independence, and assertiveness combined with a concern for the common good; the imperative to focus on the future rather than to be concerned with past mistakes; and finally, the importance of questioning current beliefs and not protect the status quo from outside influences.

## Ethical Leadership Defined

If it is accepted that ethical leadership is important, then what constitutes such behavior? According to Lawton and Paez (2014), behavioral integrity refers to the alignment between an actor's words and deeds and consistency between a person's beliefs and the way they act. To become an ethical competent leader is not a once-off affair; it is a lifelong endeavor (Menzel 2015: 317). Ethical leaders should be consistent,

coherent, and constant in their decision-making, but also honest, fair, respectful, approachable, loyal, and open toward followers (Heres 2014: 45; cf. Lawton and Paez 2014). Ethical leaders should reflect on the moral implications of their decisions and actions, the end goals they set, and the means they use to achieve these goals (Heres 2014: 45). According to Menzel (2015: 317), ethical leaders should consider the utilitarian trap, calculating the best outcome for most employees. Menzel cites the example of rewarding all employees with the same pay increase: those who work hard as well as those who do not. Although this may make most employees happy, it may not be the right thing to do.

As acknowledged above the impact of ethical leaders is wide. Such leaders are not ethical for the sake of earning some form of spiritual recognition. Ethical leadership is the layer between the ethical culture imbedded in its policies and programs on the one hand and its ethical climate, employee ethical reasoning, and behavior on the other hand (Lawton et al. 2013: 167). Furthermore, ethical leadership requires not only self-motivation but also the ability to motivate others. In terms of social identity theory, followers identify themselves with their leaders when the leaders are fair, just, and caring. Followers emulate the leaders' ethical behavior (Heres 2014: 45).

## Attributes of Ethical Leadership

In shaping our understanding of how ethical leadership works, we could reflect on the attributes of this phenomenon. Edwards' (2010: 93–109) ethical leadership constitutes the following roles: to place institutional interest above personal interest, to create formal mechanisms to enforce ethical conduct, to establish an ethical culture, to act as role models to establish a positive ethical climate, to promote ethical decision-making, to create living conversations about ethics and values among subordinates, to create mechanisms of dissent, and to create a system of shared values within the institution. Edwards provided a to-do list for ethical leadership which includes various dimensions including bringing about inter alia ethical alignment, ethical enforcement, and ethical impetus. Ethical alignment is achieved by promoting ethical decision-making in all day-to-day activities, whereas ethical enforcement aligning is brought about by enforcing policies, rules, and codes of conduct. Ethical impetus refers to leading ethical initiatives and rewarding ethical behavior. Her take on servant leadership also seems relevant to the discussion on ethical leadership. Servant leaders – in her view – promote moral reasoning and moral actions and value institutional interests over self-interest.

Kaptein et al. (2005: 299–311) also reflect on the attributes of ethical leadership. When managers are perceived as positive role models, set reasonable performance standards, and are committed to upholding the institution's standards of conduct, it could have a positive impact on the organizational climate and the way employees behave. Furthermore, when employees feel comfortable to report observed cases of malfeasance to their managers, positive perceptions of the quality of ethical leadership are promoted.

## Ethical Leadership Styles

In the study by Huberts et al. (2007: 587–607), the impact of different ethical leadership styles on integrity violations by police officers was investigated. The authors distinguish between three qualities of ethical leaders inter alia: as a role model, strictness of the manager, and openness of the manager. Whereas role modeling and openness are regarded as part of the value-based approach, strictness is regarded as a compliance-based approach.

The authors developed four separate hypotheses. In the first three hypotheses, the authors propose that the display of integrity in managers' behavior (role modeling), more strict enforcement of ethical norms and the punishment of wrongdoers, and greater openness by managers when discussing ethical dilemmas would lead to integrity violations. All three hypotheses were confirmed. While role modeling has the widest impact on the measured integrity violations, the strictness and openness have an impact on 75% of

the integrity violations. Role modeling appears to be the most important means to ensure a reduced level of integrity violation. In the final hypothesis, the authors propose that integrity-based leadership styles would contribute more than compliance-based leadership styles to reduced levels of integrity violations. The findings of this study refuted the hypothesis and suggested that strictness – as a compliance-based approach – is significantly underestimated (Huberts et al. 2007: 587–607).

## Ethical Leadership and Virtues

Different leadership roles may require the application of different virtues. When leaders create vision and purpose, the virtues of courage and imagination are important; ethical decision-making requires judgment, competence, and prudence, and inspiring others may require the virtues of honesty, transparency, and moral exemplar (Lawton and Paez 2014).

Bai and Morris (2014: 173–186) compare the influence of the Daoist model on ethical leadership to that of many Western philosophers. These philosophers distinguish between deontology, utilitarianism, and virtue ethics as the main schools of thought in public ethics. The Daoist model in essence suggests a contingency leadership theory. The Daoist module holds – similar to Western virtue ethics – that leaders should intuitively know how to deal with complex phenomenon. Every life cycle stage of an organization requires a different leadership style and the virtue ethics that fit in with that particular context. For example, when organizations are in the maturing stage, the critical virtue for leaders is faithfulness. Daoism remains a main source of belief, culture, and wisdom for the majority of Chinese.

Multidimensional measures of ethical leadership culture enable a more detailed assessment of how such leadership is enacted in practice. Different leadership characteristics and behaviors could curb different types of unethical behaviors (Heres 2014: 41).

## Moral Person and Moral Manager

Another such multidimensional conceptualization of ethical leadership is provided by Heres and Lasthuizen (2012: 441–466) where they describe the attributes of the moral person versus the moral manager. The authors investigated the differences between ethical leadership in public, hybrid, and private sector organizations. Their literature review pointed to the existence of two main dimensions of ethical leadership: the moral person and the moral manager. Ethical leadership of the moral person relates to the individual's moral character as well as the moral nature of the individual's own decision-making and behavior. Integrity, trustworthiness, and responsibility are the main moral traits of ethical leaders. Ethical leaders make decisions that are consistent, coherent, and constant and treat followers justly and fairly.

The moral manager dimension of ethical leadership relates to four subdimensions. *Role modeling* refers to the extent that the leader's behavior and decision-making are visible and salient, and negative and conflicting signals are not sent out. *Reinforcement* concerns the use of formal and informal measures to reward and punish virtuous or malicious behavior. *Communication* refers to the extent that leaders communicate the extent to moral implications of decisions and having open discussion of individual and organizational values. The last dimension of the moral manager refers to the *empowerment* of followers. Ethical leaders empower their followers to participate in decision-making and allow them to voice their own concerns and perspectives. Leadership should be strong in respect of both the moral person and the moral manager dimension (Lawton et al. 2013: 167).

However, Heres and Lasthuizen (2012: 441–466) are critical of their own conclusions and note that the ethical leadership measures provide little information on the traits and behaviors that they entail. For example, the communication of ethics by ethical leaders could be understood differently. In their study one respondent could score an ethical leader preferring more explicit

communication, while another respondent could score the same person expecting more implicit forms of communication.

## Moral Manager and Empowerment

Various authors have noted the positive impact of ethical leadership on employee moral judgment and the prevalence of integrity violations (Huberts, Six, van Tankeren, van Montfort & Paanakker, chapter 8: 7–8). As described above, ethical leadership constitutes two dimensions: the moral person and the moral manager. Heres (2014: 77–78) notes that empowerment – one of the key variables of the moral manager dimension of ethical leadership – requires ethical leaders to stimulate followers to think for themselves about what is, and what is not, acceptable behavior. Rather than communicate the rules, ethical leaders should emphasize the underlying principles applicable in a specific situation. By emphasizing principles rather than rules, ethical leaders leave space for interpretation and allow different interpretations of appropriate behavior.

## Measuring Ethics

Kaptein et al. (2005: 299–311) emphasized the value of surveys as an instrument to measure ethics and its potential in generating valuable information for the leadership of an institution. The information that surveys provide are even more beneficial when it is possible to track an institution's performance over time or draw comparisons between similar institutions. The authors emphasized that it is not only important to know whether institutions have ethics policy documents in place but also whether these documents have implemented these documents. For example, to what extent are employees informed of their ethical responsibilities or to what extent did employees receive ethics training? Surveys could also be used to determine the frequency and types of misconduct, as well as the presence of ethical leadership within an institution.

## Conclusion

Ethical leadership can be defined as the demonstration of normatively appropriate conduct through personal actions and interpersonal relationships and the promotion of such conduct to followers through two-way communication, reinforcement, and decision-making. Ethical leadership is context specific and determined by a number of variables including public service motivation, the nature of organizational tasks, and the influence of stakeholders. Ethical leadership in the public service should reflect the attributes of serving the public interest, enforcing the law, and being subject to external oversight. Although multiple theories on ethical leadership exist, Heres and Lasthuizen describe ethical leadership as a multidimensional concept. According to the authors, ethical leadership consists of two main dimensions: the moral person and the moral manager. Ethical leadership of the moral person relates to the individual's moral character as well as the moral nature of the individual's own decision-making and behavior. The moral manager dimension of ethical leadership relates to four subdimensions including role modeling, reinforcement, communication, and empowerment.

Role modeling refers to the extent that the leader's behavior and decision-making are visible and salient, and negative and conflicting signals are not sent out. Reinforcement concerns the use of formal and informal measures to reward and punish virtuous or malicious behavior. Communication refers to the extent that leaders communicate the extent to moral implications of decisions and having open discussion of individual and organizational values. The last dimension of the moral manager refers ethical leaders that empower their followers to participate in decision-making and allow them to voice their own concerns and perspectives.

## Synonyms

Ethical practice; Youth mentoring

## Definition

Ethical mentoring is based on a set of ethical principles to guide volunteer mentors and the program staff who advise them as they strive to build meaningful and growth-promoting relationships with their protégés.

## Introduction

Mentoring programs have, in many ways, come of age. Youth mentoring programs, large and small, have proliferated through the U.S., and it is estimated that there are now millions of young people who have participated in formal youth mentoring programs. While significant attention has been paid to establishing evidenced-based practices for mentoring (Elements of Effective Practice 2015), less attended to are issues of ethics. Yet, the safety and efficacy of mentoring relationships in many ways depend on adult mentors carrying out their responsibilities in an ethical fashion. This entry summarizes a set of ethical principles established to guide volunteer mentors and the program staff who advise them (Rhodes et al. 2009). Derived from a consideration of ethical guidelines established for other forms of practice, including the American Psychological Association's (APA) Ethical Principles of Psychologists and Code of Conduct (2002) established for practicing psychologists and ethical guidelines established for youth workers in Great Britain and Australia, five general principles are identified and applied to youth mentoring (a) promote the welfare and safety of the young person, (b) be trustworthy and responsible, (c) act with integrity, (d) promote justice for young people, and (e) respect the young person's rights and dignity. Each defined below, with the general principle from the APA Code of Ethics (2002) on which it is based notes in parentheses, these guidelines are relevant to the wide range of youth mentoring relationships (e.g., face-to-face, online, and group mentoring) and, potentially, to other voluntary adult-youth relationships. Also offered are examples, drawn from research and practice in

youth mentoring, that illuminate the application of the principles.

## Ethical Principles for Youth Mentoring Relationships

### Promote the Welfare and Safety of the Young Person (Beneficence and Nonmaleficence)

Predicated on the foundational principle of "do no harm," mentors should foremost work to benefit their protégés. The concept of beneficence encompasses behavior that benefits the good of another and that seeks to avoid causing harm. Thus, a mentor's primary responsibility is to take morally positive action to promote the welfare of the young person. Unfortunately, what is morally positive is not always clear, as there may be times when there are competing ideas about what is best for a young person, each rooted in differing values, culture, and worldview. For example, a parent might do something (e.g., discourage participation in a competitive summer math camp so that the teen can work in the family store) that, from the mentor's perspective, may not seem to be in the best interest of the youth and raise questions for the mentor about how to act in response. It may, however, make perfect sense when considered within the broader social ecology of the family. Promoting the welfare of a young person will, in many cases, require that mentors build rapport not only with protégés, but also with the protégés' primary caregivers to develop an understanding of the family's circumstances, belief systems, and expectations for the child.

The imperative to "do no harm" can also raise complex issues. Fortunately, the indidence of the most egregious forms of harmful behavior, such as abuse, is low (Saul and Audage 2007), even well-meaning volunteers need skills, knowledge, and sound judgment to avoid more subtle forms of harm that can arise from the misuse of power (e.g., exploitation, heavy-handed persuasion) and inappropriate boundaries (e.g., breaching confidentiality, improper disclosures).

*Misuse of Power.* A mentor's power (i.e., position, knowledge, experience, interpersonal connections, and other material and human resources, etc.) can serve as a form of social capital that can be deployed to the advantage of protégés. Mentors may use their connections, personal and professional experience, and other resources to help protégés gain desired information, status, position, influence, and various achievements. At the same time, while mentors may intend to support and "empower" youth, they can inadvertently misuse their power when they are unaware of power differentials in mentoring relationships that can be further widened with differences in class and cultural backgrounds. For example, mentors may express beliefs that are at odds with those of their protégés, creating conflict for the young person. Mentors should thus strive to refrain from religious or political proselytizing, raise their own awareness of power dynamics, culture- and class-based privileges, and overall cultural sensitivity, while seeking consultation to negotiate these differentials.

*Inappropriate Boundaries.* Appropriate boundaries, considered to be a hallmark of successful helping relationships, protect mentors and protégés from exploitation and are thus vital to the health of mentoring relationships. Mentors fill a niche that lies somewhere between professional and kin and are thus afforded greater latitude in what constitutes appropriate boundaries. So, whereas some guidelines for professional helping relationships are easily translated to the mentoring context, such as prohibitions against sexual relationships, additional guidelines for boundaries in mentoring relationships must be carefully considered. Negotiating boundaries in these relationships often require consideration of the specific context of mentoring. For example, although there is nothing inappropriate in a mentor holding hands with his 6-year-old protégé as they cross the street, other instances of physical contact or seemingly benign behaviors can be interpreted differently.

Mentors should also be aware of the potential harmful effects of certain types of multiple roles on their relationship with protégés. They should avoid entering into professional, financial, or other relationships with their protégés (and family members) if such a relationship might interfere

with their ability to work effectively as a mentor or might harm or exploit the protégé. For example, although parents might naturally gravitate toward their child's college-aged mentor when looking for a paid math tutor, the volunteer may better serve the parents by connecting the family with other resources. In other instances, mentors may find themselves encroaching on the territory of professionals in the child's life (e.g., tutors, juvenile probation officers). Mentors should be mindful of situations in which protégés make disclosures that would be better handled by a parent or professional and suggest that the child take his or her concerns up with them.

### Be Trustworthy and Responsible (Fidelity and Responsibility)

This principle is rooted in the ethical notion of fidelity, or behaving in a trustworthy manner. For volunteer mentors, this involves fulfilling one's responsibilities as stipulated by the mentoring program, such as meeting frequency and match duration. This type of consistency and reliability – which has been associated with more positive outcomes for youth participants – serves as a basis for trust in the relationship. Indeed, protégés have reported that honesty, keeping promises, and relationship longevity underlie trust.

Avoiding premature terminations and engaging in a positive closure process when a match does need to end are also important aspects of trustworthiness. Volunteer mentors may not be aware of the negative impact early endings may have on some youth and may also not understand the importance of ending a relationship well, especially if they feel uncertain about how meaningful the mentoring relationship has been for the youth. Pre-match training that includes an emphasis on helping mentors understand the importance of avoiding early and unplanned terminations can help support mentors in adhering to this ethical standard. Such training can also address two potential causes of early terminations. First, mentors may hold idealized notions at the start of a mentoring experience that may cause them to become discouraged if they interpret a child's lack of engagement as deliberate, rather than stemming, for example, from a history of disappointment or abuse. Others might feel shame at their failure to connect with a child or fulfill their commitment, and chose to avoid rather than honestly confront the situation. Programs can inform mentors of common challenges and phases in mentoring relationships and offer training and supervision to assist mentors in navigating these in a trustworthy and responsible way.

### Act with Integrity (Integrity)

Related to the principle of fidelity and responsibility is mentors' obligation to be thoughtful and forthright about the commitments (i.e., time, financial) to the relationship and to avoid setting up false expectations. A mentoring relationship, like any other interpersonal relationship, holds the potential for communication breakdowns, which can have negative consequences for both parties. Families can fail to return a call or follow through on an appointed meeting time. Moreover, mentors may hold unrealistic expectations regarding the nature of communication they expect to receive or may fail to return calls promptly. Mentors should be expected to bear the greater responsibility for finding ways to effectively communicate with their protégés, to honor commitments, and to seek guidance from mentoring program staff should they find that they are unable to do so.

Mentors should also conduct themselves with integrity in their protégés' schools, homes, and communities by being respectful of customs and regularities. Finally, although there are always exceptions, mentors should be wary of entering into financial arrangements with protégés or their families. Although it might seem harmless for a mentor to cover 1 month's electricity bill, particularly when rationalized in terms of helping the protégé, this may have the unintended consequence of establishing expectations of further (and perhaps greater) assistance. Nonetheless, there are ways in which a volunteer can express generosity without complicating the relationship. A volunteer's desire to fund a child's summer camp could, for example, be brokered by the mentoring program through an "anonymous" scholarship donation.

### Promote Justice for Young People (Justice)

Volunteers must take care to be aware of cultural biases and to avoid making assumptions about mentees' that are based on, or insensitive to, the latter's social class, gender, or abilities. For example, mentors volunteering for programs serving children with incarcerated parents should check any assumptions and biases they might have about the prison population that might compromise their judgment and ability to treat protégés and their families with fairness and respect. Mentoring programs must provide training in cultural competence and gender sensitivity so as to raise volunteers' awareness of their own biases and blind spots.

From a positive perspective, mentors' close personal connections with diverse youth afford them the opportunity to develop a firsthand understanding of the challenges faced by young people today, which can inspire them to work for greater justice through advocating for policies that could improve the health and well-being of all youth living in these kinds of circumstances.

### Respect the Young Person's Rights and Dignity (Respect for People's Rights and Dignity)

This ethical principle is partially rooted in the moral principle of self-determination and involves respecting a young person's (and his or her family's) choices. Except in extreme situations (e.g., abuse, neglect, endangerment), volunteers should seek to understand and respect the decisions and lifestyle of a young person and his or her family (Beauchamp and Childress 2008). Respect for self-determination involves behaving in ways that enable protégés' and their families' ability to exercise their own reasoning and moral judgment. Mentors should seek to understand the youth's own personal goals, desires, and values. Attending to the protégé's right to privacy and confidentiality is another way mentors can respect and support their rights and dignity. Youth and parents often disclose deeply personal information to volunteers, sometimes with specific injunctions against sharing it with the other. For example, parents have disclosed to volunteer mentors highly sensitive information about themselves (e.g., HIV infection, paternal incarceration), which has not been shared with the protégé. Complex issues can also arise around the flow of information among mentors, teachers, and parents. Mentors sometimes share private information about their protégés and their protégés' families to schools or share with parents information that has been provided to them by school staff.

Similarly, protégés often make disclosures (e.g., regarding substance abuse, sexual behaviors, or orientation) and ask mentors to keep information from their parents. Having a place to share private thoughts and feelings is an aspect of mentor relationships that youth find especially important (Spencer et al. 2004). Nonparent adults can serve as important sounding boards for youth, particularly in adolescence when youth are exploring their identities and may experience new forms of conflicts in their relationships with their parents (Allen et al. 1998).

Serving as a confidante to young people can, however, involve difficult decisions about what information should be kept confidential and what needs to be disclosed. Mentors should inform their protégés of their obligation to break confidence should the protégé disclose intentions to be harmful to themselves or others. Similarly, mentors are obliged to report to the mentoring program any suspicions that their protégé has been subject to abuse or neglect.

In less extreme cases, a mentor's desire to build trust can complicate decisions about whether and when to violate confidentiality. A parent might feel betrayed by a volunteer mentor's decision to keep information about their child's transgressions in confidence. Yet the volunteer might fear that breaking the protégé's confidence would compromise the relationship. Training around issues of confidentiality should be provided, and decisions regarding such matters should be made in consultation with mentoring program staff.

## Conclusion

The ethical principles delineated here are purposely broad. Although youth mentoring shares many of the conventions of more professionalized

helping relationships, the informal and voluntary nature of this endeavor releases it from some of the more rigid proscriptions that govern such ties. A more detailed set of guidelines would be difficult to apply to the many different types of mentoring relationships. Further, more prescriptive guidelines would likely limit mentoring relationships in ways that could inhibit the open and natural qualities that make them special relationships in the lives of youth. At the same time, mentors often enter into the lives of children in very personal ways and, as such, should be held accountable for protecting their rights and welfare. The principles are thus presented as aspirational goals (Fisher 2003), intended to raise ethical awareness and to encourage more studied reflection on the complex situations that inevitably arise when caring adults enter the lives unrelated youth. Programs have an obligation to sensitize volunteer mentors to the ethical issues that can arise when working with unrelated youth, to offer guidelines on how to support and nurture the positive development of children, and to clearly communicate these expectations through training and ongoing support. Comprehensive pre-match and ongoing training, which takes developmental, gender, and cultural issues into account, could ensure more effective relationship development, helping mentors to better understand and relate to protégés of diverse backgrounds, avoid ethical violations, and create more positive outcomes.

[2]Utrecht School of Governance, Utrecht, The Netherlands

## Synonyms

Ethics; Integrity; Integrity management; Integrity violations

## Introduction

The car industry, sports associations, and financial institutions are just a few examples of sectors that recently have been discredited by serious ethical transgressions. The impact is enormous. In addition to economical damage, such integrity violations often hinder fair competition, can lead to environmental and public health risks, and deeply affect the personal lives and well-being of citizens. This also applies to the public sector where such improbities unfortunately occur as well.

Although public sector organizations pay more and more attention to ethics and integrity nowadays, ethical probity has always been important to the public sector. As the fourteenth century frescoes of "Good and Bad Government" (Meoni 2005) demonstrate, the concern for ethical probity and, more precisely, public integrity has a much longer tradition. These frescos in Siena's Palazzo Pubblico (its former city hall) were intended to remind public office holders to act with integrity. The wall paintings served as an early code of conduct, based on Aristotelian virtues like courage, justice, prudence, and temperance, and provided ethical guidance to the city's governors and administrators. The tantalizing images illustrate that good (ethical) governance leads to a well-maintained, safe, and prosperous city, whereas bad (unethical) governance results in poverty, injustice, and ultimately total chaos. Indeed, public integrity is as old as government itself (Bowman and Williams 1997).

This entry provides an overview of the key elements of ethical probity in the public sector: what is it, where does it go wrong, and how can it be managed? To this end, the first section describes the general importance of public integrity. The concept of public integrity is explored and defined more in detail in the second section. To give more substance to the concept of public integrity, typical integrity violations and their effects are reflected upon in section three, followed by a discussion of their underlying causes (section four). The fifth and final section centers on integrity management. More specifically, an extended integrity management approach, which distinguishes between hard, soft, and general instruments, is presented. This trichotomy is both more practical and precise than the traditional compliance-integrity classification (Paine 1994), which tends to neglect the organizational and institutional aspect of integrity management.

## The Importance of Public Integrity

The importance of integrity is generally formulated in terms of the reinforcement of the constitutional state (Cowell et al. 2011), the enhancement of public trust (Lewis and Gilman 2005), and the improvement of economic growth, social stability, and quality service delivery (Bossaert and Demmke 2005) and as the

cornerstone of good governance (Huberts et al. 2008). Table 1 summarizes some arguments frequently used in the literature. As the table indicates, one can distinguish between (external) societal and (internal) organizational arguments for fostering public integrity. While societal arguments tend to be primarily normative in nature, organizational arguments are generally supported by empirical research as well. Moreover, arguments on the importance of public integrity are often framed both as satisfiers and as dissatisfiers (Kaptein 2005). Hence, the value of public integrity lies not merely in its positive effect on behavior and performance but also in the negative effects that a lack of public integrity implies.

**Ethical Probity in Public Service, Table 1** External and internal arguments for ethics and integrity

| Societal arguments | Organizational arguments |
|---|---|
| The government is extremely powerful, is authorized to use violence, and holds a monopoly on, for instance, issuing passports, subsidies, benefits, permits, and licenses. This creates a lot of dependency | An unethical organizational culture leads to feelings of fear, uncertainty, and psychological insecurity. Employees are aggravated by unethical behavior of their coworkers |
| The government is funded by taxes. Taxpayers have the right that their money is spend on behalf of the general interest, instead of on the private interests of government officials | Organizational integrity contributes to employees' general well-being, work satisfaction, work motivation, organizational trust, and commitment; it leads to better work relations and performance and to more prosocial employee attitudes and reduces work stress, emotional exhaustion, and sick leave |
| To be able to function effectively and efficiently, the government requires legitimacy. Ethics and integrity are a prerequisite for attaining and maintaining public support | Organizations with a good reputation and which are known for their high ethical standards are more attractive. For such organizations it is easier to employ high-quality personnel |
| The government has to lead by example if it wants the citizens to abide to the law and public morale. Ethical role modeling is thus of utmost importance | Integrity violations cost a lot of money, damage the organizational reputation, and hamper the due functioning and service delivery of the organization |

## Integrity and Ethics: Definitions

More than a century ago, the German philosopher Friedrich Nietzsche argued that integrity is a recent virtue: it is not yet mature, is often misunderstood, and is something in the becoming (Wurzer 1975). To this day, however, integrity remains a term that is not yet fixated and lacks a broadly accepted meaning. The inherently dynamic nature of the concept means it is highly sensitive to changes over time, situation, and place, which contributes to its complexity. Thus, while integrity is a strongly upcoming theme in public administration research (Menzel 2015) and notwithstanding the many efforts to bring together different views, integrity remains an essentially contested concept (cf. De Graaf 2003).

To further complicate matters, the terms ethics and integrity are often used as synonyms. Some conceptual clarity is needed, however. According to Huberts (2014), integrity refers to acting in accordance with relevant moral values and norms. The adjective "moral" is important here since it underlines that integrity pertains to values and norms that are strongly vested in, and connected with, shared societal opinions and judgments about what is considered right and wrong. Integrity is thus about doing the right thing, in the right way (Heywood and Rose 2015), within a specific context. More specifically, whether someone can be said to have acted with integrity is judged not only in relation to the organization's own moral norms and values but also to the collection of norms and values held by its primary and secondary stakeholders, e.g., citizens, the various (private) organizations affected by public policy, and, ultimately, the (international) society at large (cf. Six et al. 2007). It follows that integrity is a dynamic construct, for which the moral standards may vary over time and even per public organization (Hunter 2012) as standards are defined by varying sets of primary and secondary stakeholders.

Ethics on the other hand is a much broader concept and often refers to the policy content and outcomes, which is much more related to moral-political choices. Typical examples of policy ethics include whether a country should go to war, whether drugs should be legalized, how we feel about euthanasia, medical care, nuclear energy, biodiversity, and similar strong issues. Nevertheless, in both public and business administration literature, ethics is often used as a synonym for integrity. But as long as the context is clear and we are able to understand whether we are concerned with (internal) organizational processes, procedures, policies and behavior (integrity), or the broader moral-political issues (ethics), this is not particularly problematic. Following this line of reasoning, and in line with common practice in this field of research, the concepts integrity and ethics are thus used interchangeably throughout this paper.

## Ethical Improbity: Examples and Effects

To give more substance to the concept of integrity, it helps to give some examples of integrity violations that actually occur in the public sector and of the effects such violations may incur. Without having the ambition to be exhaustive nor to describe the whole possible array of integrity violations in detail, a rough distinction can be made between material and social integrity violations.

Material integrity violations involve financial or other benefits for private gain, such as corruption, fraud, theft of company resources, accepting gifts, the misuse of information, and conflicts of interest. Social integrity violations on the other hand are linked to all kinds of inappropriate work floor behavior. This refers to unethical conduct between colleagues, between management and their employees, and between civil servants and citizens. Examples include discrimination, intimidation, sexual harassment, bullying, and the misuse of power but also the misconduct of civil servants in private time which compromises their formal position and the reputation of their organization.

Integrity violations are closely related to other forms of employee deviance, rule breaking, and counterproductive behavior (Lasthuizen et al. 2011). As such, the boundaries between unprofessional behavior and integrity violations often remain unclear in practice. Moreover, within the public sector especially, there are signs of increasing *integritism*: integrity judgments are made without sufficient grounding, either because the norms and values in question are exaggerated and not of fundamental moral importance or because judgments about aspects of behavior are generalized to persons or organizations as a whole (Huberts 2014).

As noted above, integrity violations have important negative effects on both the internal and the external organization. More specifically, four characteristic consequences of integrity violations can be distinguished: snowballing, contamination, revelation, and radiation (see Table 2). These effects illustrate that integrity violations, even the smallest ones, should be taken seriously and call for immediate action.

## Drivers for Ethical Improbity

In recent years, public scrutiny seems to have intensified and "watchdogs" like the media, NGOs, courts of audit, scholars, and citizens certainly have become more focused on the misuse of public resources and power. It could even be argued that integrity programs and training – that to some extent have been implemented within most public organizations – have made management and employees more aware and sensitive about possible wrongdoing, leading to more internal reporting and investigations. This makes it difficult to determine whether there are more integrity violations than before or whether they are merely uncovered more often, a phenomenon that Huberts (2014) also refers to as the "integrity paradox."

Whether it is merely increased sensitivity or an actual increase in violations, every integrity violation is one too many since public trust is at stake. Understanding the causes of integrity violations is thus crucial: it makes us more aware of integrity risks, and it enables us to redress them. Among the causes are many "likely suspects."

**Ethical Probity in Public Service, Table 2** Four effects of integrity violations. (Adapted from Niessen 2004)

| Effects | Description |
|---|---|
| *Snowballing* | Small incidents of unethical behavior tend to grow out to bigger ones. Not addressing unethical behavior in time, and turning a blind eye, signals out that it is okay. This enhances the risk that trespassers will engage more frequently, and on a larger scale, in integrity violations |
| *Contamination* | Unethical behavior of an employee tends to infect other colleagues. Violations that are ignored, or not dealt with properly by the organization, could be interpreted as being acceptable. This enhances the risk that others in the organization feel justified or encouraged to do the same |
| *Revelation* | Transparency is an important public sector value. Civil servants operate in a fishbowl, constantly watched from all directions and examined under the magnifying glass. Integrity violations are thus likely to be discovered and revealed by the media, often leading to public outrage and diminishing public trust |
| *Radiation* | Unethical behavior within a certain part of the civil service is damaging for the reputation of the entire civil service. Citizens and the media generally do not make a distinction between the different parts of public administration. Hence, integrity violations are attributed to the whole public system and thereby undermine its credibility |

Often mentioned causes at the individual level are, for instance, having financial problems, addictions, and wrong friends. In addition, susceptibility for social and material standing, group pressure, and the lack of self-confidence are mentioned in psychological assessments as possible predictors for unethical behavior, as are high scores on character traits like pride, greed, and vanity.

However, many integrity violations are committed not by employees who were initially planning to act unethically ("bad apples") but rather by employees who were infected (contaminated) by an "unhealthy" organization ("bad barrel"). Unrealistic targets, unethical leadership, unclear or contradictory rules, failing internal procedures and control systems, group pressure, too much autonomy, underpayment, and too many seductions are frequently mentioned as drivers for unethical behavior (Kaptein 1998). Similarly, the ethical climate in the organization and the extent to which ethics codes are in place and enforced help to create a social environment in which individuals are more or less likely to engage in ethical behavior (Kish-Gephart et al. 2010). To quote the French writer Victor Hugo (1862): "If the soul is left in darkness, sins will be committed. The guilty one is not he who commits the sin, but the one who causes the darkness." Hence, in case of integrity violations, it is not enough just to detect and remove the "bad apple": attention should also be paid to flaws in the organizational structure and culture that infect the "apples."

Likewise, societal developments and trends at the macro level also interact with causes at the meso- and microlevel to produce unethical outcomes. To illustrate, the recent financial crisis has led to austerity measures and budget cuts across the public sector. Growing job insecurity (postponed promotions, not-extended contracts, layoffs) raises stress, frustration, and feelings of unfairness on the work floor. This is a source for vindictiveness against the employer (Hoekstra 2016). It makes employees more likely to flirt with impropriety and can thus result in the abuse of company assets, theft, and other integrity violations (Treviño and Nelson 2004). At the same time, organizational changes such as restructuring and budget cuts negatively affect the time, resources, and attention organizations (can) spend on ethics programs (Treviño and Weaver 2003). Combined, both trends (higher risks and less resources for ethics and integrity management) provide the ingredients of a rather poisonous cocktail.

To conclude, then, unethical behavior is seldom explained by one or two dominant causes (Kish-Gephart et al. 2010). Instead, integrity violations are the result of a complex array of interacting and often mutually reinforcing factors across individual, organizational, and societal levels.

## Safeguarding Ethical Probity

Given the complex, multi-determined nature of integrity violations, there is no *one size fits all* solution to safeguarding ethical probity. Most academic research, however, focuses on remedies and policies at the organizational level. These, after all, are within the direct control of the organization and are therefore considered the most viable and realistic measures for public managers to implement. Moreover, they address the organizational obligation to be a good employer: given their direct influence on the moral behavior of employees, organizations have an implied responsibility for supporting their employees and protecting them from "un-ethicalities" through the implementation of comprehensive integrity policies.

To manage the complexity of organizational integrity, a wide range of initiatives and instruments is needed. Most studies, in both public and business administration, refer to the seminal work of Paine (1994), in which she distinguishes between two types of strategies. The "compliance" strategy is a strongly rules-based and top-down approach intended to prevent noncompliant behavior. The "integrity" strategy is a values-based and bottom-up approach intended to increase the moral competence of employees. Instead of preventing wrongdoing, the second strategy aims to support employees in making the "right" decisions. Depending on the specific situation of an organization, a combination of both strategies is generally considered to be the most effective way (Lawton et al. 2013).

The abstract, conceptual distinction between these two strategies is problematic, however, for three reasons. First, the term "integrity" strategy is confusing in itself since both strategies can (and should) be used to foster integrity. Secondly, instruments can belong to both strategies. Training sessions belong, for instance, to the compliance strategy, when they are focused on educating and communicating integrity rules, but when they are aimed at raising moral awareness and competence, then they match with the integrity strategy. The same applies to the code of conduct. When it is essentially rule-driven and centrally imposed, it should be labeled as a compliance instrument, but when it is value-driven and the result of a company-wide (bottom-up) approach, then it seems to fit the integrity approach. Third, features that pertain to the institutional aspects of integrity management have an unclear position within this dichotomy. Most scholars (seemingly intuitively) attribute these aspects to the compliance approach. Yet setting up ethics structures and procedures and conducting risk analysis but also formalizing, monitoring, evaluating, and adjusting policies are fundamental requirements for the success of both the compliance and the integrity strategy. For instance, efforts to improve the ethical climate of an organization (integrity strategy) should also be designed, documented, planned, and monitored and require a coordinating role for an integrity officer.

For reasons of clarity and to do more justice to the foundational role of the institutional aspects of integrity management, a trichotomy seems more accurate and practical. Following Paanakker and Heres (2015), a division between the "hardware" and "software" of integrity management is proposed. In line with their used computer metaphor, and to emphasize the overall importance of the institutional dimension for both the hard- and the software, the "operating system" could be added as the third dimension of an integrity approach (Hoekstra et al. 2016). Table 3 describes the resulting trichotomy of integrity management.

The trichotomy of integrity management highlights the different dimensions of an integrity management approach. The first two entail content-related elements and instruments, whereas the third one is of a more procedural nature that pinpoints the organizational (systemic) efforts focused on the institutionalization of integrity. It refers to the process of advancing its sustainability, since care for integrity should be a continuous effort rather than an incidental action. Inspired by Transparency International's Greek temple as a metaphor for the constituting parts of a National Integrity System, the three dimensions are visualized in Fig. 1.

**Ethical Probity in Public Service, Table 3** Dimensions of an organizational integrity approach

| Integrity management | |
|---|---|
| Software | This dimension concerns measures aimed at positively influencing the ethical culture within the organization through employees' internalization of (public) values. Ideally, the measures aim at creating a culture marked by openness, safety, mutual respect, and trust. Managers play a particularly important role in this. Examples of the "software" include introductory courses, ethical leadership, dilemma training courses, and the oath of office |
| Hardware | This dimension concerns the supervision, control, and enforcement of rules, procedures, and guidelines needed to support and reinforce the ethical culture of the organization. Finance, legal, audit, and HR departments play an important role in this. Examples of the "hardware" include procedures for procurement, contracting, and side jobs, as well as reporting and investigation procedures |
| Operating system | This dimension concerns measures intended to institutionalize and sustainably embed integrity policies in a systemic manner. To this end, a clear and shared vision is formulated that connects software and hardware measures and ensures their internal consistency and reinforcement. Integrity or compliance officers play an important role in organizing and coordinating integrity within organizations. Examples of the "operating system" include monitoring the number and nature of integrity violations, evaluation of policies, and risk analyses |

**Ethical Probity in Public Service, Fig. 1** Model for upholding public integrity

## Conclusion

Ethical probity is a necessary requirement for public sector organizations. In most literature the term integrity is used as a hallmark for ethical probity. Integrity is, however, an essentially contested concept since it is time, place, and context dependent. Integrity is also a very broad concept, considering the wide array of integrity violations. Such violations have serious consequences for government agencies and should be addressed adequately. It is more effective, however, to take preventative actions to avoid integrity violations and to guide public officials how they can do "the right thing." Recognizing that "one size fits all solutions" and blue prints do not exist; this article described some agreed-upon approaches how organizational integrity can be managed and how ethical probity can be fostered. Moreover, it argues that it is time to expand the existing compliance-integrity dichotomy and to include the procedural, institutional aspects of integrity management more explicitly. This organizational dimension, dubbed as the operating system, should be acknowledged more specifically. It provides a sustainable, systematic basis for ethical probity that unites the integrity hard- and software.

# Ethical Risk Management

Ronald D. Francis
College of Law and Justice, Victoria University, Melbourne, VIC, Australia

## Synonyms

Ethical; Ethics; Management; Managing; Risk

## Definition

TBA

## Introduction

This article argues that ethical risk is one of several risks that need to be accommodated. It is further argued that ethical risks are just as potent in consequences as are other risks, such as financial and reputational. Managing ethical risk is, essentially, about following a code and of not being corrupt: for that reason corruption figures prominently in such discussions. In particular there is a concern that an organizational code of ethics or a company code of conduct may be at odds with a professional code (medicine or

engineering, say). In such cases it is argued that the professional code is prime. Presumably a person is employed as an engineer or a medical practitioner and thus their subscription to appropriate professional standards is paramount. Any ethical charge therefore needs to express a particular breach in terms of at least one section of the professional code, rather than the organizational code.

### Ethics-Morals Distinction

In universities, it is common to teach ethics as moral philosophy and to use the terms rather freely. To this end it might be useful to make a distinction. Morals may be regarded as community standards, and not formally expressed (except in laws which exemplify them), and are applicable to the whole community.

Ethics, on the other hand, is a written code consisting of two parts: one is the code of ethics (the principles which underlie ethical decisions). The second is that of how to behave in particular situations (e.g., accepting gifts). In the case of ethics such principles are applicable to a particular category of persons (e.g., legal ethics, medical ethics, engineering ethics). If one is not a member of that fraternity, then one is not bound by that code. Further, ethical codes do not apply to those who are not members of a particular group.

The value of ethical judgments is that they are made in the light of a code rather than being a diffuse and inchoate expression.

### The Advantages of Being Ethical

One might say that there are significant advantages in being ethical. First is that acting according to agreed values puts stability of decision-making at the forefront; second, the expression of ethical values means that more considerate standards are enjoined. To this one might add that the consequences are that the trust engendered is likely to lead, in the case of agencies to satisfaction with the service, in the case of business to repeat patronage without further advertising costs. It is, in other words, a long-term beneficial strategy. One notes that con-persons rest their practice on a totally different assumption – that of not seeing their victims again. Among the significant reasons for being ethical is that it may act as a substantial defense in cases where there is an alleged breach of principles.

It may seem that ethics is so value-laden as to defy any attempts to quantify. That is not so since some basic scaling techniques are available. One such is the basic "Which would you do: spit on the national flag or severely punish your child for a minor infraction?" It is thus that a direct comparison may be made. Another technique is to put money values on an issue: for example, "how much would it take for you to betray your country? Hurt someone who done you no harm? Administer corporal punishment to an innocent child?" One may rate, rank, or use pair comparisons in order to quantify (see Francis and Murfey 2015).

### Managing Risk

The prime target in ethical risk management is that of correctly identifying it. Among recent developments attention was drawn to the complexity of managing such risks as they are a compound of a variety of other factors, such as background, managerial philosophy, personality, decision theory, and reinforcement. Their article reviewed the literature to that date. Their conclusions were that managers engage with such issues as espousing ethics, ethical training, developing screening mechanisms, creating ethical units, and giving appropriate reinforcement (Stead et al. 1990).

Yet more recently Neef, writing in 2005, advocated managing corporate risk through better knowledge management. In this he is correct, although the topic does not mention managing ethical risk in the title, the main article does. To this, in the same year, there was a valuable meta-study. O'Fallon and Butterfield (2005) provided an overview of the 174 articles published in the period 1996–2003. Their review summarizes the findings by the dependent variable, using such issues as awareness, judgment, intent, and behavior. The conclusions that they drew involved finding that education and/or work experience is positively related to ethical decision-making, as is religion, and of having an ethical code. Age, on the other hand, does not appear to be related to

ethical behavior. What is clear is that rewarding unethical behavior enhances it.

Since that time risk management perception has changed, from being an aspect of governance to being at its core. Power (2008) argued that it has coincided with the rise of control and auditing processes. One must conclude here that, in addition to the advantages of being ethical, there is a protective mechanism at work that fears legal intervention that is made on good grounds. The legalities of increasing bureaucracy have generated the need for increasing protection in the face of reputational risks and of legitimacy.

## Corruption

Corruption is really the converse side of being ethical. It may take any one of many forms: the most obvious being such issues as bribery, the concealment of vested interest, and the misuse of public office for private gain. There can be no doubt that power corrupts and that absolute power corrupts absolutely. That is why it is incumbent on political systems to ensure that no one is in charge for an unlimited time or that no one person has unchecked power. One of the essences of democracy is that power is cut up between authorities; thus one must separate the legislature from the executive and that from the judiciary.

Corruption may be defined as "the misuse of public office for private gain, and involving elements of deceit, improper force, and of hypocrisy." Among the forms that corruption takes, Fig. 1 gives essential elements.

It is held that corruption is not an entity but, rather, a dimension. A clear example is a government official being paid a corrupt payment to approve a building project that would not otherwise be approved. At the other end of the spectrum is a political decision to charge full fees for a university education. That is not corruption but is a policy decision. However much one may disagree (if you think education is expensive, try the cost of ignorance) it is a matter of policy and outlook. If one were to put a marker at one end of the spectrum, a corrupt bribe, and policy decisions at the other, one could have a seven-point scale (for example):

Deceit
- Money laundering
- Forgery
- Abrogation of human rights
- Undeclared and unaffected conflict of interest

Loyalty, treachery, and betrayal
- Deciding on one's primary loyalty
- Betrayal of that loyalty

Political abuse of power
- Usurpation
- Suppression of a group (eg. women, religions)

Hypocrisy
- Stating one value of behaviour and acting another
- Holding inconsistent values

Physical abuse of power
- Torture
- Enslavement
- Restrictions on movement
- People trafficking

Secrecy
- Bribery
- Extortion
- Blackmail
- Theft

**Ethical Risk Management, Fig. 1** Elements of corruption

### Total Corruption 2 3 4 5 6 Policy Decisions

Political decisions may be corrupt or based on sound economic argument. The latter may reflect a value position that is not universally held. A bribe to allow a building that would otherwise be illegal, and as a result of a secret payment, would occupy position 1 on the scale above. Policy decisions would occupy position 7. For example, the notion of having students pay their share of costs for their degrees is a policy matter. It is just a policy decision, and there is nothing at all corrupt about it. At one extreme is the American version wherein gaining a degree is a costly experience. By way of contrast, Germany has made university education free. One can debate the merits of how a well-educated population should be costed.

In all of this one notes the general outlook of *Transparency International* that corruption flourished in secrecy, for which the antidote is transparency. One can imagine particular cases

for exemption: personal privacy of nonpublic relevance and the preservation of intellectual property, for example, but they would express exemptions rather than the norm. Where ethical values prevail there must be a concern. One of the classic definitions of corruption is where an official position of office is used for personal gain.

Given that transparency is the default mode, with specified exemptions, then particular merit accrues to whistleblowers. There is a need for prospective whistleblowers to ask themselves specific questions: provided they are satisfied in conscience that blowing the whistle is appropriate then they are to be admired (see Whistleblower's guide in references).

## Personality and Cultural Differences

There can be little doubt that the absence or presence of corruption is as normally distributed as any other personality quality: saints and looters are ever-present. What one needs to do is systemically foster ethical stances with use of systems such as cultivating an ethical culture, having a clear code, provide training, and rewarding ethical instances. Consistent with this is the ways in which some cultures are far more tolerant of corruption than are others.

The issues of how decisions are made are given in Ferrell et al. (2014). What is most instructive in their analysis is its comprehensive nature; what is less instructive is the distinctly Western orientation. One does need to be aware of are the varying values in other ways of doing business – a point more readily accommodated in Francis and Murfey (2015). As there are cultural differences, there is concern that such differences might make it difficult to agree on a common code. Taking a fairly simple decision, in the West it is common to allow interest to be charged: Under Shari'ah law, there is an expectation that profits and risks will be shared. These seemingly conflicting views need to be accommodated in any agreed code.

Here a case might be made for a commonly agreed set of standards, and one of universal application, being equally applicable to personal life, to business, and to politics and its agencies. Among such would be the eminence of transparency, of the eschewing of hypocrisy and deceit, the improper use of force, suppression, and any abrogation of the UN principles of human rights.

## Illustrative Case

Imagine a pharmaceutical company board considering donating out-of-date medicines to Third World countries and being motivated by genuine goodwill. The first question is the dating of the medications; for this, a technical question is in order, are the medications still of value despite their date? For this a skilled biochemist needs to answer that they are or are not the medications "do not use after" or "best used by . . ."

Suppose that they are still of value and the date is a "recommend use by. . ." then one goes on to the next question, "What if they are not administered by skilled staff?" One would need to ensure that it is a condition of use. A third question concerns corruption "What if they are illegally sold rather than being a free help?" together with the question "What would happen if it became known that shabby motives were attributed to us?" For this a solution would be to donate the medications to a respected organization, such as the *Red Cross* or *Medicin Sans Frontieres*, who would agree to the conditions imposed by the pharmaceutical donors.

Yet another issue is the ethical one of "They are not good enough for us, but alright for those others less fortunate." Here there is a real ethical dilemma. Imagine after a lively discussion at board level with the prevailing view that one gives in good faith so long as the predicted outcome is an improvement. There is no obligation to be perfect, but there is an obligation to leave the situation improved over what it would have been had there been no donation.

From all of this a consensual view emerges that the first risk is effectiveness, the second is control of conditions, the third is reputational, and the fourth is the principle of improvement. It will be seen from this illustration that ethical risk is a part of other risks, and the wish to do good may rebound unfavorably if they are not controlled.

In all of this, attitudes of board members are critical: They must see various types of risks as being interconnected and act accordingly.

## Conclusions

It is concluded that ethical risk is to be seen as part of overall risk management. That conclusion has the material benefit of enhancing reputations, bringing repeat satisfaction, acting as a defense in cases of false accusation, and being of benefit to the wider community. In politics, as in business, one might expect the primacy of ethical stances.

Managing ethical risk is seen as an important aspect of managing risk in general. Political risk is as much a part of its function as is direct decision-making on policy. It is, rightly, an offense to lie in the legislature but not an offense to lie to those who elected them, as political promises may be readily broken legislatures need to set a good example rather than castigate business for breaching the bounds of good ethics. As Bernard Shaw aptly remarked, children are in more need of good examples rather than they are of critics.

It is plain that the concern for values has benefits beyond the obvious: Values are not a superficial application but, rather, are at the core of a successful business. The concern for people is more than a simply practical issue – it is the core of being human: Labor is not just another commodity but is a fundamental issue.

# Ethical Values

George Reed
School of Public Affairs, University of Colorado, Colorado Springs, CO, USA

## Synonyms

Ethical code; Moral principles; Principals; Professional ethics; Value-system; Virtue

The field of ethics is a branch of moral philosophy that attempts to develop concepts, rules, principles, and standards of right conduct. The subset of ethics known as professional ethics seeks to discern a well-reasoned approach for practitioners who are charged with carrying out functions of professional activity as honorably and forthrightly as possible (Cook 2008). Public administrators are not necessarily trained as ethicists, but they are confronted on a daily basis with decisions that have significant implications for the communities they serve. Values are an important concept when discussing right and wrong, and this is especially so in public administration due to the myriad conflicts and dilemmas inherent in the public sector. As an example, it is good to protect the rights of individual property owners, and it is also good to ensure access to land for expansion of infrastructure projects such as roads and airports that benefit the public. Most will recognize the conflict and tension associated with decisions surrounding the imposition of imminent domain whereby the

state can take private property for public use. Competing goods and trade-offs of policy implications in terms of those who benefit and those who pay are part and parcel of the study and practice of public policy and administration. How such conflicting interests are resolved can depend on the degree to which one value is prioritized more or less than another.

> Bozeman (2007, p. 117) provides a nuanced and useful definition of value.
>
> A value is a complex and broad-based assessment of an object or set of objects (where the objects may be concrete, psychological, socially constructed, or a combination of all three) characterized by both cognitive and emotive elements, arrived at after some deliberation, and, because a value is part of the individual's definition of self, it is not easily changed and has the potential to elicit action.

Bozeman's definition serves to highlight some important aspects of values. Values extend beyond objective economic determination and include a subjective emotional component. The value of a family heirloom can far exceed the auction price because the item evokes memories of ancestors key to a sense of identity and belonging. Values are key to a deliberative process by which alternatives can be evaluated. There is a sense of thoughtfulness associated with determining value. The establishment of value requires deliberation. Values tend to change slowly, if at all, and therefore have a sense of endurance and consistency. Perhaps most importantly, values are a precursor to action. If the values of an individual or collective body can be discerned, it is possible to predict how they will respond to a given course of action. Those who hold strongly to certain values can be depended on to act in predictable and possibly beneficial ways.

Professions frequently seek to inculcate specific sets of values as a means of promulgating behavior that best serves their clients. Professions are granted jurisdiction to practice by society to the extent that they are perceived as beneficial and responsive to societal needs (Abbott 1988). Those professions viewed as using their specialized knowledge in a way that meets expectations tend to be granted additional jurisdiction. In other words, when they are trusted, professionals are given latitude to apply their specialized knowledge without interference. When professions fail to meet expectations, society responds by limiting or removing their jurisdiction to practice. Since the maintenance of freedom to practice is a key motivation for professionals, stewards of professions tend to emphasize statements of professional values intended to encourage behavior designed to increase public faith and confidence. Values are typically passed to members through oaths, creeds, and codes of conduct with the intention that they become part of an organizational culture or fundamental belief system. Adoption of a professional ethos is beneficial since it leads to a desire to behave in a way that exceeds the mere stipulation of laws, rules, and procedures. Socialized members of a profession will act in a specific way simply because that is how professionals are expected to act. The drive to be perceived as a professional along with an internalized sense of how professionals act in a given situation motivates behavior beyond that which can be achieved through job descriptions and supervisory oversight.

From the ideals of the enlightenment and its emphasis on the preservation of natural rights rather than obedience to the state emerged an American belief system that influenced the subsequent form and style of public management (Gawthrop 2009). Legitimate governance and administration were derived from the consent of the people, not from a sovereign designated by a higher power. The common good of the people was to be the overarching objective of government. To that end good management, public accountability, and adherence to the rule of law and democratic principles have served as foundational values for public officials and administrators. Some of these foundational values can be seen in the literature of public administration and have been codified in a variety of ways.

Public Administration scholar Dwight Waldo identified 12 ethical obligations of a public servant:

> The Constitution
> Law
> Nation or country
> Democracy

Organizational/bureaucratic norms
Profession and Professionalism
Family and friends
Self
Middle range collectives
Public interest/general welfare
Humanity or the world
Religion or God. (Waldo 1988, pp. 103–106)

Various perspectives combine to influence administrators' moral decision-making including individual's own sense of ethics, professional ethics, organizational norms, legal codes, and public interest values (Van Wart 1998). Conflict between virtues or values represented on such lists is evident with even a cursory examination. As an example, some degree of self-interest is necessary, rational, and virtuous, but public servants are expected to put the needs of the nation ahead of their own interests. Primacy of self-interest is a recipe for self-aggrandizement and corruption. Managing the tension requires some sense of order or hierarchy of values. Listed alone, any positive adjective is appealing, but some may be more effective or appropriate for establishing public legitimacy in a given situation than others.

Federal employees swear an as oath stipulated in public law 5 U.S.C. §3331:

I, [name], do solemnly swear (or affirm) that I will support and defend the Constitution of the United States against all enemies, foreign and domestic; that I will bear true faith and allegiance to the same; that I take this obligation freely, without any mental reservation or purpose of evasion; and that I will well and faithfully discharge the duties of the office on which I am about to enter. So help me God.

The oath taken by Federal civil servants serves as a promise to support the form of government established in the Constitution and the values contained therein. Individuals have a right to life, liberty, and the pursuit of justice, and the role of the government is to establish justice, insure domestic tranquility, provide for the common defense, promote the general welfare, and secure the blessings of liberty. The oath establishes organizational norms that are codified in public law (OPM 2015).

The American Society of Public Administration established a list of principles in 1981 that have evolved into a code of ethics. Within this code are a series of value statements that echo Waldo's obligations as well as earlier enlightenment ideals:

ASPA CODE OF ETHICS

The American Society for Public Administration (ASPA) advances the science, art, and practice of public administration. The Society affirms its responsibility to develop the spirit of responsible professionalism within its membership and to increase awareness and commitment to ethical principles and standards among all those who work in public service in all sectors. To this end, we, the members of the Society, commit ourselves to uphold the following principles:

1. **Advance the Public Interest**. Promote the interests of the public and put service to the public above service to oneself.
2. **Uphold the Constitution and the Law**. Respect and support government constitutions and laws, while seeking to improve laws and policies to promote the public good.
3. **Promote democratic participation**. Inform the public and encourage active engagement in governance. Be open, transparent and responsive, and respect and assist all persons in their dealings with public organizations.
4. **Strengthen social equity**. Treat all persons with fairness, justice, and equality and respect individual differences, rights, and freedoms. Promote affirmative action and other initiatives to reduce unfairness, injustice, and inequality in society.
5. **Fully Inform and Advise**. Provide accurate, honest, comprehensive, and timely information and advice to elected and appointed officials and governing board members, and to staff members in your organization.
6. **Demonstrate personal integrity**. Adhere to the highest standards of conduct to inspire public confidence and trust in public service.
7. **Promote Ethical Organizations**: Strive to attain the highest standards of ethics, stewardship, and public service in organizations that serve the public.
8. **Advance Professional Excellence**: Strengthen personal capabilities to act competently and ethically and encourage the professional development of others. (ASPA 2013)

The National Association of Schools of Public Affairs and Administration established accreditation standards promoting public service values. A focus on public service values in the academy, including measurement of the degree to which

students internalize them (NAASPA 2009), serves as a means of establishing and reinforcing beneficial attitudes, behaviors, and skills. The ASPA Code of Ethics represents an effort to establish professional and organizational norms that encourage members to advance the interests of the public. Values espoused by an organization or profession can differ from those in practice (Schein 2010). Beyond the lofty statements of codes of ethics are realities that shape the thinking and values of those who must face daily situational realities.

It is important to note that public service takes place in a bureaucratic structure with all of its attendant benefits and dysfunctions (Rohr 1989). Bureaucracies, with their clear lines of authority and emphasis on thorough documentation, tend to value standardization, predictability, and accountability in the provision of public services. Bureaucrats are public officials hired, retained, and promoted through a merit system. Bureaucrats, unlike elected officials, are assumed to be on a career status and with good behavior retain their positions independent of the election cycle. The establishment of a professional civil service was an effort to temper the partisan nature of political appointments of the time (Fredrickson 1972). Administrators were expected to remain subordinate to elected officials, but they were also expected to operate in a scientific and businesslike approach to administration independent of the more sordid aspects of partisan politics. Clear lines of authority and responsibility contribute to public accountability. No matter how large and complex the agency, someone at the top of the pyramid can be brought before elected officials to account for the actions of the organization.

Over time the dichotomy between politics and administration has largely been discarded by public administration scholars in favor of a perspective that acknowledges the pervasive nature of politics as inherent to the practice of public administration. An understanding of power and political systems are requisite for the effective implementation of public policy. Today public administrators are instead encouraged to appreciate the political nature of their work while avoiding overt partisanship. The values of rationality, respect for democratic processes, and meritorious service remain evident in contemporary public administration.

Our understanding of bureaucratic forms of organization has also evolved with the recognition that they can be prone to devolution into unresponsive, rule-bound institutions that are self-serving and protective of unproductive work. At its best, a professional ethos that puts the public good and general welfare over organizational and individual interests serves as a defense against some of the more pernicious aspects of bureaucracies. Public administration cannot escape the bureaucratic structure in which it practices, but public administrators can promote a professional worldview that prioritizes the interests of its client (society) as a counter to bureaucratic tendencies. Public administrators are expected to prioritize interests of the public over interests of the organization.

The notion of public service motivation suggests that some individuals may hold values that draw them to the public sector where their desire to serve and positively impact society can be fulfilled. The theory holds that employees will seek employment in organizations consistent with their own values. Public service provides an opportunity to make a broad and profound impact in a way that can be motivating for altruistic people (Wright 2001).

From a public policy standpoint appeals to widely shared values serve as a means of garnering support. In this sense, values are tools to be harnessed in an effort to organize and derive influence. Advocacy groups wrap favored solutions in the rhetoric of values such as freedom, equality, opportunity, security, and justice. Attempts to mobilize public sympathy and grass roots support are heightened with passionate appeals to values that have broad appeal. Much of the agenda-setting phase of the policy process is characterized by battles between competing advocacy groups to control the narrative and frame problems in ways that support favored solutions. As an example, groups advocating legal abortion describe themselves as "pro-choice," while those who oppose abortion describe their efforts as the "right to life" movement. Both are designed to produce

passionate moral reactions. Those who support additional gun regulation cite an "epidemic of gun violence" that begs a policy solution, while opponents of gun regulation appeal to the constitutional "right to bear arms." Value expressions evoke emotional responses and mobilize supporters who can often be identified based on the rhetoric they use. Shared values provide a pool of common interest around which people identify and distinguish themselves from others. Sometimes those groups organize into powerful constituencies that seek to influence public opinion and capture the support of decision makers.

At the heart of responsible public service is a shared sense of proper conduct based on underlying values that help motivate ethical behavior (Garofalo and Gueras 2007). Public administrators do operate within considerable legal constraints including a system of accountability to elected officials, yet they also exercise discretion in the execution of their duties in ways that have a positive or negative impact on society. The explication of key values such as the primacy of the public interest over private gain, lawfulness, and a sophisticated sense of obligation helps to establish expectations that public administrators can be held to and guideposts for honorable service for those who strive to act honorably in the execution of their appointed tasks.

# Ethical Values and Personal Integrity

James L. Cook
US Air Force Academy, Colorado Springs, CO, USA

## Synonyms

Integrity: character; Value: belief, principle

## Definition

Ethical values are beliefs that provide guidelines for acting rightly in specific roles or for living morally in general. Personal integrity is consistently sound moral character.

## Introduction

In addition to defining key terms, an account of ethical values and personal integrity must explain where ethical values can exist and where they originate; question whether values are ephemeral or enduring, and explain why some values endure while others do not; examine whether there is one greatest ethical value or if there are many values of equal importance; suggest how to resolve conflicts among ethical values; inquire whether values are relative or universal; clarify the relationship between ethical values and personal integrity; and point out obstacles to developing ethical values and personal integrity. This article sketches ways to approach each of these tasks by appealing to ancient and modern philosophy and moral psychology. The result is a general account applicable to the practice of public administration and policy making.

## Ethical Values: Definition and Kinds

Values are beliefs that provide guidelines for acting or living. Values help individuals or groups perform specific roles such as jobs to their satisfaction or live their lives in ways they find meaningful. Values may be variously expressed: as goals one should strive to achieve and sustain in various aspects of life, as principles that help choose and prioritize alternatives, or as rules that offer specific guidance for particular situations.

Not all values are ethical. Some, such as the Mafia's principle of *omertà*, often called the code of silence, facilitate criminal acts. By many standards *omertà* is an *un*ethical value, though a mafioso might disagree. Other values seem more practical or aesthetic than ethical. For example, a carpenter may value a well-organized workshop, a musician may strive for energy and precision while performing, an Olympic athlete may prize concentration and dedication to training, and a famous chef may value the attractive presentation of prepared food on the plate and table.

But some values are clearly ethical. They express what people strive to do and be in every aspect of life, professional and personal, not because of a payoff such as pleasure or fame but rather because of an obligation that is self-evidently moral. The musician, the athlete, the lawyer, and the stay-at-home parent all value honesty, for example, even though in each of these occupations it is often hard to tell the truth or shun an opportunity to cheat. The honest person recognizes no moral holiday in which the duty to tell the truth and play fairly is suspended; honesty as an ethical value is binding everywhere and all the time, no matter whether one is at home playing with the kids or in the office working with colleagues or at the supermarket shopping for groceries.

The division between ethical values and values that are practical or aesthetic is not absolute. A medical doctor must know her craft well not just as a matter of personal pride or workplace convention but more importantly because the business of preserving and restoring health is an ethical undertaking. So technical competence in medicine is both an ethical and practical value. "Neither a borrower nor a lender be," says Shakespeare's Lord Polonius to his son Laertes in the course of a mini-lecture on values (*Hamlet* 1.3.). The admonition serves as both a practical and an ethical value in a culture that believes it is morally necessary to live within one's means and to encourage others to do the same. In 1735 Benjamin Franklin advised his fellow Philadelphians that ". . .an Ounce of Prevention is worth a Pound of Cure. . ." when handling hot coals that could set their houses on fire. Foresight and initiative are certainly practical values, but they are also ethical values in so far as they help people avoid homelessness and the suffering it causes.

So much for defining ethical values and differentiating kinds of values; what remains unclear is their source and location.

## Who or What Can Have Ethical Values, and Where Do Values Come From?

Individual persons and collectives such as cultures, nations, churches, and service organizations have ethical values. Environment is their most obvious source (Wilson 2000). A person adopts the values of the people and institutions surrounding her, often without questioning why the values exist and whether they are worth the effort it takes to live up to them. For most people, socialization starts with family and friends who impart their own values in the course of everyday life. The process continues in the earliest years of schooling. Robert Fulghum's bestselling book *All I Really Need to Know I Learned in Kindergarten* (1986) celebrates ethical values introduced in early childhood. By Fulghum's homespun account, these earliest lessons exercise lifelong power. An individual person's particular culture, often associated with nationality, contributes further values. The United States' Declaration of Independence holds up "life, liberty, and the pursuit of happiness" as ethical values (though it calls them "Rights"). Subcultures such as religious confession and institutions likewise offer ethical values. San Francisco's GLIDE Memorial United Methodist Church values being "Radically Inclusive…We welcome everyone." Later in a person's life the work place introduces values of its own. For example, Bob MacDonald, a past CEO of the US corporation Procter and Gamble, proudly listed the corporation's values as leadership, ownership, integrity, passion for winning, and trust (MacDonald 2008). Similarly, each of the military services in the United States has core values. The three core values of the US Air Force, for example, are: "Integrity first. Service before self. Excellence in all we do."

Although it is relatively easy to identify possible sources of values, how they are adopted into individual and collective lives is somewhat mysterious. Similarly, it is difficult to say why some individual and collective values fall by the wayside while other values seem to last a lifetime in individuals and persist in perpetuity as group values. For instance, Judaism and its values have endured for about 4000 years and counting. What explains why some values, individual and collective, are stable while others are not?

## How Stable Are Values, and What Makes Them Stick?

As discussed above, most people encounter and adopt ethical values as they grow up. The process is osmotic: Human sources such as parents and cultural influences such as religion impart values, sometimes explicitly and sometimes more subtly, but rarely ask the recipient to understand completely the reasoning behind the values. Sometimes interrogation of values is even actively discouraged, as when an exhausted parent may answer the persistent "Why?" with "Because I said so" or a religion urges adherents "to trust and obey," as an old Christian hymn has it.

But at some point in their lives many people begin to interrogate some or all of their values. "For the human being, the unexamined life is not worth living" (Plato 1966, *Apology* 38a). So said Plato, urging his young followers to question the values they had inherited from their parents, religion, the city-state of Athens, and other sources. Scrutinizing life can be difficult and disorienting. After discarding values found to be wanting, a person may feel untethered and directionless. This is small wonder, because gaining a deep new understanding of long-held values may oblige one to do uncomfortable things. Mark Twain's Huck Finn exemplifies this sort of disorientation and discomfort after pondering the ubiquitous racist values of his society. Adrift on the Mississippi River, Huck struggles to decide whether he should go with the flow and turn in runaway slave Jim for a monetary reward and social approbation. Or should he discard those old values and instead help Jim achieve freedom? Doing the right thing will cost Huck dearly even if it also has its benefits. For Huck and everyone else, values still standing after facing an ethical quandary and those values newly forged in response to the moral challenge will impact life more powerfully than values that are simply inherited and accepted unthinkingly.

## One Value or Many?

The Boy Scout Law lists twelve values, including trustworthiness and loyalty, and exemplifies the multiplicity of ethical values that individuals and collectives may choose to embrace. Organizations such as Procter and Gamble and the US military services likewise set a number of standards for their members to meet. At the same time, however, institutions often tend to identify one big thing that they hope to achieve. Procter and Gamble's five values serve the corporation's overall stated purpose: "to improve the lives of the world's consumers" (MacDonald 2008). The US Air Force's three core values serve its single mission: "To fly, fight, and win in air, space, and cyberspace." A centuries-old tradition holds that the Old Testament contains 613 commands, including many recognizable as ethical values – e.g., "Thou shalt not kill." But the story goes that when a pagan challenged him to stand on one foot and explain everything a Jew is obliged to do, Rabbi Hillel replied "What is hateful to you, do not to your neighbor. That is the whole Torah [the entirety of the law]; the rest is commentary. Go and study."

These examples may prompt the inquisitive to ask: Is there one ethical value, or are there many? Is there one value that is good in itself, so that all other values are instrumental to reaching it? Aristotle describes numerous virtues that might also be called values, among them the so-called cardinal virtues of wisdom, justice, courage, and temperance. Yet he also insists that "the Good is That at which all things aim" (Aristotle 1934, *Nicomachaean Ethics*, 1094a). For Aristotle, the one good thing for the individual turns out to be a flourishing spirit, and analogous well-being is the single greatest good for the city-state.

The problem of whether there are many values or just one may not be soluble, or it may be that a linguistic approach is needed. Perhaps the term "value" is used in different ways such that it makes perfect sense to call Procter and Gamble's five aspirational guidelines "values" in one sense and its overall aim a "value" in a different sense. The five values are *instrumental*, while the single value believed to be most important is *ultimate*. This distinction is not just academic; it is helpful in reacting when values collide.

## Resolving Conflict Among Values

Perhaps there is just one ultimate value in human life, but people tend to speak of multiple values. This sets the stage for values to come into conflict with one another in certain situations. For instance, imagine a patient admitted to the hospital because of poor blood flow. Doctors might consider performing an invasive procedure to restore health – to remove a blockage in an artery by inserting a balloon catheter, say, or implanting stents. However, before beginning the doctors will ask themselves if there are any possible downsides to these procedures. Perhaps the patient is old and frail enough that statistically speaking he probably would not survive any operation. Or maybe the patient had not previously consulted a physician, meaning the doctors can try several noninvasive therapies such as administering oral blood thinners before considering resort to surgery. These noninvasive measures might improve the patient's quality of life even if they fail to get at the root problem of clogged or weak-walled arteries.

In this situation two longstanding values of the medical profession are in tension. On the one hand, there is the value summarized by the old saying "First, do no harm" (often given by the Latin *Primum non nocere*). This rule expresses what ethicists sometimes call the principle or value of nonmaleficence, that is, of not doing harm. On the other hand, doctors prefer to solve problems rather than just treat symptoms; they hope to restore optimal health whenever possible. In the case of the patient described, however, it makes no sense to seek optimal health if doing so would likely kill him. Some ethicists generalize from situations like this and say that *prima facie* – at first appearance – the duty of nonmaleficence trumps the duty of benevolence (Ross 1930). In other words, absent overriding reasons to solve a medical problem directly and completely when doing so would likely harm the patient, the doctor will choose to do no harm and seek other means of

alleviating symptoms. Sometimes there are overriding reasons to risk harm – e.g., when a living will expresses a patient's desire not to live dependent on life-support equipment.

But how does one decide which value trumps which in case they conflict? The most obvious way to decide is by using the distinction made in the previous section between instrumental and ultimate values. The first step is to examine each of the conflicting values. What is each supposed to do? Is it an end in itself or does it serve some higher good, that is, the ultimate value (whatever that might be)? It appears that at least for a practicing physician, neither the value of beneficence nor the value of nonmaleficence is ultimate; each serves the higher goal of the patient's well-being. The rule "First do no harm," a special instance of the broader principle of nonmaleficence, expressed the conviction of medical doctors that the ultimate goal of the patient's well-being, the value both the two competing principles of beneficence and nonmaleficence serve, is best achieved by first doing no harm.

While much more would need to be said before one had anything like a foolproof decision algorithm, this example points to one way conflicts between competing values might be resolved. However, there is no guarantee that it will always be clear which of two competing values would best serve the ultimate value in any particular context. Isaiah Berlin perceives the ethical values of liberty and equality as being in perpetual conflict. He labors not to show how the conflict can be resolved but rather to explain why the conflict is unresolvable (Berlin 1958). Even if Berlin is right, at least some serious conflicts can be resolved when one is clear about the distinction between instrumental and ultimate values. The example of the heart patient, above, demonstrates that fact at the level of the individual person. At a political level, Dame Stella Rimington, author and former Director General of MI5, the British internal security service, assures her audience that although democracy and security are two important political values that can conflict, shrewd leadership can ensure both aspirations are met (Rimington 1994).

Whether Rimington is right or not, Berlin makes it easy to imagine cases where instrumental values conflict and where there is no simple way to decide which value trumps based on appeal to an ultimate value. In such instances, people of high integrity might fail to live up to one or more of their values simply because they are unsure what to do; they transgress while trying to comprehend their duty. But at other times people know what their ethical values demand of them and yet still fail to meet the standard. The obvious question is, Why? Moral psychologists are increasingly interested in this question, and their research reveals that environmental factors can overwhelm even strongly held ethical values (Ariely 2010; Doris 2005; Haidt 2012). When under time pressure, for example, habitually kind people who would otherwise take time to help a stranger may rush by even the neediest of their fellow human beings.

## Are Values Objective or Relative?

It is fair to characterize a value as a belief that someone holds strongly. But beliefs may be true or false, and individual people have different, sometimes conflicting beliefs. Is it possible to know who is right when beliefs differ? A related question: Can values be objectively good or bad, that is, good or bad for all people, all the time? These questions get at a more general doctrine that ethicists sometimes call *relativism*. There are different kinds of relativism, but a common form holds that no value is objectively right or wrong because there is no universal standard that could serve as arbitrator. This contention seems most palatable when applied to norms, personal or cultural, that do not involve physical harm. For instance, one person may believe strongly that it is morally corrosive to see nudity in public – at topless beaches, say – while another person believes just as strongly that so-called body taboos are nothing but culturally instilled prejudices. The ethical issues at stake here are not unimportant, but they pale in comparison with other differences in intercultural practice. An example is the female genital mutilation widely practiced in parts of Africa and the Middle East. A thoroughgoing cultural relativist would say

such mutilation is neither right nor wrong in any objective sense, and in fact the very term mutilation expresses no universal moral truth but rather just one among many possible perspectives. Others would find this attitude appalling and argue that gratuitously injuring a child is always wrong. This example helps make clear why the question above – Can a value be universally true? – matters so much.

Knowing what ethical values are and how they function in the lives of individuals and groups provides a good basis for understanding the second concept in this entry's title, namely, personal integrity.

## Personal Integrity: Definition

Integrity manifests itself in consistently good action. The Latin *integritas*, the root of the word integrity, means among other things wholeness, consistency, and uniformity; similarly, in math the word integer means a whole number. But often integrity is used to mean not just wholeness or consistency, which a person could demonstrate by being wholly or consistently bad, but complete and constant good character. When integrity is understood in this way, the phrase "has integrity" is just another way of saying, "is a good person." Even in Latin, that which has *integritas* is often not just whole but also sound.

Here one may be tempted to question how strong the link between wholeness and soundness – moral soundness, that is – must be. Suppose there is someone who acts in a way that is consistent with his or her values, yet moral intuition suggests this person is unethical? Perhaps it is possible for good and bad people to be equally consistent, that is, have equivalent integrity in the sense of wholeness.

To make this possibility concrete, suppose Heinrich is an SS officer who, though not foolhardy, rushes into the hottest spots of every battle where angels would fear to tread. Does Heinrich therefore have the cardinal virtue of courage? To answer, it may help to imagine Joe, a lieutenant in the US Army a few hundred yards on the other side of the front lines from Heinrich. Joe acts courageously too, though he serves a very different cause.

Is Joe's courage of a different sort than Heinrich's? Or are both men equally courageous? Here moral intuition may bog down in paradox and fail to give a satisfactory answer or even any answer at all. Taking this case to its logical extreme would yield not just a continental divide of values in a single person, with good values at home and horrific values at work, but a wholly bad person – a person of integrity (wholeness), yet the very worst kind of person. This is worth exploration.

## Can a Bad Person Have Integrity?

Since at least the fourth century BC courage has been considered one of the four cardinal virtues, along with wisdom, justice, and temperance. So if one decides Heinrich and Joe are equally courageous, then it follows that Heinrich, bad actor though he is in every other aspect of life, has at least one virtue. His values are not totally corrupt. And yet Heinrich would do less harm if he were *not* courageous, so we have a paradox that courage, a virtue, facilitates wickedness. Does this make sense? Does it make sense that having a virtue, or one could also say the right ethical value in an aspect of life, can actually be a bad thing? Is there a way out of the apparent paradox?

One way out would be to argue that in fact Heinrich is not courageous; he only appears to be so. How could that be? Since at least the fourth century BC the West has entertained the possibility that virtues have a cognitive component: to have the virtue of courage, for example, means to *know* something about the aspects of life where courage is at stake. Not that all virtues are primarily acquired by learning. Aristotle thought only some were; others, including courage, were gained largely by practice. Yet even these practice-heavy virtues required particular knowledge. Plato, Aristotle's teacher, has Socrates and interlocutors agreeing that courage is knowing what one should fear and what one should not fear (Plato 1969, *Republic* IV 442c). So, for example, a foot soldier defending one end of a bridge

realizes that unless she flees from the advancing enemy, she will be killed. On the other hand, she knows that if she fails to delay the enemy, her homeland will be overrun and her family and friends killed and enslaved. Which outcome should one fear – guilt-ridden survival in a world without family and friends or one's own death? Following Plato, it appears the courageous person knows that of the two alternatives, death is not the frightening one.

Arguably all the virtues similarly require knowledge. For example, one must know what it means to live moderately before one can do so. How much fat is too much and how little is too little in a daily diet? What about carbohydrates, and does it matter whether they are simple or complex? Humans are not born knowing the answers to these questions. Shelves and shelves of nutritional studies and how-to diet books attempt to provide answers. One must have an inkling of these answers in order to live temperately, that is, with the right ethical value of moderation. The same is true of the cardinal virtue justice. In the US over the last few years, the Supreme Court's nine members have often split five to four on the most important legal issues. Deep knowledge is necessary to discover and do the just thing.

Stipulating for the moment that all virtues require extensive knowledge, how much overlap is there among the respective kinds of knowledge that each virtue presupposes? For example, how much overlap is there in the kind of knowledge one must have in order to be temperate with the kind of knowledge one must have to be just? Presumably the overlap could be substantial. Consider the question of whether the US government may require a citizen to purchase health insurance if she earns sufficient money to do so. This amounts to a question not just of justice but as well of moderation: How much should a government interfere with personal decisions on what to buy? Is requiring the purchase of health insurance too intrusive, or would the government be negligent if it did not insist that citizens who earn enough buy health insurance? In 2014, the US Supreme Court found for the Obama administration in a challenge to the Affordable Care Act, *King v. Burwell*.

Perhaps the epistemic overlap is significant enough that anyone having one virtue will have them all. Perhaps Heinrich's supposed courage amounts to mere recklessness. As a committed Nazi he serves an unjust cause, after all, and so apparently does not know what is worth fearing and what is not. Lacking that knowledge, he necessarily also lacks courage. How could someone not fear a thousand-year Reich in which Jews, Roma, Sinti, gays, lesbians, and others had been systematically eliminated? And yet that is the end state that Heinrich's courage serves.

But does Heinrich have personal integrity? He is, after all, a thoroughly committed Nazi; he is consistent in his beliefs and actions. One can reasonably answer yes or no. Yes, Heinrich exemplifies integrity-as-personal-consistency, but no, he fails to demonstrate integrity as having the whole set of ethical values that make for the life most worth living.

## Developing Ethical Values and Personal Integrity

It is perhaps most natural to think that to remedy a dearth of ethical values and personal integrity in any walk of life, including public administration and public policy making, those who teach aspiring practitioners ethics must optimize their methods. But before asking *how*, exactly, one could improve the teaching of ethics, it makes sense to ask *whether* ethics can be taught at all. Once again, ancient Greek philosophy recognized the problem. Plato's dialogue *Meno* begins with a challenge to Socrates: "Can you tell me, Socrates, whether virtue can be taught, or is acquired by practice, not teaching? Or if neither by practice nor by learning, whether it comes to mankind by nature or in some other way?" (Plato 1967, *Meno* 70a). Arguably these questions are never answered once and for all either in the dialogue or even in all of Western philosophy since. But *Meno*'s questions are critical to the issue of how to ensure tomorrow's public administrators and policy makers have the right ethical values and personal integrity.

Arguably, ethics training has placed too much emphasis on developing the individual leader's character and too little on training leaders to seek out, build, and maintain ethically healthy environments. Moral psychologists are amassing increasing empirical evidence that character, no matter how ethical, can ward off environmental temptations to err for only so long and to only a limited degree (Ariely 2010; Doris 2005; Haidt 2012, 2014). To overstate this thesis a bit: put a saint in a scofflaw motorcycle gang, and before long he will be just another biker. There might be some rare individuals whose character is truly impervious to the seductions of perverse environments. But most people are not that morally tough. Most can act consistently well only when they are in environments that help them do so. Although moral psychology is now contributing more evidence of this, the basic insight is quite old. "Be careful to choose the right friends and associates": that is venerable advice that is based on the same sense of human frailty. Good people can go wrong if they are in the wrong company, or more broadly, the wrong moral environment.

So of course we should try to gird each future public administrator or policy maker with the best possible character, but that is not sufficient. Just as important is to teach a preventive mindset that will encourage the individual to shun corrupt environments, including associates, and instead choose salutary ones. The corresponding obligation on the part of leaders in public administration and policy making is to create and maintain healthy ethical climates, ones where otherwise good people are not tempted to transgress beyond their powers of moral resistance. As universities and on-the-job training teach young people the nuts and bolts of administration and governance, it is crucial that another lesson be imparted as well – leaders of communities and organizations must be moral architects who build and maintain environments conducive to ethical behavior.

## Conclusion

Scholars of ethical values and personal integrity differ on important questions. Monists argue with pluralists over the question of how many values there are. Moral relativists and absolutists wrestle over the question of whether there can be universally valid ethical values. And on and on the scholarly disagreements go. Even the general approach taken in this entry – of developing a general theoretical account of values and integrity for application to specific practical issues – would strike some as questionable (Capaldi 1996). But none of these disputes undercuts an important point of consensus: In the day-to-day practice of public administration and policy making, ethical values and personal integrity are critical cornerstones. Neither individuals nor organizations can achieve long-term success without them.

# Ethics and Accountability

Saeed Siyal
School of Economics and Management, Beijing University of Chemical Technology, Beijing, People's Republic of China

## Synonyms

Beliefs and answerability; Morals and responsibility

## Definition

Ethics refer to the principles, standards, or codes which govern the behavior of individuals. Those failing to comply with such standards are held accountable for their acts and behaviors.

Accountability refers to the assurance of evaluating an individual or organization based on the performance and behavior in terms of their responsibilities.

## Ethics

Ethics is an essence of professionalism as well as efficiency at the workplace. They represent the character and standards that lead to behaviors and activities of individuals. According to Davis (1990), ethics are the morally accepted standards of behaviors and actions desired by every member of a group or organization in other fellows. It is also defined as a just or right moral of the behaviors among parties (Runes 1964), something constituting good or bad conduct of the individuals (Barry 1979), as a criterion to differentiate between good and bad, right and wrong and something that aware us about what we should do and should not do (Beauchamp and Bowie 1983). It may also be referred as a sound culture which is based on a set of values including efficacy, professional discipline, self-esteem, fairness, and gentility in performing the duties. Ethics has always influence on the individuals, organization, as well as society, and relate to the codes of conduct which are regarded as right and virtuous. They have impact on the ethical judgments made by the individuals having the legal and moral acceptance by the community (Jones 1991). Hence, the societal ethics can be observed in a form which controls the behaviors and actions of members of the society (Bauman 1993).

In the literature of business and management, ethics is commonly studied by the use of normative theories emphasizing on what the individuals should behave and not. These theories determine the nature of action or behavior whether it is right or wrong and its impact on others (Tsalikis and Fritsche 1989). Moreover, ethics claims a legitimacy which is quite powerful and limits the behaviors and actions of individuals and holds them accountable for their doings (O'Reilly et al. 2009, 246). Corporate codes for ethics have been

proliferated and proved expedient for notifying the individual employees regarding the organization's legal requirements, addressing concerns, as well as serving as a guideline for the accepted practices within organizations. Any organization is held ethical by the people who owe, manage, and work in it (DeGeorge 1999). Hence, the excellence of the organizations may not be identical to their ethical morality but it is always encouraged by it. Thus, the understanding of dynamics regarding the ethical decision making can be useful for the organizations in creating ethical work environment by selecting certain tools and training for their leaders and employees. Without the ethical standards, the leaders may behave harshly with their subordinates and leave adverse impression on employees and subordinates which in turn may lead them to switch the organization (Siyal 2018; Siyal and Peng 2018). This may affect the organizational performance and lead them towards hard times and prone to the downsizing as well (Siyal 2020).

Ethics is stranded on wide-ranging doctrines of integrity and fairness which focus on the matters of core stakeholders like the quality of products, benefit of workers, and satisfaction of customers and ecological responsibilities of the local community. In the contemporary past, organizations have raised accountability in terms of ethics which make employees follow the highest caliber regarding ethics. Professionals are known for their competence along ethical standards, without which their competence is of no use. Failure in ethics may lose the trust of employees and public. This results from the rising pressure on organizations for being trustworthy as well as accountable which leads to embrace and include the code of ethics in organizational decision making. Accountability is an effective mechanism to control the conduct and behaviors of individuals and employees within societies and organizations respectively (Siyal and Xin 2020). This connects the business ethics and accountability to determine the way individuals react to the dilemmas of ethics. Ethics appear in diverse classifications, out of which the most common classification is normative which comes in main three forms. Brief description of each form is given below.

### Utilitarian Ethics

The best approach of understanding this form of ethics is by identifying the situation being addressed which commonly relates to criminal justice and penalties based on retribution. Retribution or payback is determinedly rooted in the human emotions, which often led to the desire of punishment and penalty (Hooker 1996). This was later recommended by Jeremy Bentham to keep aside the emotional or religious perspective and consider the social perspective while justifying and addressing any situation. After this, the policies were eventually designed to raise the welfare of the society and organizations overall. Hence, the criminal acts within the society or organizations were meant to discourage the crime, and not prone the doers suffer hard. In fact, the pain or agony of the criminals counts contrary to the punishment or penalty and should be balanced by the greater evil or bad which is probable to occur if left unpunished or scot-free. The ethical philosophy underlying this approach is utilitarianism that supports the idea of trying for good for greater number without any disruption due to retribution.

### Deontological Ethics

The term deontology has a literal meaning as a science of duty, whereas in terms of ethics it bears a meaning which is more specific and comprehensive. It represents the idea of existence of good and bad in the intentions of individuals, not in the consequences of their acts because the actions are the reflection of intentions of any individual. An individual often acts in accordance with the intentions. The deontological perspective of the good intentions is not always colloquial, for instance, a manager or leader intending to visit his team working at the site or field, but he never does what he has been intending. This person can be regarded as the one having good intentions, but in the ethical sense he did not intend to visit his team working at the site because if he really intended, he would have visited them. In the ethical concept, intending any act infers to do it, unless it has been thwarted or failed.

The deontological investigation and exploration of what transforms the intentions into good is

actually the Kantian analysis proposed by the Immanuel Kant (1788, 1969). He starts with the proposition that an individual always acts for a specific reason behind it. There must be some reasons for that act or behavior. For example, if an employee quits a job, he must have some reasons for doing this. May be his boss is not fair with him, maybe he is not being promoted for a long time or the other employer is offering him better position with better salary and benefits. Or if a boss is strict with any specific employee or subordinate of his team, there may also be several reasons behind it. The employee may not be performing well, or he may not be punctual, active, or team player, etc.

### Aristotelian Ethics

This form of ethics has a tendency of being misunderstood or sometimes precluded by the descendants of western culture due to lacking the moral obligation. Aristotle's ethics illustrates the way to live a good life regardless of its place whether it is an organization or a society. In his point of view, the goodness or badness of a human life is same as the tools are good or bad. He further explained that a good tool usually functions in a good manner and it is sharp, balanced, durable, and safe in handling. Consistently, a good individual is that who performs well in all aspects including the ethics in any organization or society.

All the three forms of ethics are the fundamental classifications which describe all the aspects of ethics no matter they are related to any organization or society or as an individual. These are believed to be the complete codes of ethics which have been designed decades ago but are still valid and operational in all fields, societies, and cultures at all levels. Employees or individuals failing to act or behave in accordance with the set principles and morals are held accountable for their behaviors and decisions; this proves a close relationship of ethics and accountability.

## Accountability

The relative aspect of ethics suggests the effect of accountability on it. Accountability represents the perception to defend and justify the conduct and behavior to the audience (employees or individuals) having rewards and sanctioning of the authorities, which are subject to the evaluation by the employees and individuals (Buckley et al. 2001; Tetlock 1992; Beu and Buckley 2001). Thus, leaders and individuals are accountable for their act and behavior at the workplace or society, as the schools, organizations, and institutions jointly form social systems having communal expectations and ethics and held the members accountable for their acts and behaviors (Frink and Klimoski 1998). Hence, accountability is based on certain rules and regulations (Mitchell and Scott 1990), the way of evaluation of their acts and behaviors (Mitchell 1993), approaches of control in the social setups, and the expectations predefined (Ferris and Judge 1991). The rules, regulations, and mechanisms of accountability may differ from organization to organization and society to society but the evaluations are almost same at the organizational and society level.

Accountability refers to the human behavior which is a multifaceted phenomenon and not all the individuals behave alike when held accountable for the same situations. Accountability has been well described from the lens of agency theory which supports the concept of accountability and argues that the utility and effectiveness of individuals depend on the level of essential enacted restrictions that hold them accountable (Jensen and Meckling 1976). The individuals and employees who have certain constraints which stop them from the actions and behaviors having the possibility of making them accountable are less liable to get involved in such behaviors and actions against ethics. While the individuals and employees who are not bound with such restrictions may get involved in such behaviors and acts which might be against the ethics of any society or organization. Moreover, organizational control theory illustrates that the employees and individuals get rewards and authorization by comparing their performance to the set standards (Ferris et al. 1995). The organization rewards and promotes its employees by their accountability and comparison of performance.

Employees performing in line with the established morals of the organization easily get rewards and sanctions to some extent at the time of accountability and performance evaluation.

The mechanism of accountability varies in different situations based on the behaviors of individuals. A common and widely used framework is recommended by Tetlock and his colleagues which discusses three different situations (Lerner and Tetlock 1999; Tetlock et al. 1989). The first situation states that when the views of individuals are acknowledged before making opinion, it becomes easier to form the strategy to cope with the actual situation. Evidently, the idea of getting opinion from the employees and individuals shifts the focus of decision makers from the prospective effectiveness of consequences to the justifiability. When the decision makers are aware of the opinions of employees at workplaces or individuals in society, it helps them to give a decision regarding the situation. The second situation refers to the state of being unaware of the views of individuals before figuring out their opinion. In this situation, the individuals usually get involved in anticipatory self-criticism. They often perceive in a more self-critical and interactively multifaceted means and consider diverse viewpoints regarding the issues and endeavor for anticipating the possible raised doubts and objections against their positions and authorities. Though, this is not the situation in which the individuals may possibly guess the opinions of their audience. The third situation relates to the people who are irreversibly devoted to the decisions and learning the prerequisite for justifying their actions after the process of decision making. Hence, this situation is also known as the post-decisional accountability. Hence, it provokes the cognitive endeavors focusing on self-justification rather than the self-criticism. It is considered as defensive strengthening which tends people to emphasize intellectual energy on justifying their past actions and behaviors. Thus, it is specifically true in the situations when the individuals are held accountable for the outcomes of decisions. This is an effective framework for accountability which covers all the three main situations in which the individuals and employees are likely to be held accountable. It is useful for the decision makers to take effective decisions by following this framework.

However, ethics and accountability are interconnected which makes it necessary to put them in a correlated perspective in order to increase the understanding of both. Additionally, both are the fulcrums of this chapter. Any variation in one leads towards another. If an employee performs beyond the established ethics, he is liable to be held accountable for that. Accountability is delineated into several forms on the basis of three main dimensions. The first refers to the main reason for these dimension and highlights the difference between links of accountability source (i.e., principal, manager, or accountability holder) which may be internal or external and the individual who is being held accountable under any situation (Gormley and Balla 2004). Secondly, the degree of control exercised by the principals or managers over the power holders. This dimension indicates the extent to which the accountable individuals are held and face pressure of their principal or seniors for their acts and behaviors against a certain established set of ethics. The third and critical dimension of accountability is regarding the directions of relations of accountability which may be upward, downward, or vertical and horizontal. For example, when the shareholders hold the business executives accountable for the performance of company, this falls under the upward-vertical dimension. When the bureaucrats and their leaders are held accountable by the politicians to get their decisions implemented, this relationship falls vertically downward. Furthermore, these three dimensions categorize the accountability into main 12 forms (Lindberg 2013).

1. Business accountability, in which the shareholders hold executives accountable in terms of profits and other financial concerns occurring in the business.
2. Bureaucratic accountability where the accountability proceeds from top to bottom internally. The top principals hold their juniors accountable for their actions and behaviors.
3. Audit accountability, in which an internal or sometimes external principal holds other

offices or office holders of the same organization accountable usually in terms of financial matters and prudence.

4. Client-patron accountability, where a client holds patron accountable for delivering the previously promised benefits.
5. Patron-client accountability, in this form of accountability, the patrons hold their clients accountable for the variety of benefits given that what can be offered to the clients is importantly adequate. It may be in the form of material benefits such as rewards or nonmaterial as safety, career opportunities, and status, etc.
6. Peer accountability, in which executives (formally or informally) hold other executives of the same level accountable. This occurs horizontally at the same level among the colleagues.
7. Representational accountability occurs when the citizens hold their elected politicians accountable for several concerns which were promised before the time of elections.
8. Fiscal accountability, where the external principal or executive holds several ministries and departments as well as agencies accountable concerning the financial matters.
9. Legal accountability, this form resembles with the fiscal accountability in terms of action. In the legal accountability, the judicial institutions and judiciaries as an external principal hold citizens, businesses, as well as politicians accountable for unlawful acts and behavior. When the citizens, institutions, or politicians are held accountable, they are likely to face the hearings in constitutional or supreme courts.
10. Societal accountability, which refers to the actions of civil society and media in order to force the decision makers of politics, bureaucracy, business, and legal areas for providing information and justification for their decisions and actions. The main focus of this form of accountability is to get information and justifications against the decisions made by politicians, bureaucrats, business persons, and legal experts.
11. Political accountability, in which the politicians are held accountable by the public for their political representiveness, credibility, and competence.
12. Reputational accountability is observed horizontally between the peers and peer organizations which are peripheral to the agent. In this form of accountability, the reputation of agents is damaged while acting contrary to the already established standards and processes.

## Conclusion

Ethics and accountability are the essence of any organization and society which control the behavior and acts of employees and individuals. The main forms of ethics and accountability have been discussed in detail which are commonly used to address all the issues in ethics and accountability.

# Ethics and Accountability Crises in Nigeria Public Administration

Ogbewere Bankole Ijewereme
Department of Political Science and Public Admin., Faculty of Business and Social Sciences, Adeleke University, Ede, Nigeria

## Synonyms

Answerability; Bureaucracy; Civil service; Government; Integrity; Public service

## Definitions

**Public administration crisis**: The term refers to unethical practices, lack of accountability, and corruption that severely impair the capability to formulate and implement a state's policies.

## Introduction

The commitment of any nation to development aspiration is often determined by the extent of adherence to the principle of ethics and accountability in service delivery. Ethics means moral codes of conduct, while accountability implies answerability or responsibility and being liable for one's conduct/action or inaction. Ethics, accountability, transparency, and trust among others are interrelated values that inform the nomenclature for public administration (Lyrio et al. 2018). These values serve as solid foundation of governmental activities, including prescriptions for high standards of behavior in formulating and implementing sound policies. In Nigeria, the institutional mechanisms for controlling public administration crisis are either weak or disregarded, and nepotism often overrules institutional laws, etc.

For some of the Nigeria, notwithstanding robust knowledge on public administration issues, many of the less visible causes of public

administration crisis are often lost in the explanation dominated by bribery. Thus far, there is a dearth of theoretical and empirical analysis of the causes of public administration crisis on the African continent (Cucciniello et al. 2017), especially in Nigeria. To bridge this gap, this entry explores the causes of ethics and accountability crises in Federal Public Administration of Nigeria.

## The Crises of Public Administration in Nigeria

Since Nigeria independence, the Nigeria public administration such as the Civil Service, Parastatals, and Agencies also known as: Ministries, Departments and Agencies (MDAs) which constitutes the machinery through which the government implements its policies and programs has witnessed worrisome ethics and accountability crises with little or no concrete efforts to transform public bureaucracy. The Allison Ayida Civil Service Review Panel of 1994 itemized the key crises of the service as:

(i) Lack of financial accountability and probity
(ii) Complete institutionalization of corruption at every section of the service
(iii) Disregard for rules and regulations
(iv) Loss of direction
(v) A general deterioration of effectiveness and efficiency

In a bid to provide solution to these ills, President Olusegun Obasanjo in 1999 unveiled his vision of an ideal public administration among the following elements:

(i) A knowledgeable, expert, development-oriented, public-spirited and customer-friendly, accountable, and ethically transparent public administration capable of responding effectively and efficiently to the welfares of the society.
(ii) A civil service where impartiality, integrity, loyalty are core values and whose operations are guided by equity, where things are done in the right way based on extant rules and regulations but with room for discretion, which should be exercised in the public interest.
(iii) A public service with an appropriate environment where civil servants are assured of protection and job security in the faithful discharge of their responsibilities, etc.

The unfolded ideal public service inspired President Obasanjo's administration to undertake far-reaching reorganizations in the areas of downsizing, privatization, deregulation, and outsourcing public service. Obasanjo likewise introduced the Due Process Office in 1999 and consolidated it with the legislation of the Bureau of Public Service Reforms in 2003 to promote the values of competitive open contract bidding and accountability.

Besides, President Obasanjo signed the enabling laws establishing the anti-corruption agencies' bills which comprises Economic and Financial Crimes Commission (EFCC), the Independent Corrupt Practices and other related offenses Commission (ICPC) among others to address the issue of corruption. In spite of these measures and initiatives, Nigeria has consistently featured among the most corrupt countries in the world by successive years of corruption perception index of the transparency international.

Among the mindboggling revelation is the claim of Soludo (2015) that N30 trillion of Nigerian money was either stolen, misappropriated, embezzled, or unaccounted for during the 4 years of Goodluck Jonathan's government. Soludo further claims that the amount did not include the estimated N40.9 billion at parallel market exchange rate or nearly 2 years' Federal Government budget which the African Union's (AU) report claims to be stolen from Nigeria yearly under Jonathan administration. In contributing to the debate of corruption and lack of accountability, the former minister of finance, Okonjo-Iweala in 2018 reveals that the Jonathan government bribed the federal legislators with N17bn to pass 2015 budget (Okojo-Iweala 2018).

Furthermore, biometric audit' report in the era of Goodluck Jonathan exposes unprecedented

subsidy scam, looting in the Nigerian National Petroleum Corporation (NNPC), and 45,000 ghost staff in federal service who earned N100bn yearly (Ojoye 2016). More importantly, the inclusion of Police force into the "Integrated Payroll and Personnel Information System" reveals that 80,115 representing over 22% of the entire Nigeria Police Force were ghosts (Udo 2018). Nigeria federal government and ten states were said to loss over N538bn to thousands of ghost employees between 2013 and 2015 (Ojoye 2016). In addition, billions of Naira are lost monthly to salary fraudsters in many states and local governments who are yet to embrace employee biometric audit' policy. Payroll scam often go un-investigated unless there is a huge scandal that brings it to light.

An eminent social activist, Falana in contributing to public administration crises in current President Mohammadu Buhari administration stressed that the former NNPC Group Managing Director (GMD), Maikanti Baru, singlehandedly award of contracts within the amount of $25 billion and employments of crucial staff in the NNPC without the authorization of the Board of Directors was a violation of due process and NNPC Act. Not just did Baru fail to take cognizance of the provision of Sect. 6 (c) of the NNPC Act, which empowered only the Board of the NNPC with the absolute power to employ main employees – or venture into contracts – or collaborations with any firm – or people (Onanuga 2017), but also the presidency could not punish Baru or cancel the contracts and the unauthorized employments. Similarly, the provocative reinstatement and upgrade of a civil servant, Abdulrasheed Maina, who was declared wanted by EFCC for defrauding pension fund in the tune of billions of naira, represents nothing other than an unprecedented unethical practices by the Buhari administration who later dismissed him from the appointment after media bashing.

## Theories of Causes of Public Administration Crises in Nigeria

### Theory of Resource Curse

The theory presupposes that natural resource-rich countries tend to have lower economic growth, underperform in several development indicators because oil wealth as a free gift of nature predisposes oil-rich states' leaders to obsession for oil proceeds, oil-induced bribery, greediness, higher political violence, and poor governance with likelihood of despotism than non-resource rich nations (Ross 2014). Ross argues that since the 1960s, countries without mineral resources have outperformed and grown better than those with numerous mineral resources.

Since 2001, numerous studies have interrogated "political resource curse," as a contradiction that appears to be blessing but in reality has a high propensity to harm, dislocate, and retrogress governance system of oil-rich states (Ross, 2014). Ross claims that petroleum resource has a propensity to induce high greediness, bribing, and embezzlement in tyrannical regimes that help to trigger violent conflict in middle- and low-income countries as is being experienced in Nigeria.

Therefore, the study seeks to answer the research question seeking explanation for the very high prevalence of public administration crisis in Nigeria.

### Low Risk–High Benefit Theory

The theory is credited to Larry Diamond. Diamond stresses that the essense of punishment in any society is to bring about deterrence, but in a situation where the alternate is the case, a deteriorated ethos of impunity becomes ubiquitous. According to Ijewereme (2015), unethical practices in public administration grows best in an area where the peoples are of the belief that the risk of getting cut in corrupt act is low or practically not in existence or the punishment can be avoided or insignificant.

Ijewereme (2015) is of the opinion that the theory presupposes that "people who think of involving in unethical practices first consider the benefit and the danger." It is when they see the benefit outweighs the danger that they participate in unethical practices.

In Nigeria, most bureaucrats and political officeholders who corruptly acquired public fund can pay to secure the protection of courts, investigative panels and law enforcement officers, and even in the event of being sentenced they often

enter plea bargaining to be served with a very light punishment. However, the question to investigate empirically is: Does high benefits and low risk of involving in corruption contribute to administrative crisis in Nigerian public administration?

### Anomie Theory

Merton is one of the proponents of this theory. Merton argues that the social pressures which society exerts on some of its members particularly public servants is the cause of unethical behavior in the public sector (Ijewereme, 2015). This is because those members under the societal pressure are conditioned to enact deviant behaviors among which are unethical practices and lack of accountability.

In Nigeria, the society does not accept any reason as good enough for an employed graduate not living in affluence. Political officeholders, bureaucratic leaders, etc. have no acceptable reason to the society for not donating much money at launches, etc.

Therefore, the study set to find an answer to the research question which says: Does societal pressure on public servants contribute to the federal public administration crisis of Nigeria?

### Methodology

Primary and secondary data were utilized in the study. Primary data were collected by means of questionnaire administration. The researcher asked four thought provoking questions within the context of Nigeria that are considered parts of causes of public administration crisis, such as: Is Bribery/embezzlement one of the causes of unethical practices and lack of accountability in Nigeria public administration? Does greediness play a significant role in the federal public administration crises? Does societal financial pressure on public servants contribute to unethical behaviors and corrupt practices in federal public administration? Do you believe high benefits and low risk dimension of involving in corruption contributes to federal public administration crisis?

Purposive sampling technique was utilized to select four Federal ministries, namely: Ministries of Agriculture, Information and Orientation, Education, and Labour and Productivity in Federal Civil Service of Nigeria. The total study population consisted of Agriculture (350), Information and Orientation (252), Education (650), Labour and Productivity (270), totaling 2,422 respondents in all. Four hundred and eighty-four (484) senior staff (respondents) were selected using simple random sampling technique for questionnaire administration within sample fraction of 20. Out of the 484 questionnaires administered, 164 were retrieved from grades level 07–12 and 13–17. Secondary data were sourced through academic journals, relevant textbooks, newspapers, and internet source.

Questionnaire were administered on senior staff from grade level 07–16 in selected ministries in FCS of Nigeria. The researcher deplored his personal networks to negotiate access to the respondents. Data collected from the primary source were analyzed using descriptive statistics such as frequency distribution and simple percentages.

### Data Presentation and Analysis

This segment conveys a statistical analysis of the data described in the section on methodology with a view to diagnosing the causal factors to public administration crises across the selected ministries. Four variables were used to capture the factors responsible for public administration crises such as bribery and embezzlement, greediness, societal pressure on public servants, high benefits and low risk of involving in corruption.

In the case of bribery and embezzlement: 95 people representing 63.5% strongly agreed, 22 (14.8%) agreed, 27 (18.1%) and 4 (2.7%) disagreed and strongly disagreed, respectively, that bribery and embezzlement serve as one of the factors contributing to unethical practices and lack of accountability in Federal Public Administration of Nigeria. Greediness is another important variable tested. The result showed that 118 people representing 78.1% strongly agreed, 19 (12.6%) agreed, 13 (8.6%) and 1 (0.6%) disagreed and strongly disagreed, respectively, that greed is one of the causes of public sector crisis.

The respondents response on societal pressure as one of the variables responsible for administrative crisis indicated that 123 (81.5%) strongly agreed, 24 (15.9%) agreed, 3 (2.0%) and

1 (0.7%) disagreed and strongly disagreed, respectively.

In a similar vein, high benefit and low risk as causal factors for corruption and crisis of public administration showed that 125 respondents representing 83.9% strongly agreed, 5 respondents representing 1.4% agreed, 7 respondents representing 3.5% disagreed, and 2 representing 1.3% of the total numbers of respondents strongly disagreed (Table 1).

## Discussion

This section discusses federal public administration crisis within the context of its causative factors in Nigeria. From a critical evaluation of causal factors to public administration crises, the study discovers that there is a crisis of public administration in Nigeria partly because of bribery and embezzlement. This result corroborates the assumption of "resource curse theory," which stresses that natural resource-rich nations like Nigeria are stuck in resource curse emanating from bribery and embezzlement of oil proceeds by the political and bureaucratic leaders (Ross 2014).

Besides, the finding also demonstrates that there is public administration crisis in Nigeria mainly because Nigerian citizens believe that there is high-benefit and low-risk of involving in corruption. Not only is the finding validates low risk-high benefit theory on the believe by most citizens that the risk of being caught in corruption is low or almost nonexistence or the penalty is little or can even be avoided, it also account for why there is always no outrage against corruption in Nigeria.

Finding similarly indicates that one of the causes of public administration crisis is societal pressure on public/civil servants. This finding corroborates the assumption of anomie theory which argues that society exerts social pressures on some of its members (public servants) and this triggers public administration crises. The study likewise reveals that greediness remains a major factor responsible for public administration crisis, and this corroborates the assumption of resource curse theory.

## Concluding Remarks

The analysis demonstrates the preeminence of perceptions of the causal factors to public administration crises in Nigeria. Although, corruption-induced public administration crisis is a global phenomenon, it has immense implications not only in Nigeria but also has a spillover effects on foreign countries through migration and, therefore, its root causes deserve to be alleviated. The keys to accomplishing these are perhaps among others to empower institutions established to control public accountability crisis with suitable legislations as well as federal government being responsive to the social welfares and economic rights that narrow inequality among social strata of the people.

More importantly, the entry recommends social-citizen demand-side accountability. This implies organized civil society groups should encourage grassroots movements to play a greater role in shaping the corruption discourses, and also mobilize the masses on peaceful protest of civil

Source: Author's fieldwork, 2017

disobedience to demand resignation and prosecution of any government official that involves in an act of corruption. This will surely prove a difficult task. Nevertheless, it is a task and action worth embarking on, which must continue until the masses achieve their demands.

To ensure accountable and sound public administration, there is a need to have a severe punishment for all forms of unethical practices, including putting more emphasis on patriotism or pan-Nigerian nationalism over and above micro-nationalism in combating unethical practices, lack of accountability, and corruption in Nigeria. The virtue of patriotism is a thing of the mind. There is no country in the wider world where there is low level of unethical practices with no corresponding high level of patriotism. When a public servant or a political office holder defrauds the federal government and spends the loot on his family, home, community, or the church, he is portraying that he loves these entities more than the state.

Moreover, a compulsory system of open debate among aspirants or candidates for all elective positions should be instituted for public scrutiny. The agenda and conduct of the debate will be set and implemented by credible media, and civil society groups into good governance and transparency issues. While Code of Conduct Bureau (CCB) and the Code of Conduct Tribunal (CCT) should wake up from their slumber and hold all political officeholders who have completed their tenures or out of government to account. Where CCB and CCT fail to do their jobs of prosecuting inaccuracy of assets declaration of public officeholders, organized individuals/civil society group or member of the public should obtain *writ of mandamus* from a competent court, commanding CCB and CCT to act on abuse of offices by former political officeholders. Also, citizens seeking employment in the Federal Civil Service of Nigeria must be subjected to rigorous background check by Federal Civil Service Commission (FCSC) before employment.

In addition to the above recommendations, the following concrete steps should be taken to sanitize individuals in the Nigeria public administration: (1.) The National Assembly should enact a law for the removal of "Executive Immunity Clause" from the Nigeria Constitution, so that serving President, Vice President, Governors, and Deputy Governors can be prosecuted while in office. (2) The National Assembly should enact Whistle Blower Protection Act, to protect the lives and jobs of those who link information of abuses of public offices to the anti-graft agencies. In other word, those who give evidences of corrupt practices against public officers in courts should be protected by the Act. (3) The National Assembly should enact Public Declaration of Assets by all federal elective, appointive public officeholders, and top bureaucrats such as the executive president/vice president, executive governor/deputy governors, legislators, judges, ministers, permanent secretaries, departmental heads, and directors/managers of public agencies. This declaration should be published on National Newspapers or federal government website for public scrutiny. (4) The National Assembly should pass a law that will increase the independence of the Economic and Financial Crimes Commission (EFCC) through greater security of tenure of the EFCC chairman to enable the agency pursues robust and independent investigations of high-level corruption. (5) The presidency should deploy technology such as Closed-Circuit Television (CCTV) in every upper level of the Nigerian governance structure and its environs to monitor and track public service activities. (6) National Assembly should pass a law for compulsory publication of breakdown budget of the three arms of government as well as publication of activities of Ministry, Department and Agencies of government on their websites and national newspapers. (7) Distinguished Nigerians with proven integrity should come together and form "Nigerian Agency of the Just." The Agency should comprise a network of anti-corruption activists, lawyers, bankers, prosecutors, and leaders of law enforcement agencies. The body should be saddled with the responsibility of checking and ensuring all institutions of government and nongovernmental institutions comply with best practice, including transparency, in a bid to avoid corruption. Any institution that does not meet the agency compliance standard would be unlikely to get access to public contracts, aid, or loans.

# Ethics and Crisis Management

Carole L. Jurkiewicz
McCormack College of Management, University of Massachusetts Boston, Boston, MA, USA

## Synonyms

Crisis response; Emergency response; Ethics under duress; Unexpected events

## Definition

The ethical implications in responding swiftly and effectively to an unexpected and disruptive event, which can occur both internal to an organization (e.g., scandal), or external (e.g., hurricane).

## Introduction

Crises spark a resultant set of behaviors focused on self-preservation and safety, whether the crises are inflicted by external occurrences such as environmental disasters, economic upheavals, or political mayhem, or internal to an organization as a consequence of scandal. These behaviors are the determining factors in whether an organization will successfully survive the attack. Without preplanning and a clear set of policies and practices outlining what steps should be taken in a crisis and by whom, employees tend to react in idiosyncratic patterns meant to address their personal priorities and concerns. Individualized responses can create havoc and undermine both the organization's functionality and its ability to respond to the needs of the community in which it operates. Specifically, crisis situations present unique and prime opportunities for unethical behavior to occur, both opportunistic unethicality or that perceived as justifiable given the situation. Having a crisis plan in place and ensuring everyone's familiarity with and access to it allows organizations to anticipate some unethical behaviors, and to detail oversight processes as part of the crisis planning effort. Advance planning can prevent harms to both resources and reputations in the organization and society, beyond that caused by the crisis situation itself.

## Overview

When stability is replaced with upheaval, when people face unexpected crises and the concomitant and urgent need to protect and survive, ethics often takes a backseat to more tangible concerns. As a plethora of news reports document, it is during crises when individuals feel unconstrained

by ethical considerations and instead act to maximize their personal advantage and in doing so rationalize actions they would, under everyday conditions, denounce as immoral. This self-serving focus is consistent across all socioeconomic classes, although the types of unethical behaviors usually seen vary considerably. Ethics in practice appears to be a superfluity to which people attend after their basic needs are satisfied.

Nine of ten Americans live in areas at risk for flooding, hurricanes, earthquakes, tornadoes, and other disasters, underscoring the importance of understanding the ethical dimensions of crises. Maslow (1998) well-known hierarchy of motivation offers a rubric for understanding that during times of crisis, individuals seek to satisfy the basic requirements of food and shelter through any means necessary. Situational behaviors such as these are generally understood to be exceptional and extreme actions resultant of duress, and as such are not necessarily indicative of an individual's ethical framework as a whole. This lenient view of ethical digression has been articulated by a number of ethicists and is a linchpin of Kohlberg's (1981) stratified model of ethical reasoning.

Conversely, applying Hume's (2009) view of humanity, all individuals could be viewed as having the same drive toward unethical behavior and are simply taking advantage of situation to advance their ability to do so. According to Payne (1996), behavioral norms are rooted in one's socialization through socioeconomic status (SES), and such norms can predict behavior. This monograph asserts that this predictability can be transferable to crisis situations, as detailed in Table 1. As crises free individuals from the restraints of ethical frameworks and socialized norms can predict behavior, one can postulate what the nature of such unethical acts may be in such extreme circumstances. Indeed, media reports in the wake of crises provide ample evidence to support this hypothesis. The primary interests of organizations during crises are continued viability, organizational culture, costs, reputation, social responsibility, and legal liability. Being alert to the processes that can impede these goals help an organization plan for and forestall the possible negative impacts.

## Predicting Unethicality by SES

The framework detailed in Table 1 provides a tool to understanding ethics in crises and can be helpful in tailoring organizational plans and interventions in order to staunch chaos, bring assurance to employees and citizens, and begin mitigation and rebuilding efforts. Distribution of materials in advance of and immediately following the impact, targeted to the specific needs and concerns of individuals in each SES should include an acknowledgment of their particular needs, offer positive and specific solutions on how to address their concerns, and outline the consequences of engaging in unethical behavior to satisfy their needs outside acceptable societal and legal mandates. Given that communications are usually severely restricted in the immediate aftermath of a crisis, precrisis citizen and organizational contact, along with that of emergency workers, have the potential to significantly reduce the ethical crises that worsens the negative consequences of many disasters.

Table 1 illustrates the framework for understanding these SES-related behaviors and their implications for potential unethical actions following a crisis. Individuals at lower SES levels are likely to have faced financial, health, personal, and criminal crises on a regular basis. Crises, then, are more so a common facet of life rather than an anomaly, as it is likely to be for middle and upper SES individuals. Individuals at lower SES levels are typically also accustomed to receiving government assistance of some type at some point in their lives, and to the long waiting periods and paperwork that are integral to working with large bureaucracies. Given that, individuals in this economic class grow accustomed to authority figures overseeing their life choices and protecting them and their interests. These factors explain why lower SES individuals directly impacted by crises usually seek government help, await rescue, and follow directives to public shelters. Middle and upper

**Ethics and Crisis Management, Table 1** Priorities following crises by SES group

| |
|---|
| Lower SES |
| Locate friends and family |
| Seek immediate gains from situation before it stabilizes |
| Seek external assistance to fulfill basic needs |
| Embrace opportunities to plead plight, proclaim victim status, preferably through immediate news outlets such as television, print, and electronic media |
| Seek solace in religious communities |
| View circumstances as freedom from rules/laws/restrictions to which they are normally unduly subjected, an opportunity to celebrate; extreme expressions of this unbounded freedom from a system seen as oppressive system can lead to increased looting, murders, rapes, and thefts |
| Middle SES |
| Seek to repair property, access insurance agents, rally neighbors for social gatherings |
| Seek to get lives back to normal as soon as possible including grocery store openings, gas station access, utilities restoration, banks opening, movies, restaurants |
| Get schools back in working order |
| Return to work as soon as possible |
| Contribute time/resources to nonprofit organizations |
| Ensure autos are operable |
| Strategize on how to earn money through entrepreneurial activities, can lead to scams and price-gouging with those in need targeted as victims |
| Desire to be seen and recognized for pulling self up by boot-straps, helping themselves, viewed as heroes |
| Seek print and electronic media outlets, television to report their achievements, portrayed as beating the odds, vanquishing disaster |
| Communicate how hard they are working, how little sleep they are getting, embracing martyrdom |
| Stress of trying to replace and restore as quickly as possible and be seen as superhuman in this regard can lead to increased incidence of domestic violence and child abuse |
| Higher SES |
| Determine long-term opportunities offered by situation for investments, rezoning property acquisition, mergers |
| Assess impact of crises on assets/investments |
| Seek potential for political change and gain |
| Using power of pocketbook and influence to target enemies |
| Seek to enact plans that rules/circumstances prior to storm had prevented, to use crisis as entre impetus to achieve strategic plan |
| Reach out to important networks to assess opportunities, seek to expand scope of influence |
| Avoid media and prefer behind the scenes exercise of influence/power |
| Concern with national and global view of situation and impact on their resources/circumstances |
| Presume and exercise influence to be first to restore utilities to their businesses, homes |
| Appearing unruffled by circumstances, untouched and untouchable |
| Seek opportunities to create legacies through exercising influence following crisis |
| Strategically assess opportunities for potential future impact |
| Focus on opportunism may lead to business-focused social reconstruction, insider trading, monopolies, mergers, and eliminating competition |

Adapted from Payne (1996)

SESs have behavioral norms that, while differing between the two groups, facilitate self-sufficiency, develop methods of organizational influence, and provide individual resources to mitigate the impact of crises; it is from this basis that their ethical violations follow in crisis situations. Individuals within a class more easily rationalize their ethical transgressions as part of the culture and mode of behavior, while between classes such consideration is replaced by incredulity and harsh judgments.

Based on the motivating factors and behaviors listed in Table 1, it is possible to speculate what type of ethical violations each SES group could be most likely to engage in, if they were so inclined. As suggested earlier, individuals of lower SESs who perpetrate ethical violations following a crisis are more likely to seek prospects that provide for immediate satisfaction of needs and desires. The ethical violations of Middle SESs following crises could be expected to file inflated insurance claims, obscure damage to property in order to realize maximum resale value, diminish inhibitions regarding the use of firearms to protect their property, seek profits through price gouging, create opportunistic product/service enterprises marketed as crisis alleviation, create false non-profits online connected to the disaster, and offer inferior products for high prices. Upper SESs who engage in ethical violations following a crisis could be expected to take a longer-term approach, engaging in acts usually termed white collar crimes. These include embezzlement, using false documents to enhance position, financial schemes, exercising undue influence, seeking rezoning of affected areas to purchase at the lowest possible prices, using insider information to eliminate their competition, and exerting political pressure to get favorable and prioritized services, removing unfriendly politicians from office, and other such crimes.

## Conclusion

The ethical culture of some societies intrinsically restrains dangerous behavior under duress, while others are more in need of behavioral interventions during crisis in order to effectively minimize illegal and unethical behaviors. Class differences can also be expected to impact the efficacy of any outreach efforts. Given that low SES individuals are seen as having a short-term time frame through which they view behaviors and their consequences, they could be expected to react most positively to immediate pre- and postcrisis interventions. Middle SESs would, in turn, be less likely than lower SESs, but more likely than higher SESs, to be persuaded by such outreach programs, as these groups take relatively broader assessments of actions and their consequences. Strategic interventions to reduce or prevent illegal or unethical behavior following crises entails differing methods of communication based upon SES, each directed to contact points citizens would customarily have in the course of their lives. For instance, lower SES individuals can usually be contacted through religious venues, stores whose customers are primarily lower income, and where they normally intersect with public service resources, such as food stamp distribution sites. Middle SESs can be generally be reached through schools, places of employment, and religious organizations. Higher SESs can be contacted through business luncheon venues, business publications, business associations, and financial institutions. Effective and thorough crisis preparedness should include not only organizational concerns, but those of their employees and customers as well. Anticipating unethical violations can reduce and possibly prevent exacerbation of the crisis that may overshadow the direct costs of the disaster itself.

# Ethics and Duty

Gavin Woods
Public Service Commission of South Africa, Western Cape, South Africa
Professor Emeritus, Stellenbosch University, Western Cape, South Africa

## Introduction

Notwithstanding the mutually inclusive relationship between the issues of duty and ethics, insofar as these relate to employees in any organization, it is useful to offer some explanation of their respective yet related meaning.

A literal understanding of what **duties** are is what an employee has to do because it is morally or legally necessary. It can be said that an employee within an organization has a duty to work competently, to be accountable, to be transparent, and to work with integrity. Duties can be more specific in that these would, for example, require the employee to strive toward achieving the organization performance objectives – which could involve profit targets, product or service quality levels, or particular efficiency standards.

**Ethics** for its part is a more intellectually contemplated subject. It is a considered branch of philosophy and is an established normative science as it deals with the norms of human behavior. However in that the subject has fundamental behavioral and social dimensions, the persuasions of certainty of the humanities and social sciences such as psychology, anthropology and sociology are useful to our understanding of ethics and its role in the modern organization.

Ethics has also been described by Eduard (2016) in a Wikipedia entry on Public Sector Ethics as the entirety of rules of proper moral conduct corresponding to the ideology of a particular organization or society (Fox 2010). It is in short a system of moral principles and rules of conduct which flow from the philosophical study of the nature of good, virtue, right and other orally relevant terms (Fox 2010).

The issue of morally motivated actions is therefore the basis for both the duties and the ethical behavior of employees in the organization and is hence what allows us to incorporate both in a single discussion. It is important to note however that while duty-related obligations within the organization are fairly universal, in the case of ethics, there can be some variation due to the particular society and its cultural norms.

### The Public Sector Emphasis

Matters such as ethical practices and the fulfillment of duties by employees are of interest to all organizational constructs across both the private and public sector divide. Public sector organizations however differ from those in the private sector, not so much in the objective of optimally using the resources at their disposal, but rather in the interests they respectively serve.

In the case of the **private sector organization**, the duties of employees and the ethical dimension thereof are in the interests of the owners (shareholders) who expect the efficient and effective endeavor of their employees in the overall pursuit of financial gain. The employees accordingly are duty bound to serve their employers with dedication, and ideally the organization as a whole is expected to conduct its affairs in the commercial market place with fairness, integrity, and a social conscience.

However, in the case of **public sector organizations** and the officials who administer these organizations, there is less of an obligation to serving and being loyal to the interests of an identifiable owner and more of an obligation towards serving the elected government and the public in general. It therefore takes a somewhat different motive to that of the profit imperative in realizing their public servant role and purpose toward that of the broader public interest. Idealistically it is required that public officials see themselves as less individualistic and rather having more of a selfless attitude of working actively and passively in the service of the society and its members.

The specifics of what public sector duties are and what their ethical application is, both actively and reactively, cover a wide range of considerations. In addition to the duty toward meeting their actual job-related responsibilities and possessing the competency to do so, the public officials' more inherent duties would essentially include a constant striving toward meeting service standards, being compliant with relevant laws and regulations, optimizing the use of public resources, and being transparent and accountable with regard to the public they serve.

As with these duties, the ethical prerequisites of the public official address the fundamental premise of their being a steward of the public interest. This concerns the moral justification and consideration for decisions and actions made during the completion of daily duties when working in the interests of the public. This is guided by a constant and essential sense of honesty, fairness, and probity. The list of desirable qualities can be extensively added to as demonstrated by Cody and Lynn (1992).

Of relevance are the observations of the great sociologist Max Weber which led him to suggest that "an official must exercise his judgement and his skills, but his duty is to place these at the service of a higher authority; ultimately he is responsible only for the impartial execution of assigned tasks and must sacrifice his personal judgement if it runs counter to his official duties" (1921: 650).

### The "Organizational Culture" Issue

There have been and there still are governments around the world where a collective attitude which adheres to a duty and ethics related conduct is in evidence. This, as an organizational culture, is where a public sector organization in an encompassing way strives to serve the public in an efficient, fair, and honest manner. Regrettably there are all a number of examples of where this is not the case.

The culture should in ideal terms be imbued with qualities which are fundamental to the organization such as its vision, values, attitudes, beliefs, and its work philosophy.

As with all organizations, it begins with the individual official and him or her subscribing to a shared set of organizational qualities. It concerns how in an organization the personnel behave toward each other and how through their engagement with their work responsibilities they behave toward their external stakeholders. The "public service" character of public sector organization understandably leads to a somewhat different organizational culture to that found among private sector organizations.

Arnold Heidenheimer, a commentator on the subject of organizational culture, as cited by Gildenhuis (1989: 13) when making makes reference to the **moral-theoretical culture**. He points out that all public officials should recognize their role as trustees of public good and should understand this as the basis of the kind of moral behavior the public should expect from them as public servants. An acceptance of and commitment to such an understanding by the officials themselves are important for the moral-ethical culture to exist in each government organization.

This all relates to what is known as the **public sector ethos** which has been widely written about, albeit in fairly idealistic terms, and which, as noted by Vandenabeele and Horton (2008: 17), has been increasingly challenged in the modern era. This is due to a tendency toward public officials becoming advisors for the formulation of policy, to the introduction of market values, to the shift from a compliance to a performance emphasis, and to the politicization of the civil service and its greater loyalty to politicians.

These developments appear to detract from the "servants of the people" mind-set which had prevailed in many developed countries around the world.

### Ethics and Public Accountability

Established principles and agreed-to-ethical practices also provide an accountability standard against which the public can scrutinize the work undertaken by officials. It should be observed if or not decisions taken within these organizations are based on these established practices and principles – which are what society would generally regard as being right and proper of their government.

Public sector ethics can therefore also be viewed as an attempt to create a more open and transparent state of affairs within government operations so as to allow the public to know what to oversee and what to hold public officials accountable against. This is all of course dependent on the public themselves having sufficient interest in matters of government and its upholding of sound ethical principles and standards.

### Codes of Conduct

Codes of conduct, which are sometimes referred to as codes of ethics, are meant to promote the ethical principles that the public would have the public administration subscribe to – in that the Code serves to remind all officials within the organization of the conduct that is expected of them. The substance of these Codes have in many public sector organizations across the world converged to reflect the evolution of a more universal code representing an international consensus as to what constitutes the essential ethical compliance issues.

The Code should not be regarded as an end to itself in the promotion of good conduct. It should more importantly be an effective instrument for the practical application of good rules of conduct and as such is most important to the achievement of desired standards of ethical behavior.

To be more specific, the Code, which is usually documented and actively promoted within the organization, is based on values, principles, and practices that should be pursued and on the other hand stipulates practices which should be avoided. Key behaviors for officials to abide by would include loyalty to the organization, a commitment to its aims and performance objectives, the promotion of service to the public, the rejection of improper personal gain, the avoidance of conflict of interest situations, the preclusion of nepotism, the rejection of the receipt of bribes, and adherence to the principle of fairness in their interactions with members of the public.

### Earlier Thinking on Public Sector Ethics

Even though the subject matter concerning the duties and ethics of civil servants has become increasingly highlighted in recent times, it has nonetheless been topical among certain opinion makers for over 200 years.

In particular **duty-based ethics**, also known as **deontological ethics,** has long been a particular school of thought and was in fact first argued for by the eighteenth century philosopher Immanuel Kant. This advocacy, in the context of a community or society, recognized the interrelationship of the ethics and duty of the individual citizen in his or her daily interaction with others (Sevenpillars undated). The school of duty-based ethics, which was also promoted among government structures, is however controversial in that its concern with what people do and not with the possible consequences of their actions is seen to be unrealistically narrow. In other words, absolute principles should be obeyed, regardless of the outcomes these might produce (BBC 2014). An example of an absolute principle would be unfettered openness and honesty in every situation.

Opposed to the deontologists are the **utilitarians** who believe that the end which is sought justifies the means to that end (Moreland 2009). In other words, if an ethical solution is more costly, for example, a utilitarian will argue from a standpoint of efficiency and effectiveness to justify a less ethical solution.

The definition of these two behavioral models is not necessarily exclusive. It is possible for a person to make a decision based on a utilitarian stance and then follow a deontological stance for a separate decision. This is because the concept of ethics can be ambiguous and is ultimately based

on principles and values, which can differ among situations and people.

Today with the hindsight of much observed experience, the internationally accepted model would appear to be more, one which while premised on established principles and practices allows for a degree of flexibility where this is necessary to avoid poor management decisions.

### The Democratic Context

The development and spread of democratic forms of government across the world have long been synonymous with an ever-growing recognition of the importance of ethically managed government institutions. It can be said that the promotion and upholding of democratic values and practices are in a significant way dependent on how the administrative arm of government goes about fulfilling its duties.

A democratically elected government, which was described by Abraham Lincoln as "government of the people, by the people and for the people (Lincoln 1863)," is so chosen by the people to serve their needs and those of the country as a whole. This in turn requires a particular guiding ethos of the administrative structures and of the elected representatives of the people who manage and oversee those structures.

Currently the constitutions of almost all democratically run countries are quite specific in establishing structures and institutions of government to serve the public and thereafter in instructing government officials to strive to become entrusted servants of the people. To this end, the constitutions also spell out the values and principles which government should adhere to in the implementation of laws and policies which underpin the democracy and to do so in a way which promotes public accountability and transparency. Government officials are thus prompted to function in a particular reality which accentuates their duty to the public and the ethical dimensions thereof.

### The NPM Context

As eluded to by Lewis and Gilman (2017:27) the New Public Management (NPM) approach to public administration has, since the late 1990s, added greater substance to what the duties of government organizations are and how these should in a practical sense be carried out by public officials.

NPM which is essentially an adaption and adoption of proven private sector approaches to management seeks to modernize and professionalize the public sector in a way that brings about a more efficient and effective use of the resources at its disposal – in order to improve the delivery of public goods and services. To make this possible, it has been necessary to encourage the emergence of a more modern type manager in state organizations and to grant these managers greater planning and decision-making authority so as to allow them to do what is required to achieve raised levels of performance. This has also meant making the management environment less rule bound which understandably has led to a discernible shift of emphasis away from compliance and toward performance.

Potentially this held implications for ethical standards in the organization as did the increased focus on pursuing new value-for-money type goals as this might well encourage management decisions which skirt around matters of ethics and in so doing create situations in which corruption is more possible.

Further, this has tended to make the noble notion of government employees as individuals who have responded to a calling of public service as being somewhat outdated. It has been seen to lead toward a more individualistic and careerist type official whose personal work goals are directed toward optimizing outputs and outcomes.

NPM reforms have produced differing results in different locations. While there are countries where governments have made very significant performance gains particularly where management has been vigilant and sufficiently disciplined to not allow a lowering of ethical standards, in other countries with governance and financial management failings, the opposite has been true.

### The Governance Perspective

In response to NPM reforms and the possibilities of distracting public sector management from its ethical responsibilities, many governments have

moved decisively toward introducing improved corporate governance regimes.

As with the NPM reforms, the heightened governance arrangements have by and large been adopted from the private sector. It was in the commercial environment that lessons were learnt as to how increased pressures for performance needed to be balanced by measures which could effectively discourage conduct which undermined the sought-after ethical culture of the organization.

To protect the integrity of the organization and to counter behavior which might otherwise come from a less dutiful and ethics-focused official, initiatives such as an expanded external audit scope, internal audit structures, risk management, corruption prevention plans, and other effective internal controls have been implemented. Best practice rules including a range of checks and balances, separation of duties and clear delegation, and accountability arrangements have also been introduced.

At a time when it is generally speculated that public servants no longer have quite as strong as reputation for being the trusted custodian of public funds, it is essential that these internationally established best governance practices are made mandatory.

## The Modern Financial Management Context

It must also be observed that central to the NPM-related reforms has been the introduction of an extensive range of financial management reforms. Beginning in the mid-1990s and growing steadily since then, these reforms have produced a significant coming together of international thinking as to what a best practice public sector financial management model should be. Such a model has evolved and has now achieved wide agreement and support across both developed and developing countries.

What motivated this system-based model was the almost universal demand for a level of financial management that would make possible the quantity and quality of information necessary for good operational planning and for an effective performance system.

The basis of this approach came from the recognized need for fully planned and fully costed budgets, which are aligned with predetermined performance objectives and goals.

All in all, these financial management reforms produced an organizational environment in which, by being given realistic performance targets to achieve, officials had a measurable basis against which they could be held accountable for their meeting of their allocated duties and in which the ethical use of state resources was more enforceable. Also, through the ongoing monitoring of results against the carefully considered performance standards, management was in a position to establish where officials were failing to meet their responsibilities and where money might be being wasted or subjected to corruption.

## Ethical Dilemmas for Public Officials

Despite the reforms of recent decades, public sector organizations, being the large and complex arrangements that they usually are, remain a challenge for public officials when trying to honor their duties and maintain a high level of ethical standards. From time to time, there will inevitably be situations which arise that test the ethical resolve of employees from within the ranks of the public administration.

Such situations, as also referred to by Callaghan (2014), can be described as ethical dilemmas within the public sector work place. The more common of these would include where officials face the following:

Questions of fairness which call on the official to deal with everyone in a fair and objective manner. This would include how members of the public are treated as well as how officials within the government organization itself are treated.

Questions around conflicts of interest which ask that the official always ensures that decisions and choices made are never influenced by what might directly or even indirectly personally benefit that official.

Questions concerning the fulfillment of the official's responsibilities, particularly where this

concerns the quality of service being given to members of the public.

Questions of putting integrity at the forefront of every action and every decision taken by the official and of always being above reproach in any given situations.

Questions around transparency and accountability concerning all that the official is involved in and that formal disclosure of all relevant actions and performance is made public.

### The Dilemma of Corruption in Government

Officials have to morally transcend any workplace temptations or tendencies to not give of their best and to exploit opportunities for personal gain. This becomes more difficult in a world where individualism and self-interest are increasingly promoted across society mostly through a very influential advertising industry which at every turn tries to convince individuals to aspire to greater materialism and consumption.

The challenge is for public officials to disassociate themselves from this reality – which besides the moral resolve of the individual official requires a strong and ongoing campaign by government leaders and by civil society to more deeply imbue the public servant with relevant ethical values and a sense of duty toward the people that they are meant to serve.

By almost every account, public sector corruption has risen steadily in almost all countries, with a number of developing countries experiencing endemic levels of wrongdoing. Bribery of public officials has caused many countries to introduce specific anti-bribery laws through which to discourage members of the public from transacting dishonestly with public officials – be this to escape a traffic fine or to secure a government tender.

Given such developments, the promotion of a sense of duty and high ethical standards becomes all more important within the public administration. In the modern world, achieving a new paradigm in which public officials generally resist an otherwise deterioration of the desired qualities of ethics and duty has to be pursued.

Codes of conduct must become living guidelines, senior managers must lead by example, and the new governance and financial management practices would seem to be the best combination of initiatives toward combating the scourge of public sector corruption.

In addition, a greater understanding of regulatory ethics must be sought, as this is a body of law and practical political philosophy that can govern the conduct of civil servants and their relationship with the businesses and industries they regulate and transact with, as well as address concerns about transparency, freedom of information, and conflicts of interest.

## Conclusion

It is apparent that ethics and duty are thematic to the cause of good governance. While more topical and more earnestly contemplated in some countries than in others, this subject matter is inherently pivotal to how all government institutions regard their role and in particular how they prioritize their serving of a country's people.

The established and the maturing democracies of the world appear to be responding to the demands of the electorate that they manage public resources in an ever more effective and efficient way. This translates to a growing demand for officials to not only raise the quality of the public goods and services they dispense but to do so without forsaking the traditional sense of probity which should pertain to those involved in the public sector. This presents its own set of challenges but none of which would seem to be so great as to detract from a fulfillment of the duties and ethical behavior that is required.

# Ethics and Equality

Dan Krejci
Department of Political Science and Public Administration, Jacksonville State University, Jacksonville, AL, USA

## Synonyms

Ethics: Beliefs; Conscience; Ethos; Ideas; Moral; Moral character or traits; Moral code or principles; Moral compass; Tenets; Values

Equality: Egalitarianism; Equal opportunity; Equivalence; Fairness; Impartiality; Sameness; Similarity; Social equity

## Definition

Ethics: A standard of right and wrong that is freely accepted by members of a group, organization, profession, or society.
Equality: The concept that members of the society have a right to be afforded the same opportunities, rights, and status as other members of the society. In public administration, the concept of equality is closely associated with social equity. Equality focuses on ensuring that people in a society are treated the same and that all people receive an equal measure of the benefits of government in order to have a decent quality of life. Closely associated with equality, as it regards public administration, is the concept of social equity, which focuses on ensuring that government provides to the people the things they need in order to have a decent quality of life. Equity is based on needs of the citizens, whereas equality is ensuring that all receive an equal measure of the benefits of government.

## Introduction

The Minnowbrook Conference established the New Public Administration movement, and the focus of the undertaking was to move the discipline of public administration away from administrative orthodoxy toward something more comprehensive, something that looked beyond the hierarchy, efficiency, and effectiveness of government organizations, as well as the separation of politics and administration. New Public Administration emphasized the addition of social equity – providing public services with a sense of equality – to the equation along with maintaining efficiency and effectiveness. Yet, the discipline of public administration also notes that another vital element of the profession is ethics. To understand the elements of New Public Administration, definitions of the terms follow.

Efficiency refers to how well an organization performs its mission, and effectiveness is the impact the organization has when it performs its mission. Equality is the belief that members of a society have *a right to be afforded the same opportunities*, *rights*, *and status as other members of the society.* Within the discipline of public administration, equality is associated with the concept of social equity. Social equity, in the context of public administration, means that public administrators are engaged in activities to ensure all constituents have *ample access to political and economic power* that is provided by the public organization and within the public arena and the focus is to improve the quality of life of all citizens.

In order to promote efficiency, effectiveness, and equality (social equity), a fourth element is discussed at some length in the discipline, and this element is used to ensure the achievement of the other three – this element is ethics. In the profession, ethics is recognized as an important component. The adoption and promotion of ethics and ethical conduct are considered a necessary condition for promoting efficiency, effectiveness, and equality/social equity. However, ethics is not a sufficient condition to ensure efficiency, effectiveness, and equality (social equity). In the sections that follow, the various types of ethics that are commonly discussed within the profession are briefly described, followed by a discussion of equality, and finally a discourse on the relationship between ethics and equality. In particular, ethics in this context is referred to as administrative ethics. Administrative ethics is concerned with how public administrators apply moral principles to the functions and activities of the organization.

### Ethics

In a general course on administrative ethics, several types of ethics are usually included in the discourse. In the sections that follow are brief descriptions of the various types of ethics, followed by a discussion of equality and the various concepts of equality, followed by a section that relates the methods of ethical decision-making in the public administration arena to the concept of equality – particularly equality of opportunity, equality of condition, and equality of result or outcome.

### Types of Ethics

A comprehensive understanding of administrative ethics is achieved by breaking the term down into its two components – administrative and ethics. In the public administration discipline, the term *administrative* relates to the duties and responsibilities necessary of the day-to-day operation of government as well as nonprofit organizations. This would include administrators who are in positions of authority as well as the *street-level bureaucrat* (the person who has direct contact with the public in the performance of the person's duties). Continuing in the public sector vernacular, ethics is not only the study of moral choices and the various ways a person makes these moral choices in the context of providing government and nonprofit sectors, but it is also a field of study within academia. Even though the literature within the public administration discipline could never be covered in its entirety within a book or article, what follows is a brief discussion of the major classifications or approaches to ethical reasoning: teleology, virtue ethics, and deontology.

## Teleology

Teleological ethics can be classified into two perspectives – utilitarianism, based on the works of Jeremy Bentham and John Stuart Mill, and egoism, derived from works by Niccolò Machiavelli and Max Weber. Utilitarianism calls for action that is based on the premise of the greatest good for the greatest number, as noted by Bentham. This perspective calls for balancing good against evil based on the needs of society as a whole. Bentham and Mill go so far as to define the concepts of good and evil as pain and pleasure. Egoism, with regard to ethics, promotes the concept that people will act in ways that promote their own interests over the interests of others, which is not to be taken in the light that the people are focused entirely on themselves – they may be motivated to promote their own interests through the promotion of the interests of others. In other words, ethical egoists in the public sector may believe

that in order to achieve success in their careers, it is best to appear as if they hold the interests of others before their own, but in reality they are promoting their interests through the appearance of supporting others.

### Utilitarianism

According to William K. Frankena, a moral philosopher who taught at the University of Michigan for over 40 years, the utilitarian approach can be classified into three distinct categories. In the first edition of his work entitled *Ethics* (1963), he classified utilitarianism into only two categories – *act* and *rule utilitarianism*. A public administrator operating from the *act utilitarianism* perspective would pursue a course of action that he or she considers proper by making decisions based on the principle of utility – the greatest good for the greatest number by balancing good over evil. A public administrator who made decisions using rules – like telling the truth – rather than asking what course of action would produce the greatest good would be operating from the perspective of *rule utilitarianism*. Rule utilitarianism focuses not on what action produces the greatest good, but rather on what rule produces the greatest good.

In his second edition of the work *Ethics* (1973), Frankena added a third category – *general utilitarianism*. General utilitarianism basically assumes that if something is right for an individual to do in a particular situation, then it is the right thing to do for another person in a similar situation. Under this premise, the question that needs to be asked is not about what one person would do in a particular situation, but rather "What would everyone do?" The three categories of utilitarianism, in some fashion, are still viewing decision-making from a similar perspective of the greater good.

### Consequences

Regardless, the teleological approach to ethics focuses on consequences. In other words, when using the teleological ethics approach at some point in the decision-making process, the administrator engaged in performing his or her duties makes a calculated assumption at the consequences of the actions chosen in any given situation. The process is not synoptic, but more along the lines of Simon's (1957) theory of bounded rationality. Bounded rationality assumes that knowledge is limited; therefore, policy choices are restricted to a narrow range that policymakers are satisfied with – referred to by Simon as *satisficing*. As such, public administrators, using the teleological approach to ethical decision-making, make decisions based on the information that is available as to what the possible outcomes (consequences) will be.

## Virtue Ethics

James Madison, writing in *The Federalist* No. 51, noted that if angels ruled, then there would be no need for government. However, since angels do not rule, the difficulty of governing is twofold. The first difficulty is getting government to control the governed, and the second difficulty is getting the government to control itself. When it comes to making decisions to act or not to act, there are several known facts: governments exist, people run governments, and, from the democratic perspective, governments that have the goals of accountability (being answerable to those who are governed) and transparency (government decision-making takes place that are made apparent to those who are governed), methods must be and are adopted to ensure the achievement of these goals and to do so ethically.

Granted laws or policies can be created, to govern a society, but these laws can be unethical. There are several examples of laws that were adopted that were morally reprehensible even if they were *legal* within a system of government, and two are presented here. A prime example of this was the adoption by Nazi Germany of laws and racial policies that were an extension of the regime's Lebensraum policy. In addition, the issue of owning slaves, which many countries have at one time or another adopted as a policy, falls within this category of an act that was legal on the surface, but immoral in principle. In addition to laws, ethics has been a centerpiece of the discussion as to how governments and nonprofit

organizations should deliver their services. Virtue ethics is one of the types or approaches that is tied to public administration, yet unlike teleological ethics, virtue ethics is not governed by rules of conduct.

Virtue ethics is easily defined by breaking the term down into it two components. Virtue is behavior of an individual that demonstrates high moral standards and a behavior that is considered a desirable trait – the trait or character of the virtuous person. Since virtue is focused on the individual, then virtue ethics is focused, on inculcating in the individual (in this case the public administrator) the desire to cultivate moral habits that drive the individual's administrative conduct and other factors (rules, laws, or polices) take on less importance. To reiterate, virtue ethics focuses on character not rules.

Aristotle, in *Nicomachean Ethics*, has been most influential in positing virtue ethics. As previously mentioned, virtue ethics does not look to rules for the governing of a person's conduct or character. Virtue ethics do not view actions as right or wrong in and of themselves, rather the acts are right based on what a person of virtue would do. The person who would be considered a virtuous person would then serve as a role model that provides the example of the way people should conduct themselves. Whereas in other ethical approaches, rules or principles are important, yet when it comes to making administrative decisions – based on virtue ethics – emotions, experience, and maturity are important.

A virtuous person relies on emotions since emotions allow a person to see what is relevant in any given situation and emotions allow for empathy to be part of the decision-making process in order to help a person to determine what the right course of action is as well as to motivate the person to take the right course of action. When it comes to emotions, the emphasis is on emotional maturity, which could be characterized as a person who has fully developed his or her sense of empathy. A person who is not empathetic would not be able to determine the right thing to do or operate from the virtuous perspective because empathy derives from emotions and when it comes to being a virtuous person, emotion is an essential element of the virtuous character. Yet emotion alone will not make a person virtuous.

To become a virtuous person requires education – an education that is focused on how a virtuous person develops a virtuous character. In addition, a person needs to have experience taking actions that are based on what a virtuous person would do in a given situation. The example that is usually given of a person who is virtuous focuses on the issue of courage. A virtuous person who is courageous is one who knows what dangers are involved in a situation, has the ability to control those emotions that would hamper courage (fear, particularly fear of death), realizes that the action is based on empathy (wanting to save the lives of a person), and takes the courageous course of action. A good example of an administrator who is virtuous and is faced with committing an action that demonstrates courage is demonstrated when the virtuous administrator is faced with corruption and the only recourse to the corruption is to engage in whistle-blowing activity.

An administrator, who is courageous and is operating from a virtuous point of view, when faced with corruption can make an internal complaint, yet if this does not resolve the issue, the administrator may have to take his or her complaint to an agency or entity outside of the organization – this is known as whistle-blowing. The virtuous administrator in this situation would take this action if the administrator thought this would be the actions of a virtuous person or persons. The administrator would control his or her fears (losing a job or ruining his or her career) and pursue the course of action in order to resolve the issue of corruption because that is what a virtuous person would do in a similar situation. An administrator who studies and practices virtue ethics will not be persuaded by an argument to change his or her approach to dealing with the public simply on an argument "Everybody in the organization does it this way, why not you?" In other words, organizational culture may permit a more relaxed attitude toward ethics, but the administrator who adheres to virtue ethics will take action based on what the administrator thinks a virtuous person would do.

## Deontology

Ethical conduct that is based on duty or principle is known as deontological ethics. There is within the deontological person an innate desire to perform his or her duty based on a higher set of principles, particularly universal principles, and these principles take on the form of a formal obligation, which takes precedence over methods of ethical decision-making, particularly the teleological approach to ethical decision-making. The important question is: How do we establish higher-order principles that are universal and adaptable to ethical decision-making in the public sector? There are several approaches to deontological ethics: Kantianism, ethical and cultural realism, and agapism. However, when it comes to ethical decision-making, two *schools of thought* seem to dominate the administrative ethics discourse – *Kantianism* and John Rawls' *A Theory of Justice*.

### Kantianism

Immanuel Kant, in *Grounding for the Metaphysics of Morals* (1981), clearly notes the existence of a supreme or higher-order principle of morality. In addition, he further notes that all imperatives can be classified as hypothetical or categorical. A hypothetical imperative is an action that is aimed at getting what a person wants or may want. A categorical imperative is any action that is necessary in and of itself without considering any other end.

An imperative is simply an order – "Stop yelling at me." Hypothetical imperatives, as noted above, are commands that focus on a necessary action that is based on a desire (I want to be an engineer; I must become competent in math). However, if a person does not want to be engineer, then the hypothetical imperative does not apply. Categorical imperatives command unconditionally, regardless of any personal desire. If an administrator adheres to Kantianism, then a categorical imperative would command the administrator to pursue a course of action that is not based on his or her desire, rather the action would be based on the fact that the decision to act is necessary in and of itself. An example of a categorical imperative is "Do not take bribes."

Therefore, from the perspective of Kantianism, a public administrator's actions will be based on a sense of ethics or morality that is determined by the categorical imperative because that morality (or ethics based on this idea) is commanding the person to take a particular action and has no option but to obey. In other words, the public official could not claim he or she has an option not to obey or that in this situation this does not apply. The command is obeyed simply because the action is necessary in itself and that is all.

### Theory of Justice

The second school of thought regarding deontological ethics in the public administration discourse is posited by John Rawls (1971) in *A Theory of Justice*. Rawls (1971) starts with the assumption that parties involved in decision-making are operating from a *veil of ignorance*. This *veil of ignorance* does not allow the decision-maker to be aware of his or her alternatives. In this assumption, the *veil of ignorance* covers all aspect of the person's life (place in society including social status, natural abilities, economic and political standing in the community, or any particulars of the society). The only thing that can be assumed that is known is that the parties involved know that whatever decision is made, that decision is subject to justice and the implications that justice entail.

Rawls posits two principles of justice for institutions and two priorities. The first principle notes that all members of society are entitled to equal rights to basic liberties. The second principle posits that any form of inequality (social or economic) must be situated so they are a benefit of the least advantaged. The first priority, known as the priority of liberty, is that the principles of justice are arranged in such order that liberty can be limited only on the basis of liberty. The second priority (priority of justice over efficiency and welfare) notes that if an inequality of opportunity exists, then this inequality must improve the opportunities of people with lesser opportunity. In addition, whoever bears the burden of any hardship of a decision, something must be done to lessen that burden. Rawls noted that the principles and priorities are incomplete; however, it is

an attempt to provide a more structured approach to ethics, justice, and equality.

### Equality

Equality is the concept that members of the society have a right to be afforded the same opportunities, rights, and status as other members of the society. In public administration the concept of equality is closely associated with social equity. Equality focuses on ensuring that people in a society are treated the same and that all people receive an equal measure of the benefits of government in order to have a decent quality of life. As mentioned previously, closely associated with equality, as regards public administration, is the concept of social equity. Social quality focuses on ensuring that government provides to the people the things they need in order to have a decent quality of life. Equity is based on needs of the citizens, whereas equality is ensuring that all receive an equal measure of the benefits of government.

From a democratic viewpoint, equality can be classified in several ways, but generally there are three major classifications of equality: equality of opportunity, equality of condition, and equality of result or outcome. What follows is a discussion of these three classifications of equality, followed by section in which the approaches to ethical decision-making are related to the concept of equality and social equity. Equality of opportunity is listed first, followed by equality of condition, and equality of result or outcome is listed third. These classifications of equality are *ranked* in order based on the degree of more equality for the citizenry. In other words, equality of condition is a higher standard of equality when compared to equality of opportunity; equality of result or outcome is a higher standard of equality in a society than either equality of opportunity or equality of condition.

## Equality of Opportunity

This concept of equality calls for people in a society to be treated in a similar fashion. That every person should not be hampered by barriers, either real or artificial, or any form of partiality except in such situations that may warrant this difference in treatment. Equality of opportunity also applies to how government treats members of society with regard to the way citizens are allowed to participate, not only economically, but also politically.

A couple of examples that demonstrate situations in which people in a society are treated differently are based in public finance administration, particularly in the area of taxation. The first is *horizontal equity*, and this is when government charges the same amount to different taxpayers when the taxpayers' abilities to pay are the same (taxpayers who fall into the same tax bracket and make the same amount). The second is *vertical equity*, and this is when taxpayers who are different are treated differently. In the fairest form of the concept of *vertical equity*, a person in a higher tax bracket should pay more, while another person who is in a lower tax bracket will pay less tax. However, this is conditional upon the deductions that they are allowed. Yet, the allowing of deductions is another example of a situation that warrants the difference in treatment.

## Equality of Condition

Equality of condition goes beyond the boundary where equality to opportunity ends. Equality of condition promotes government policies that are aimed at eliminating the effects of past discrimination, which is a higher standard of equality when compared to equality of opportunity. Policies based on equality of condition would focus on issues that are economic as well as political. Under this concept of equality, government resources that were not previously available to a group – due to discrimination – would become readily available in order to overcome the past acts of discrimination. These policies would be redistributive involving not only income, but also may include other government resources.

## Equality of Result or Outcome

This standard of equality would go beyond the conditions established by equality of opportunity

and equality of condition. Equality of result or outcome promotes policies like affirmative action and comparable worth, which allows citizens previously disenfranchised to be afforded "equal footing" with other members of society. In addition, equality of result or condition can promote the concept of a state in which all people live under very similar economic and political conditions.

## The Marathon Race

One of the best examples for demonstrating these three concepts of equality is a foot race, particularly a marathon race. A marathon is a road race of 42.195 km (26 miles and 365 yards). Equality of opportunity would promote the idea that all people would be allowed to participate. Equality of condition would ensure that all runners are equally equipped, even if that meant redistributing some of the equipment that each person initially brought to the race for their personal use – those who had more would wind up having less and those with less would end up with more until a balance was struck between those with more and those with less. Equality of result or condition ensures that runners who were not able to complete the race would be provided assistance in order that all participants would finish. The next section applies the methods of ethical decision-making to equality.

### Ethics and Equality

Public administrators have the responsibility for the day-to-day operations of government. Street-level bureaucrats are generally the representatives of government that most people will deal with during their lives. Therefore, it is imperative that decision-making, particularly ethical decision-making in a democratic form of government, be focused in such a way that government and its agencies efficiently and effectively accomplish the goals of being accountable and transparent, promoting the general welfare, accomplishing the respective missions of its agencies, and doing so in an ethical manner that promotes not only equality but social equity as well. As such, the methods that a democratic form of government uses when making decisions need to be grounded in ethical conduct that accomplishes all of the aforementioned goals. What follows is a brief discussion of how the various methods of ethical reasoning benefit or hinder public administrators' ethical decision-making.

## Teleological Ethics and Equality

In a democratic form of government, the concept of "rule of the majority" is an accepted principle. According to May's theorem (1952), using a simple majority vote (50% plus one) is the fairest way to make decisions between two political alternatives due to the nature of its autonomy and neutrality. Based on this concept, it appears that teleological ethics would the approach to use for this situation because the concept of the greatest good for the greatest number (utilitarianism/consequences) would correlate well with majority rule. However, when you apply the concept of majority rule to the concepts of equality (equality of opportunity, equality of condition, and equality of result or outcome) or the concept of social equity, then teleological ethics (great good for the greatest number) does not seem to fare well because the statement of the greatest good for the greatest number implies that some will not reap the benefits.

However, there are advantages to using teleological ethics when making decision in the public arena. Rules can be rigid and some cases may warrant that some people be treated differently in society from others. A good example of this is how veterans are treated. People who serve their country are provided with certain entitlements for their service. People who are not veterans do not receive these entitlements, and this is looked upon as fair treatment of veterans for their service. If the government operated using equality of opportunity, then everybody would be allowed to participate in the military and qualify for veteran entitlements; however, due to the nature of the work the military does, not everyone is going to qualify to participate. In this situation a teleological approach to ethics would be advantageous to

the decision-making process because it addresses the issues of the consequences of allowing every person to participate, even if they were not medically qualified to perform the duties that would be required by military service.

## Virtue Ethics and Equality

The public administrator who makes decisions based on virtue ethics is not operating from a set of rules or higher principles so much as he or she is making decisions based on character, particularly the character of a virtuous person. In other words, the administrator will not ask what the rule is, but rather will ask the question, "What would a virtuous person do in this situation?" and will not easily be persuaded to consider a lesser standard of ethics.

As such, this person will be prone to support the concept of equality that he or she thinks a virtuous person would support. If the administrator thought that most virtuous people would at least support equality of opportunity, then that is the basic concept of equality that the administrator would support. The downside to virtue ethics is the administrator's ability to apply his or her desire to be virtuous with his or ability to be virtuous. This is where education, practice, and maturity are important.

There may come a time when conflict between the administrator's sense of virtue and the policy, procedures, standing operating procedures (SOP), the law, and even other virtues may put a constraint on making decisions based solely on virtue ethics. An example of when one virtue conflicts with another is when the administrator must decide between two programs, and regardless of the policy choice, some group will not reap the benefits of the policy and another group will.

## Deontological Ethics and Equality

As previously mentioned, there is within the deontological person an innate desire to perform his or her duty based on a higher set of principles, particularly universal principles, and these principles take on the form of a formal obligation, which takes precedence over methods of ethical decision-making, particularly the teleological approach to ethical decision-making. The important question is: How do we establish higher-order principles that are universal and adaptable to ethical decision-making in the public sector? A person operating from this perspective of deontological ethics would be supportive of the high-ordered principles of equality – equality of condition and equality of result or outcome – since these concepts of equality are higher-ordered principles of equality.

The disadvantage of using the deontological approach has to do with the higher-order principles and what determines their validity. Particularly, the issue of what higher principle to use when one does not exist for the situation would call for the development and adoption of a higher principle, and, due to the situation, there may not be time to develop this new principle. In addition, using deontological ethics calls for the administrator to be fully aware of most, if not all, of the higher principles the administrator would need in making decisions.

## Combined Approach to Ethics to Promote Equality

Based on the discussion of each of the approaches to ethics and relating them to the concept of equality, it is noted that each has advantages and disadvantages. In order to overcome the disadvantages of each and allow the administrator more flexibility when making ethical decisions, particularly when applied to equality, James Svara (2015) developed a model that combines all of the methods of ethical decision-making (teleology, virtue, and deontological approaches to ethics) with the concept of duty in order to promote a more comprehensive approach to ethical decision-making.

Svara, in his text entitled *The Ethics Primer for Public Administrators in Government and Nonprofit Organizations* (2015), posits the use of the *ethics triangle* in decision-making activities. The advantage to using this model over the other

approaches is the *ethics triangle* incorporates the advantages of teleology (consequences – the greatest good), virtue/intuition (focusing on character of a virtuous person), and deontology (principle, which promotes justice, fairness, and equity), with the concept of duty (serving the public interest). This combined approach is more comprehensive in nature and acknowledges that decision-making in the public sector is multidimensional and, as such, needs an ethical approach that is multifaceted.

## Conclusion

The concept of New Public Administration called for moving public administration beyond its focus not only on efficiency and effectiveness, but also on social equity. In order to move forward, another element must be added to the model of efficiency, effectiveness, and social equity, and that element is ethics. The approaches to ethics used in public administration need to be more closely tied to the concept of equality.

The approaches to ethics that dominate the literature focus mainly on teleology, virtue ethics, and deontology. Equality in a democratic form of government can take on several forms, including equality of opportunity, equality of condition, and equality of result or condition. In addition, the concept of equality is closely related to the concept of social equity as posited by the New Public Administration movement.

When relating the various approaches to ethics (teleology, virtue ethics, and deontology), it is clear that each of these approaches lend themselves, to ethical decision-making, but they also have disadvantages. Based on the nature of public administration and the notion that the discipline is dedicated to serving the public interest, a more comprehensive approach to ethical decision-making is needed in the public sector. James Svara (2015) posited a comprehensive model of ethical decision-making, *the ethics triangle*, which combines all three approaches to ethical decision-making while keeping at the heart of the decision-making process the concept of duty – serving the public interest.

## Introduction

In most sectors today, public, private, and nonprofit, the phenomenon of "good governance" has become an important goal as strategic plans and policy actions are put in to place. Ethics and ethics education are major factors in the achievement of that goal. In the field of public administration, the good governance concept includes the operational aspects of public agencies as well as the care and engagement of our citizens, all performed ethically and with good stewardship. This article suggests several options for reaching the intersection of good governance and ethics, as well as the existing issues which may prevent or delay getting there. The major questions to be explored by this research become: (1) what exactly is good governance and (2) how does the concept of ethics and the associated ethics education influence it?

## What Is Good Governance? A Working Definition

Good governance in public administration is the process of making the best possible decisions while using public resources. The concept is applied at all levels of government and across all facets of public administration, although the interpretation and method of application vary a great deal. There are several operational aspects included in the process of good governance, with accountability, transparency, effectiveness and efficiency, and ethical behavior, among the most noted items. Accepted norms within each society will determine the level of importance of these key factors, as well as the composition of them, but all of these items are sure to impact the public's assessment of accomplishing the goal of good governance.

*Accountability.* Public administration professionals must be accountable for his or her own actions and decisions in the workplace. Ideally, accountability is present at all levels of an agency, but it should be present with certainty in leadership roles. This could include the implementation of processes, selection of contractors, successful completion of tasks and assignments, as well as the shortcomings of getting the job done. Varying levels of internal and external controls are the key to addressing concerns of accountability. Internal controls include agency policies, procedures, and other governing documents. External controls include items such as audits and legislation, external items which lend themselves to public value.

*Transparency.* Transparency is the openness of operating transactions, with the intention of building and maintaining credibility and public trust. The key here is for the general public (or other stakeholders) to understand the choices and decisions made by public administrators and the inputs considered when making them. Avoiding conflicts of interest helps with this, but administrators must consider public perceptions of their actions.

*Effectiveness and Efficiency.* Government has to work, and in a perfect world, it should be done with maximum benefit to the citizenry. Effectiveness assesses the agency's achievement of its

mission and goals and the steps taken to achieve them. Efficiency is the provision of goods and services at the best prices, with the least possible cost of production.

*Ethical Behavior*. Ethics is the practiced behavior of right and wrong as well as the conscious decisions made concerning which path should be followed (Daft 2010). The current state of public administration and ethical behavior has been influenced by many facets of the public administration arena. As with the evolution of any process, there are reasons, causes, and effects that have molded the situation we see today. Several factors or phenomenon are now hitting the front pages of media, making ethics education a necessity instead of traditional optional course.

## Ethical Issues in Public Administration: Items that Affect Good Governance

As public administrators are required to conduct themselves ethically, the foundation upon which ethical conduct is enacted must first be present. No matter the profession, ethical practice requires adhering to an identified set of rules, regulations, or expectations, accepted as the standard or at the very least acknowledged by those in a given field, a commitment to do what is right. Various "codes of ethics" have been implemented by agencies nationwide, often introduced upon hire and subsequent annual follow-up. Let us discuss the issues that have created the need for such codes.

*Unethical Behavior and Occurrences*. The age-old reality of unethical occurrences in government has been an unfortunate truth for as long as organized government has existed – from the spoils system to Watergate and to modern-day conspiracy theories. History does seem to repeat itself, at least when it comes to the instances of fraud, waste, and abuse in government. Public sector ethics and a dedicated leadership team are the foundational elements in the ongoing charge of creating a more open and transparent government, to correct what has gone awry. Moving in the right direction requires public administration professionals to be "proactive" instead of "reactive," in the fight to eliminate corruption and unethical behavior and improve overall public image. Bowman and Knox expand upon the ethics challenges in today's local government agencies, as they discuss results of their 2007 public administrator's questionnaire. They state that 97% of respondents experience ethical dilemmas in the workplace (Bowman and Knox 2008). They continue by saying these respondents also believed that sound ethics can be enabling in agencies. Sure, some public agencies have established the "cookie-cutter" workplace ethics programs, but more is needed.

*Decision-Making, Improved Internal Controls, and Efficiencies*. As the need for accountability grows and as the public increasingly demands it, government agencies must improve upon operating efficiencies and accuracy. These improvements also require increased communication and transparency. Numerous cases and reports from national and international investigative bodies confirm that unethical acts are indeed a serious issue, with faulty internal processes being the gateway. Ineffective internal controls or a complete lack thereof in some cases can increase the opportunities for unethical behavior within an agency and cause incidents to go undetected until too late. According to the Association of Certified Fraud Examiners (ACFE), management reviews, reporting hotlines, and employee support programs are the most successful controls used in deterring fraudulent activity (Warren 2012). The National Performance Management Advisory Commission (NPMAC) states that governments must practice performance management to achieve results and improve public confidence. Their framework suggests management, evaluation, planning, and budgeting as key to the performance management cycle, with these items dependent upon sound internal controls to be both effective and efficient (NPMAC 2010). The Commission further supports the concept of accountability and controls by stating that (1) officials must be held accountable internally as well as to the public and (2) policies, strategies, and services by being effectively aligned (viii).

*Ever-Changing Public Service Environment*. Public administration has often been compared

to the private business environment, with many calling for a more stringent "business-like" approach to management. The role of the public administrator continues to change, as well as the types of agencies providing the actual services. The rise in public-private partnerships (PPPs) has in some cases blurred organizational boundaries, accountability, and responsibilities (Bovaird 2004), but is just one example of the changes to public service delivery. In this scenario, government agencies actually outsource the delivery of services to private entities, due to factors such as cost, capabilities, technology, and even location constraints for the coverage of citizens in outlying/rural areas.

## Ethics Education: Where Are We Now?

Moving forward to improved good governance models will take quite an effort on the part of local government entities. Grassroots changes to ethical foundations and leadership structures will be needed to have "doing the right thing" become embedded in the fabric of public administration. What will it take?

*Current State of Ethics Education*. Although NASPAA and other accrediting bodies do not mandate specific ethics course content for MPA programs, the regulations they set forth do however incorporate ethics and ethical decision-making into its mission, focus, and processes. At the core of the standards are public service values and accountability, as stated:

> The mission, governance, and curriculum of eligible programs shall demonstrably emphasize public service values. Public service values are important and enduring beliefs, ideals and principles shared by members of a community about what is good and desirable and what is not. They include pursuing the public interest with accountability and transparency; serving professionally with competence, efficiency, and objectivity; acting ethically so as to uphold the public trust; and demonstrating respect, equity, and fairness in dealings with citizens and fellow public servants. (NASPAA 2009)

Now clearly "acting ethically" leaves much open to interpretation, which is why conduct must be defined early on in the education process, before students become practitioners. The expectations are surely out there and are easily found, but it is the decisions we make that define acceptable or unacceptable ethical behavior. We know what the rules are, but whether or not we choose to follow them is a completely different issue. Bowman suggests we begin with the basic textbook, as he discusses the ethics content currently contained in the 12 public administration texts examined in his 2001 study. He states that the texts all include at least some, albeit minimal, combination of his four pillars of ethics: (1) value awareness, (2) reasoning skills, (3) the role of the law, and (4) strategy implementation (Bowman et al. 2001). We go to Cooper and Menzel's framework for ethical competence (Cooper and Menzel 2013), which suggests that educators should follow four steps to begin this process: (1) select a textbook with sufficient ethical content; (2) have students write provisional ethics statements; (3) educate students in all schools of ethical thought, even those that conflict; and (4) have students actually critique a code of ethics for the field of public administration.

Professional associations are also stepping up to lead the charge, by requiring the acknowledgment and adherence to its ethical standards mandatory for membership. The American Society for Public Administration (ASPA), for example, has adopted a code of ethics consisting of eight principles (revised in 2013), which expressly states expectations for ethics and integrity, as well as practices for implementation of these principles (items six through eight quoted here):

Demonstrate personal integrity. Adhere to the highest standards of conduct to inspire public confidence and trust in public service.

Promote Ethical Organizations: Strive to attain the highest standards of ethics, stewardship, and public service in organizations that serve the public.

Advance Professional Excellence: Strengthen personal capabilities to act competently and ethically and encourage the professional development of others

(ASPA 2013)

E

The International City/County Management Association (ICMA) is another such organization, which has set forth twelve tenets for members to uphold. Members are expected to be:

> Committed to equity, transparency, integrity, stewardship of public resources, political neutrality, and respect for the rights and responsibility of elected officials and residents strengthens democratic local governance. (ICMA 2013)

Many agencies have a standard ethics training module or program, administered by the human resources department. Some actually have a separate ethics committee that sits within individual departments, to directly address ethics-related issues. The goal here is to have rules and regulations that reflect the best ethical conduct, leaving no lines blurred internally. Public service agencies at least in theory strive for productivity and efficiency, but does a productive end justify unethical means? Absolutely not! Just because you are reaching for a noble cause, does not mean you can get there unjustly. To address this, organizations often define their idea of ethical behavior as well as the path to be followed to achieve it. Are these programs successful? Future studies will surely determine, but they would undoubtedly be more successful if ethics were the foundation at the academic level.

## Ethics Education: Moving Forward

The public sector landscape has also transformed due to new ideologies in public management theory, the "reinvention" of government, such as new public management (NPM). NPM is designed to reduce government costs by privatizing and competing public services (Kolthoff 2007) and is guided by two principles: managerialism and market orientation (14). These two identify a variety of areas for potential change or improvement, including leadership responsibilities, productivity as a foundational element, quality control, information systems, contracts, and market analysis as well as appropriate performance management (14). Kolthoff goes on to define ethics as the standards of human conduct that are often considered separately from an organization's daily operations (37–38), but our current state surely shows that these must be intertwined moving forward, infusing ethics into every stage of the governing and service delivery process.

Ethical standards must indeed be established, but the "moral compass" of the individual must also be vigilant. It all begins with the educational program. What is needed is more definitive suggestions on how it can be stopped before happening at all – moving from detection and mitigation to prevention strategies. Why not change this dynamic by making ethics training the foundation of public service and business education programs? An answer to this question would require educators in schools of public and business administration to be proactive by eliminating the sources of unethical conduct and corruption by developing the students' character. While company-required ethics education programs can provide the foundation for appropriate workplace conduct, behavior, and outcomes, the kind of permanent change envisioned here may require a deliberate and robust addition of ethics into academic coursework. It can be argued that in-depth ethics instruction, sound decision-making skills for internal controls, documented and enforceable guidelines, as well as concerted effort can make ethics and ethical decision-making the foundation for leaders in the public sector.

Preparing future public administrators requires education and training early on in the academic process and ideally, prior to the influences of work environment. Many schools and programs of public administration offer basic ethics courses but much more needs to be accomplished, as many of these courses still remain elective instead of required for program completion (Menzel 1997). Scenarios specific to public administration leadership should be introduced, but the pedagogy should also incorporate basic ethical principles that apply to both the public and private sectors.

*Leadership and Decision-Making Preparation*. Thompson believes that ethics should be instilled in and taught to all officials at all levels of government, which is crucial to their role in American democracy (Thompson 1992).

Furthermore, he states that three main paradoxes make this quite the arduous task, hindering the process of ongoing ethics education: (1) the perceived importance of government ethics, (2) the difference between one's personal ethics and public ethics, and (3) the appearance and reality of right and wrong (255–258). As an industry we must arm future public servants with the tools of ethics before their tenure begins, instilling such values from the beginning and not depending on the on the job training. It must be second nature, alongside the daily business tasks, infused in the decision-making process for public administrators. The ethical tone for an agency is often set by the leadership, so they must possess the necessary skills.

*More Complex Ethics Pedagogy.* With no specific ethics course mandates guiding public administration programs, we must be sure that future offerings on the subject of ethics include all facets of the topic (where possible) and establish the solid foundation and system infusion of the ethical processes. We must move from basic ethics education to a model of what Jurkiewicz identifies as "ethical competence." To educate ethical future public administrators in ethical competence, she suggests the following framework as the basis for course content: (1) an understanding of moral arguments and moral philosophies, (2) the ability to separate true management issues from ethical issues, (3) the ability for logical reasoning, (4) the ability to separate personal ethics from professional ethics, and (5) the ability to perform ethically under pressure (Jurkiewicz 2013). These items definitely provide a solid methodological approach to ethics education, going beyond the traditional basic definitions.

Cooper and Menzel suggest several outcomes for ethics coursework, in line with Jurkiewicz's suggestions, that could possibly be incorporated into all programs of study. Their concept suggests five categories of ethics knowledge necessary for a deeper understanding of ethical behavior: (1) the commitment to higher standards behavior, both personal and professional; (2) the knowledge and understanding of ethics laws and codes; (3) the ability for ethical reasoning and decision-making; (4) the acknowledgment of public service values and ethics; and (5) the ability to promote ethical behavior and ethical practices in public agencies (2013). All disciplines that train public servants would benefit from such an in-depth look at ethical behavior, making it a part of standard operations instead of a topic to review when things go wrong.

E

## Summary

What is now required is a collaborative effort between citizens and administrators for the future of the participation process. As noted previously within this discussion, the area that lies between public services provided by local government and those provided by private business is quite gray, as service delivery methods and customer base are overlapped. The needs of the citizen must surely be the focus, along with the efficient use of resources to meet those needs. This fine balance must be accomplished to achieve both the policy agenda and the social agenda, which will be no easy feat. Public trust and ethics structure that provides its foundation (either positively or negatively) must be improved and nurtured by participation and transparency.

All organizations strive to achieve long-term success and sustainability, especially public organizations dependent on perceived effectiveness and public value. This begins with the well-laid plans of meaningful activities that support a sound and insightful organizational mission. The key to orchestrating such a scenario is the knowledgeable and well-equipped leadership team. They must demonstrate the necessary personal and professional skill sets to interpret the organization's needs, create objective plans of action, and effectively communicate the information to others, for effective and successful implementation.

The ultimate goal of public agencies is to maintain viability while ensuring longevity and realizing the office's future vision. They must continue to create significant and lasting public value – the

society's vision of success (Bryson 2011). Anchored by sound ethics, an established and communicated mission, and well-educated and trained public administrators, successful public agencies must fully integrate the core concepts of good governance into the everyday operations and internal processes.

Accessing mental health services; Ethics; Mental health equity; Mental Health Parity and Addiction Equity Act; Mental health policy; Patient Protection and Affordable Care Act

## Definition

Ethics and Mental Health Policy: Duties, principles, and obligations directing the actions or guidelines of government or public entities pertaining to and prescribing how a person, organization, or other official party should respond to an individual based on that individual's cognitive, behavioral, and emotional condition or well-being.

## Introduction

Safeguarding the rights and ensuring privacy and protection for individuals experiencing mental illness are responsibilities that public officials and governing entities encounter routinely. Public officials are challenged to establish procedures and processes for responding to those with mental health disorders because the decisions they make are complicated by the need to weigh the interests of competing groups and constituencies, the reality of insufficient resources, and the absence of defined structures and policy. Still, paramount to any policy action to respond to those suffering

mental illness is the need for ethical and principled decision-making and standards. Such standards must effectively balance protections for the public and the individuals who are suffering mental illness while simultaneously adhering to professional practices and standards of care that some believe are in need of redress.

Fundamental to any discussion of mental health policy ethics is a review of those issues that create professional dilemmas, namely, our view of those with mental health conditions, issues of parity, health inequities, and the ambiguous and conflicting nature of some laws and regulations. Herein, we explore the challenges associated with mental health policy ethics and provide guidance for students, practitioners, administrators, and those policy-makers who have the responsibility of articulating or implementing approaches, policy, or governance structures in the context of public systems.

## Defining Mental Illness

### Prevalence and Classifications

Mental illness is the leading cause of disease burden in the United States and one of the top contributors to premature death among adults (Kaiser Family Foundation 2017). Mental illness or a mental disorder refers to a health condition that affects an individual's emotional or psychological well-being and causes challenges in daily functioning. In 2016, about 44 million adults over the age of 18 had a mental illness – about 18% of the US population (SAMHSA 2017). The most common mental illnesses among adults are anxiety disorders, major depression, and post-traumatic stress disorder (PTSD) (National Institute of Mental Health [NIMH] 2017). Mental illness prevalence rates among adolescents are also a concern, with 13–20% living with a diagnosable mental disorder (Kaiser Family Foundation 2017). Among adolescents, attention deficit hyperactivity disorder (ADHD) is the most common disorder (Kaiser Family Foundation 2017). A more vexing classification of mental illness is serious mental illness (SMI). SMI applies to adults 18 years and older who have a diagnosable mental or emotional disorder that causes substantial impairments in engaging in daily functioning (NIMH 2017). In 2016, 4.2% of US adults had SMI (SAMHSA 2017). The most common SMIs are severe mood disorders such as bipolar disorder and psychotic disorders such as schizophrenia.

### Special Populations

Many theories of mental health treatment have focused on addressing biological, social, or environmental factors separately, but new approaches often focus on the complex biopsychosocial nature of mental health. People with multiple mental disorders or co-occurring disorders – having both a mental illness and a substance use disorder – present a unique challenge to adequate diagnosis and treatment. Slightly more than 3% of adults meet the criteria for having a co-occurring disorder (SAMHSA 2017).

Although mental illness is common, it disproportionately affects certain populations. Veterans, people who are incarcerated, homeless individuals, and racial and ethnic minorities experience higher rates of mental illness than the national average. American Indian/Alaskan Natives have the highest prevalence of adults experiencing mental illness at 22%, followed by Whites, Hispanic/Latinos, and then African Americans (NIMH 2017). Veterans are at an increased risk of developing a mental illness. Veterans who serve in combat are substantially more likely to be diagnosed with PTSD and experience lifelong symptoms. Veterans who have served in Iraq or Afghanistan have a higher rate of PTSD than the civilian average, with rates between 11% and 20% (U.S. Department of Veterans Affairs 2016). Of all incarcerated individuals at the local, state, and federal level, between 44% and 65% are living with a mental illness (Kaiser Family Foundation 2017). Mental illness rates among the homeless are particularly high, with 25% of the population living with a SMI, and almost 50% have either a mental illness or a substance use disorder (Kaiser Family Foundation 2017).

## Mental Health Parity

### False Distinctions: Differentiating Mental and Physical Health

Historically, our views of mental health and how we treat people who are mentally ill have not been on par with our approach to physical illness. Physical health disorders have been perceived as conditions suffered by an individual that are beyond his or her control. In contrast, mental disorders (particularly behavioral and emotional conditions), from the untrained perspective, were long viewed as issues that an individual has agency over and are within his or her ability to arrest. Complicating matters is the long-standing debate concerning the social construction of mental illness and a disregard for seeing it as a disease. Additionally, unlike those experiencing physical health conditions, individuals who are mentally ill are seen less sympathetically; we fear the potential actions and behaviors associated with the individual's condition. Our lack of understanding of mental illness is very much a factor in the reality that mental health rights and protection laws and the legalization of health parity have been slow to come.

**Mental health laws and legislation**. In general, mental health laws are intended to protect the rights of those who are experiencing a mental health condition, or they govern the practice, response, and conduct of those individuals and professionals who treat or interface with those who are mentally ill. In the United States, mental health laws vary state to state, but at the national level, there are rules and regulations that provide funding and/or give guidance about rights, protections, and care. They include the Protection and Advocacy for Mentally Ill Individuals Act of 1986, Rehabilitation Services Act, Patient Protection and Affordable Care Act of 2010, Americans with Disabilities Act, Individuals with Disabilities Education Act (IDEA), Children's Health Act of 2000, Fair Housing Act, Garrett Lee Smith Memorial Act, Mental Health Parity and Addiction Equity Act of 2008, Tribal Law and Order Act, and the 21st Century Cures Act of 2016 (including provisions of the Helping Families in Mental Health Crisis Act that was introduced in the 114th Congress). For a review of federal laws and regulations pertaining to mental health, see the Substance Abuse and Mental Health Services Administration (SAMHSA) website (https://www.samhsa.gov/about-us/who-we-are/laws-regulations).

### The Ethics and Legality of Disparate Care

**Parity**. The road to establishing parity in how employers, health-care insurers, and health-care providers respond to and treat physical and mental health is interwoven with our history on mental health policy ethics. The heart of the matter concerns a fundamental question: Is it ethical to provide care, coverage, and treatment for physical health at a level not commensurate with what is provided for mental health? Prior to the Mental Health Parity and Addiction Equity Act of 2008 (MHPAEA), which was strengthened by the 2010 Patient Protection and Affordable Care Act (Obamacare), insurers could limit mental health care, providing less benefits and coverage as compared to medical and surgical care. Arguably, such a practice of inequity in care is not ethical and now as a result of the law is no longer legal.

**Disparities**. Another aspect of care that relates to the ethics of mental health policy concerns the disparities associated with access and treatment. Again, the fundamental argument is whether unequal access to care and treatment is ethical. Ethnic minorities in the United States faced with the same needs do not receive the same access, level of care, and quality of care as their nonethnic counterparts (McGuire and Miranda 2008). Efforts to close the gap in care, reduce disparities, and improve care outcomes are reflected in the current public agenda.

## The Current State of Mental Health Policy Ethics and Research

### Access to Care and Service Delivery Provisions

Accessing adequate mental health services is an integral part of managing and treating mental illness. People with mental illness are uninsured at higher rates and often do not have all their mental health needs met. In 2016 fewer than half

of adults with any mental illness (AMI), 43%, received mental health services (SAMHSA 2017). This rate was higher for individuals with SMI, with 65% receiving treatment (SAMHSA 2017). These statistics have stayed mostly stagnant over the past decade with only 41% of adults with AMI receiving services in 2008 (SAMHSA 2017). Of people who utilized mental health services, 20% reported not all of their mental health needs were met (Mental Health America 2018). Among individuals with a co-occurring disorder, almost half did not receive either comprehensive mental health care or substance use services (SAMHSA 2017). Youth are also at an increased risk of not receiving adequate mental health services – almost 65% of adolescents with major depression did not receive care in 2014 (Mental Health America 2018). The most common services received by patients were prescription medication and outpatient services (SAMHSA 2017). Most outpatient centers provide crisis response, individual and group therapy, and prescription medication. Inpatient service utilization is less common and largely used by people with an SMI who have bipolar disorder or schizophrenia or who are experiencing a major depressive episode.

### Adequacy and Affordability of Care

Again, the Patient Protection and Affordable Care Act and the Mental Health Parity and Addiction Equity Act (MHPAEA) require health insurers to cover mental health and substance abuse treatment at the same level as other medical services. It also extends this requirement to health insurance purchased on the marketplace and to Medicaid users. However, even with these two critical laws, inability to pay is still cited as the number one reason people do not receive treatment (Kaiser Family Foundation 2017). A quarter of individuals report lack of affordability or that services were not covered by insurance as the main barriers prohibiting them from obtaining mental health care (Kaiser Family Foundation 2017). Almost 90% of all mental health centers accept major health insurances, including Medicaid, but 17% of adults with AMI lack health insurance (SAMHSA 2016a; Mental Health America 2018).

Higher rates of being uninsured also affect children with mental illness. Eight percent (8%) of youth do not have health insurance that covers mental health services (Mental Health America 2018). Likewise, readmission rates are important in understanding the effectiveness of care received. Out of patients who were discharged from the hospital because of a mental health episode, 13% were readmitted within 30 days (Kaiser Family Foundation 2017). This rate is higher among individuals with severe mental illness, with 22% being readmitted within the same time frame (Kaiser Family Foundation 2017).

## Expanding Bioethics: Mental Health Policy Ethics

### Bioethics

The practice frameworks, values, moral principles (autonomy, nonmaleficence, beneficence, justice, fidelity, veracity), and the professional code of ethics of psychologists, psychiatrists, social workers, and other behavioral and mental healthcare professionals help them to tackle ethical issues. However, given the trends in today's service delivery systems, particularly an emphasis on integrated care (primary and mental health care), the diligence to safeguard privacy, and the need for treatment equity, bioethicists would be wise to consider a new focus. Williams (2016) urges bioethicists to expand their long-standing base of inquiry to consider the right to treatment and access to quality care. Indeed, one of the modern challenges facing public administrators and others entrusted with the responsibility of implementing public policy and administering public mental health funding is the ethical dilemmas posed by the lack of access and quality of care. Likewise, today's bioethicists working with public administrators and others trusted with safeguarding the public's interests must confront ethical dilemmas that strike at the core of the issue, namely, the need to distinguish between mental health, mental illness, and severe mental illness and to plan accordingly a dilemma that contextualizes modern ethical challenges.

## Decision-Making and the Intersection of Mental Health Law, Public Policy, and Ethics

### Looming Ethical Challenges

Ethical mental health policy practice today directs our attention to several critical issues, including the following.

**Prioritization of the needs of the seriously mentally ill**. Ethicists, policy-makers, mental health practitioners, patients, families, public administrators, and other stakeholders must determine the proper level of investment in three competing categories of care: mental health, mental illness, and severe mental illness. Although it is important that there be a level of care and response for all, the prevailing disagreement concerns the lack of urgency and prioritization of the needs of the seriously mentally ill.

**Financing, resource allocations, and access to care**. There is a need for more investment in hospital care, housing, monitored medication assistance, rehabilitation, and case management for those with serious mental illness. Many people question the ethics and injustice of our current system in which the seriously mentally ill do not receive proactive intervention in care settings but instead cycle through jails, prisons, diversion, emergency rooms, and various conditions of homelessness. Ethical care is targeted care, when policies and programs broaden access to care and support, including Medicaid coverage for inpatient care, housing, supported activities, and medication.

**Treatment approaches**. Mental health stakeholders disagree about the type of treatment that should be used to support people suffering mental illnesses. Ethicists are challenged to mediate the prevailing beliefs that a "recovery model" should be the approach versus those who believe that the model is misguided because it ignores the disease nature of mental illness. Rigorous debate about the lack of evidence in recovery models abounds. How one frames the causes and nature of mental illness addresses the core issue of the type of intervention that is viewed as appropriate. Those who subscribe to the disease model view such approaches as assisted outpatient treatment (AOT) as viable, given that there is evidence showing that AOT leads to a reduction in hospitalization and the collateral damage of homelessness, arrest, and incarceration.

**Politicization of mental illness**. Another competing stakeholder interest currently being debated concerns whether there is a need for more stringent gun control policies versus greater identification and control of those who are suffering mental illness as a response to mass violence and shootings. Although individuals who have a mental illness are more likely to be victims of violence than they are to victimize, the prevailing rhetoric is seemingly pitting gun rights against the framing of mental illness. Mental health policy practitioners and ethicists must stay engaged in the dialogue to keep the needs of the mentally ill from becoming politicized.

**Laws and court involvement in treatment**. The therapeutic nature of mental health courts, the training of law enforcement to distinguish between criminal and psychotic behavior, and responsive commitment laws (the effective balancing of public safety, an individual's need for treatment, and personal liberties) are measures and practices that policy-makers and administrators can endorse, as they strive for ethical decision-making. The battle cry that is often heard is "mental health reform." Effective policy reform requires alignment of multiple stakeholders' efforts, collaboration, and coordinated articulation of goals that are driven by mental health ethics.

## Conclusion

Mental health practitioners can look to a myriad of ethical decision-making models to guide their work, but macro-practitioners, including policy analysts, public administrators, public officials, and other decision-makers, may not have tools and guideposts that are readily available. Complicating matters for the macro-practitioner is the need to balance the interest of multiple and competing stakeholder groups. Mental health policy ethics is even further challenging because of the fundamental disagreement about the nature of the

disease itself (including whether it is indeed a disease), scapegoating and politicization of the needs of those who are mentally ill, and issues surrounding the management of and competition for resources. Likewise, treatment access and quality of care are issues made even more daunting by the fact that nationwide, there is a shortage in nearly every mental health occupation, and education and training programs are not producing the number of graduates needed to replace an aging and retiring workforce.

Moreover, technology-based mental health care and monitoring and the electronic sharing and management of health information and records, intended to broaden care and ease administrative burden, usher in an entirely new set of ethical challenges. Ultimately, macro-practitioners will do well to consider ethical decision-making models that are informed by a value of shared and participatory processes. Finally, mental health policy ethics should be guided using analyses that respond to resource scarcity and economic trade-offs by considering treatment efficiency and effectiveness, prioritization of the needs of those who are sickest, and the need to address entrenched and prevailing disparities.

## Glossary

**Adequacy** Adequacy refers to the quality of care people are receiving to treat their mental health disorder. Of people who accessed treatment, 20% reported that not all of their mental health needs were met or that treatment did not adequately address all their needs (Mental Health America 2018). Barriers to receiving adequate care include lack of insurance, not enough mental health-care providers – especially in rural areas – and gaps in care such as not receiving comprehensive outpatient services (Mental Health America 2018).

**Anxiety disorder** Anxiety disorder symptoms are characterized by intense distress and prolonged feelings of being overwhelmed, worried, or fearful of a non-threatening situation (NAMI 2017a). "Anxiety disorders exist when anxiety symptoms reach the point of frequency and intensity that they cause significant impairment" (USDHHS 2005, p. 26).

**Assisted outpatient treatment** "Assisted outpatient treatment (AOT) is the practice of delivering outpatient treatment under court order to adults with severe mental illness who are found by a judge, in consideration of prior history, to be unlikely to adhere to prescribed treatment on a voluntary basis. AOT is a form of civil commitment intended for those who suffer from anosognosia (lack of insight) in addition to severe mental illness, and have been repeatedly hospitalized or arrested as a consequence of treatment nonadherence" (SAMHSA National Registry of Evidenced Based Programs and Practices 2015, p. 1). Most often, it is the frequent users of services who are targeted to receive AOT. Studies have shown that individuals experience positive outcomes including improvements in treatment engagement and reduction in hospital stays (Munetz et al. 2014; Van Dorn et al. 2010).

**Attention deficit hyperactivity disorder (ADHD)** This is the most common diagnosed mental illness among adolescents (Kaiser Family Foundation 2017). ADHD is defined as "A persistent pattern of inattention and/or hyperactivity-impulsivity that interferes with functioning or development" (DSM-V 2013, p. 1). Individuals with ADHD often exhibit behavior characterized by the inability to focus on one task, trouble listening, and difficulty following directions (DSM-V 2013). People with ADHD are often easily distracted and may avoid engaging in mentally challenging tasks (DSM-V 2013).

**Bioethics** A field of study and a set of activities intersecting medicine, policy, science, politics, and law concerning questions and challenges addressing how we act, view, recognize, or respond to a host of human health issues. In the Encyclopedia of Ethics, bioethics is framed as the "broad terrain of the moral problems of the life sciences, ordinarily taken to encompass medicine, biology, and some important aspects of the environmental, population, and social

sciences. The traditional domain of medical ethics would be included within this array, accompanied now by many other topics and problems" (Reich 1995, p. 250).

**Bipolar disorder** "A person with bipolar disorder cycles between episodes of mania and depression. These [manic] episodes are characterized by a distinct period of abnormally elevated, expansive, or irritable mood" (USDHHS 2005, p. 26). Symptoms of bipolar disorder include racing thoughts, not sleeping for prolonged periods of time, engaging in risky behaviors, and excessive drinking (USDHHS 2005).

**Co-occurring disorder** A co-occurring disorder is diagnosed when a person has a mental health disorder and a substance use disorder (SAMHSA 2016b). Persons with a mental illness are at an increased risk of misusing substances (SAMHSA 2016b). Treating individuals with a co-occurring disorder is challenging as individuals experience multiple symptoms and differences in severity of each disorder (SAMHSA 2016b). Homeless individuals, people who have been incarcerated, and veterans are at an increased risk of developing a co-occurring disorder (SAMHSA 2016b).

**Disparate** Referring to differences in care or treatment. "Mental health care disparities, defined as unfair differences in access to or quality of care according to race and ethnicity, are quite common in mental health" (McGuire and Miranda 2008, p. 1). Ethnic minorities are more likely to receive poor or inadequate care compared to nonethnic minorities (McGuire and Miranda 2008). Disparities can develop from lack of health insurance, poor treatment, or bias and discrimination on behalf of the health-care provider (McGuire and Miranda 2008).

**Major depressive disorder** Depression is one of the most commonly diagnosed mental disorders (NIMH 2017). It is characterized by prolonged feelings of sadness or hopelessness. "Instead of just feeling 'down,' the client might not be able to work or function at home, might feel suicidal, lose his or her appetite, and feel very tired or fatigued. Other symptoms can include loss of interest, weight changes, changes in sleep and appetite, feelings of worthlessness, loss of concentration, and recurrent thoughts of death" (USDHHS 2005, pp. 25–26).

**Mental health disorder prevalence** The prevalence of mental health disorders refers to how many people have a diagnosed mental disorder within a given population. The United States has a mental health disorder prevalence rate of around 18% for adults (SAMHSA 2017). However, certain racial/ethnic minorities, homeless individuals, veterans, people who are incarcerated, and other special populations experience higher prevalence rates of mental illness (SAMHSA 2017).

**Parity** Referring to fairness or equality between mental health services and medical health services. The Mental Health Parity and Addiction Equity Act [MHPAEA] was passed in 2008. Under MHPAEA, health insurance groups are required to provide the same financial assistance and coverage for treating mental health and substance use disorders that they provide for treating medical and surgical health conditions (CMS n.d.).

**Post-traumatic stress disorder (PTSD)** Commonly diagnosed in people who have experienced a traumatic life event, such as assault, combat, a natural disaster, or other life-threatening situations. Common symptoms include sleep disturbances, re-experiencing the trauma, and developing a mood disorder (NAMI 2017b). PTSD has a higher prevalence rate among the veteran population (U.S. Department of Veterans Affairs 2016).

**Readmission** Readmission refers to how often people with a mental illness return to a service facility to receive treatment after being released from care. Out of patients who were discharged from the hospital due to a mental health episode, 13% were readmitted within 30 days (Kaiser Family Foundation 2017). This rate is higher among individuals with severe mental illness, with 22% being readmitted within the same time frame (Kaiser Family Foundation 2017).

**Recovery model** A treatment philosophy pronounced during President George H. Bush's

New Freedom Commission on Mental Health era where the prevailing belief was that with supportive services and treatment, those suffering mental illness can assume an independent life. Patients' rights proponents embrace the recovery model. Some define the recovery model as an approach to treatment that enables the individual to maintain control and personal agency, not adhering to the often unattainable goal of premorbid functioning. The complete eradication of symptoms is not the goal in the recovery approach, and such is believed to be unnecessary for adequate functioning (Jacob 2015).

**Schizophrenia** "This is one of the most common psychotic disorders and one of the most destructive in terms of the effect it has on a person's life" (USDHHS 2005, p. 25). Common symptoms include hallucinations, the inability to manage emotions, delusions, and disorganized speech (USDHSS 2005). Treating schizophrenia often requires a multitude of treatment approaches, including medication, inpatient services, and therapy (NAMI 2017c).

## Resource Sites

**Federal and State Roles in Protecting Those with Mental Illness** (http://www.mentalhealthamerica.net/issues/federal-and-state-role-mental-health)

This website provides a summary of federal legislation and regulations, federal protections, federal role in funding services, federal role in research, and states' roles in mental health.

**Guide to VA Mental Health Services for Veterans & Families** (https://www.mentalhealth.va.gov/docs/MHG_English.pdf)

This guide is from the Department of Veterans Affairs. It is a comprehensive guide for military veterans and their families on how to access mental health services.

**Olmstead Act** (http://www.mentalhealthamerica.net/positions/community-inclusion-after-olmstead)

This site reviews content related to the Olmstead Act and efforts to protect and expand community inclusion for those with mental disorders.

**Mental Health Disparities**

The National Institute of Mental Health (NIMH) has a minority health and mental health disparities program. Also, for more information about the topic, see the 2012 National Disparities Health Care Report (https://archive.ahrq.gov/research/findings/nhqrdr/nhdr12/index.html). See the National Partnership for Action (http://www.npa-rhec.org/home) for a review of federal data sources pertaining to healthcare disparities.

**Mental Health Parity and Addiction Equity Act (MHPAEA)** (https://www.cms.gov/cciio/programs-and-initiatives/other-insurance-protections/mhpaea_factsheet.html)

The Centers for Medicare and Medicaid Services through its Center for Consumer Information and Insurance Oversight provides a summary of the regulations, protections, and exceptions resulting from the Mental Health Parity law.

**Mental Health Resource Guide for Individuals and Families** (http://www.mentalhealthministries.net/resources/resource_guides/Hope_Resource_Guide.pdf)

The report provides a description of common mental illnesses and how to utilize mental health services.

**Navigating a Mental Health Crisis: A NAMI Resource Guide for Those Experiencing a Mental Health Emergency** (https://www.nami.org/About-NAMI/Publications-Reports/Guides/Navigating-a-Mental-Health-Crisis)

Produced by the National Alliance on Mental Illness, the report discusses how to assist oneself and others who are experiencing a mental health emergency.

**Regulations.gov** (https://www.regulations.gov/)

Public-facing website that enables tracking of federal regulations and laws

**21st Century Cures Act** (https://docs.house.gov/billsthisweek/20161128/CPRT-114-HPRT-RU00-SAHR34.pdf)

This law (signed on December 15, 2016, by President Obama) was expedited by bipartisan support. The law ushers in major changes related to mental health, biomedical research, brain research, and regulation of drugs and medical devices.

## Synonyms

Corporate governance; Organizational ethical environment

## Introduction

Considerable media attention has been paid to the consequences of unethical business practices and decision-making over the past two decades. Since 2004 until 2013, approximately US$7.8 trillion has exited emerging economies unlawfully through unethical actions and practices (Global Financial Integrity 2015). Illegal activities, such as smuggling and money laundering, are excluded from this amount, which implies that the total is much higher. This figure also fails to consider the costs associated with losses incurred in terms of employer reputation and brand and those sustained as a result of reduced output and productivity linked to lowered levels of employee morale, engagement, and motivation. In addition, the negative consequences of a systematic culture of unethical behavior can be severe and include customer boycotts, fines, lawsuits, and government regulation of an organization's practices (Robbins and Judge 2013).

Maintaining ethical standards while maximizing stakeholder value is critical for organizations. Identifying and eliminating the sources of unethical conduct and practices may be challenging. Although unethical behavior is, at times, attributed to the workings of a few "bad apples" in the organization, mounting evidence alludes to the complexity of the concept of ethics and ethical conduct. The role played by the individual personal value system needs to be balanced against the influence of organizational culture and other environmental considerations (Mayer 2011).

Organizational culture plays a significant role in the promotion of ethical conduct. Consideration should therefore be given to how this context is created and maintained. To establish an organizational culture that promotes ethical conduct, it is important to ensure that policies and procedures, which outline acceptable behavior and standards, are set in place. It is important that ethical expectations beyond those outlined in the organization's policies are communicated. Thereafter the considerations of Mayer (2011) become important. The author identifies three interconnected aspects of an ethical environment that are aimed at promoting ethical behavior. These aspects are ethical leadership, ethical practices, and ethical climate.

**Ethical leaders** influence their followers to do the right thing rather than doing things right. These leaders model the ethical behaviors expected from employees and ensure that decisions are fair and in the best interest of the employer and other organizational stakeholders (Lloyd et al. 2014).

Aligned with ethical leadership is the importance of engaging in **ethical practices**. Research indicates that there are six critical organizational practices relating to ethics: recruitment and selection, orientation and training, policies and codes, reward and punishment systems, accountability and responsibility, and decision-making (Mayer 2011). Lastly, the **ethical climate** can be described as the general perception employees have regarding the ethicality of an organization.

Maintaining an ethical organization offers multiple benefits. It is generally believed that ethical organizations perform better in terms of market value over time. Additional benefits include higher productivity and profitability, improved investor confidence, attracting and retaining talent, and contributing to an organization's competitive advantage. These benefits emphasize the need to create and sustain an ethical culture and being recognized as an ethical organization. This chapter will investigate the concepts of organizational culture and ethics and will recommend practical steps to develop, encourage, and uphold an ethical organizational culture.

## Concepts Defined

**Organizational culture** may be referred to as "a pattern of shared basic assumptions that the group learnt as it solved its problems of external adaptation and internal interaction that has worked well enough to be considered valid and therefore to be taught to new members as the correct way to perceive, think and feel in relation to those problems" (Schein 2004). Elements of organizational culture include (Bibb 2010):

- Commonly held stated and unstated values
- Implicit and explicit expectations about the behavior of its employees
- Customs, stories, and rituals
- The history of the organization and its members
- Commonly used language
- The physical space
- Metaphors and symbols that are an intrinsic part of the organization and how it works

Organizational culture can serve as an informal regulator of behavior (Bibb 2010). It provides employees with a sense of identity, increases their commitment, reinforces the values of the organization, and shapes the behavior of employees.

Many definitions have been proposed for **ethics** in an organizational context. It concerns doing what is right, even if unethical behavior is legally acceptable. It entails ensuring that decision-makers consider all stakeholders when taking decisions. According to Schoeman (2012), an ethical organizational culture implies that employees make decisions by considering all stakeholders, organizational values, laws, and rules. Creating and sustaining an ethical organizational culture requires a common understanding among employees of ethics and its implications.

For the purpose of this chapter, an ethical organizational culture can be described as shared behavior, norms, rules, and values that are inherently honest among employees in an organization. The main aim of establishing an ethical organizational culture is to improve performance, achieve common goals, and establish relationships with all stakeholders.

## Changing the Ethical Environment

When developing an ethical organizational culture, it is insufficient to merely establish and implement a code of ethics. Practical interventions are required to improve the ethical culture of an organization. These interventions include top management and supervisors acting as ethical role models to employees, ethics training for employees and managers, the appointment of an ethics officer, the implementation of a whistleblower policy, and implementing a reward system for engaging in ethical behavior. A systematic approach should be adopted in developing or reinforcing ethical organizational culture. This chapter will take a practical approach to the exploration of this topic and will attempt to develop a "real-world" system for developing an ethical organizational culture. The four phases discussed below outline the major steps in implementing or creating an ethical culture through the introduction of the aforementioned interventions.

## Phase 1: Formulate Ethical Strategic Values

Organizations are comprised of people with diverse backgrounds, educational levels, and value systems. Due to these differences, it cannot be assumed that all individuals will act and react in the same manner and be virtuous in all circumstances. High ethical standards among an organization's members will be evoked by an organizational culture which is high in risk tolerance, low to moderate in aggressiveness, and focused on means as well as outcomes (Robbins and Judge 2013). It is therefore critical to provide employees with guidance in terms of the desired ethical behavior. It is also important to have a common set of organizational values which underpin the ethos of an ethical organization which pervade all aspects of organizational culture (Lloyd et al. 2014). Organizational values provide the basis for how employees are expected to behave and the manner in which tasks should be completed in an organization (Schein 2004).

According to Robbins and Judge (2013), the following cultural characteristics are used by organizations to express their organizational values:

*Innovation and risk taking*: The degree to which employees are encouraged to take risks and be innovative

*Attention to detail*: The degree to which employees are expected to exhibit precision, analysis, and attention to detail

*Outcome orientation*: The degree to which management focuses on results or outcomes rather than on the techniques and processes used to achieve those outcomes

*People orientation*: The degree to which management decisions take into consideration the effect of outcomes on people within the organization

*Team orientation*: The degree to which work activities are organized around teams rather than individuals

*Aggressiveness*: The degree to which people are aggressive and competitive rather than easygoing

*Stability*: The degree to which organizational activities emphasize maintaining the status quo rather than growth

An organizational culture exhibiting the aforementioned characteristics has a long-term perspective and focuses on balancing the rights of multiple stakeholders, including employees, shareholders, and the community (Robbins and Judge 2013). The following section will examine the creation of vision through leadership and the role of leadership in developing an ethical organizational culture.

## Phase 2: Creating a Vision Through Leaders

As previously mentioned, organizational leaders play a key role in setting the climate of the organization. Ethical leadership promotes ethical conduct by not only practicing, but managing ethics and holding employees accountable for their actions. Furthermore, leaders must add to and prompt the formulation of organizational ethical policies, communicate organizational ethical codes of conduct, and lead by example. Leaders thus play a critical role in creating, establishing, and maintaining an organizational culture (Werner 2016).

Top management commitment is critical in institutionalizing ethical behavior. It is not only the actions of senior management that need to reflect this commitment, but also all communication between leadership and employees.

Management teams need to display a value-based leadership style. Value-based leadership involves a practice aimed at instilling and developing "sound values by considering the personal interests and degrees of power held by people within an organization" (Prilleltensky 2000). Leadership is based on the assumption that vested interests and social power influence the promotion of certain values. Taking this into consideration, leaders should be cognizant of the organization's mission statement and ensure that the values articulated therein are examined in view of the subjective, interpersonal, and political processes which promote or inhibit the realization of an organization's vision (Prilleltensky 2000). Managers should be guided to focus not only on *what* the goals are that need to be achieved, but also *how* they arrive at them. The implementation and maintenance of an ethical organizational culture requires leaders who portray, through both their verbal and nonverbal actions, the principles of ethical management.

Organizations that have successfully implemented an ethical organizational culture have leaders who demonstrate involvement and commitment to the field of business ethics and are "visibly ethical." Therefore, the leader's role is to create the ethos of the organization and set the standards. If leaders are unsuccessful in the implementation of ethical systems, various challenges may arise.

## Phase 3: Implementation Interventions

There are a number of interventions which can be implemented in the workplace to promote, support, and maintain an ethical organizational culture. For an ethical environment to prevail, the Ethics Resource Centre (ERC) has adopted several specific elements based on the Federal Sentencing Guidelines for Organizations (Lloyd et al. 2014). These are written ethical workplace conduct standards, ethics standards training and orientation, advice about workplace ethics, telephone lines, email addresses or websites, opportunities to confidentially or anonymously report violations of ethics standards for all

employees, regular performance appraisals that incorporate ethical conduct evaluations, the disciplining of employees who violate ethics standards, and a set of stated values or principles to help guide employee behavior. It is proposed that the following interventions are considered when attempting to improve the ethical culture of the organization.

*Socializing employees*: Socialization into an organization can impact on a new employee's work productivity, commitment to the organization's objectives, and retention (Lloyd et al. 2014). Organizational socialization is defined by Robbins and Judge (2013) as "a process that adapts employees to the organization's culture." The process comprises three stages: pre-arrival, encounter, and metamorphosis.

The **pre-arrival stage** recognizes that the new employee enters with his/her own pre-existing set of values, attitudes, and expectations, both about the job and the organization. The new member then advances to the **encounter stage** where expectations about the job, co-workers, boss, and the organization are either confirmed or rejected. To reconcile differences in terms of expectations and the reality discovered during the encounter stage, new members must thereafter adapt by passing through the **metamorphosis stage** to fit into the organization (Robbins and Judge 2013). This process of cultural integration is when the new employee accepts and adopts the new (organizational) culture, values, attitudes, manners, and customs.

*Conduct an ethical climate assessment*: Focus groups and surveys are commonly used by organizations to determine employees' views of management, the organization, ethical dilemmas, and the possible causes of unethical practices.

*Compiling a code of ethics*: Increasing awareness of the consequences of violating legal or ethical standards has led to the implementation of codes of ethics that prescribe standards of behavior that are expected from employees. A code of ethics is a document that outlines the values, principles, and behavior that management wishes to both encourage and prevent in its business activities. A written code of ethics provides a solid framework for building a moral and ethical organizational culture. With this framework organizations attempt to guide employee behavior through the establishment of formal value statements, mission statements, credos, policies, and codes of ethics. Fostering an ethical environment, discouraging unethical behavior and providing support in dealing with ethical problems are made easier by having a well-developed code of ethics in place. It is also important to ensure that the code is enforced fairly and without exception throughout the organization to avoid a loss of legitimacy and the code being perceived as being "for show" (Werner 2016).

*Ongoing communication*: Ethical behavior is not guaranteed simply by the existence of a code of ethics. Transparency and consultation among all stakeholders are crucial in the development and communication of an ethical code. All members of the organization must receive the values and ethics messages communicated by the organization. Meetings and functions should be used by managers and supervisors as opportunities to talk about ethical dilemmas and issues as well as to celebrate successes. This ensures that employees are aware of the important link between ethics and organizational success.

*Whistle-blowing*: A critical aspect of enforcing desired values and behavior is providing a suitable outlet for employees to report unethical behavior. Whistle-blowing is defined as the act of exposing information about employees or managers who commit acts that are illegal or unethical, provide poor value for money, or endanger the health and safety of employees or other stakeholders. Retaliation or victimization for their disclosure is a common fear among whistle-blowers. These fears can be reduced by affording protection to whistle-blowers via the organization's code of ethics and making use of an ethics officer to ensure confidentiality.

*Provide ethics training*: Ethics training provides an opportunity for employees to discuss and exchange views on the importance of ethics in daily work issues. Implementing or reforming an ethical culture is not possible without some form of ethical learning and training. Without implementation of ethical training, attempts to promote business ethics in organizations will

undoubtedly fail. Organizations need to consider the type of training and the timing and methodology thereof (Robbins and Judge 2013). All employees should be provided with baseline training as well as ongoing ethics education and training programs. Ethics training should commence as part of formal orientation training for all new employees and maintained through continuous interventions. This will ensure that the expected ethical standards and behavioral actions of employees are known and understood by all stakeholders.

However, ethics training, as with other interventions, cannot function in isolation. It needs to be integrated with organizational values, policies, orientation, and training and development programs. However if an individual's value system is in opposition with the organization's values, individuals cannot be trained to be ethical. A high degree of overlap and uniformity of values between the individual and the organization is necessary for ethics training to be successful.

During these training programs, opportunities to discuss relevant ethical dilemmas in a non-threatening and supportive environment should be provided. Various resources should be available to assist and guide employees when exposed to unethical practices. The ability of employees to make ethical decisions is vital. Various models on ethical decision-making have been developed including Rest's (1986) four stages of ethical decision-making, the issue-contingent model by Jones (1991), the issue-risk-judgment model by Tan (2002), Crossan et al.'s virtue-based orientation (VBO) model (2013), the Woiceshyn model, and the sensemaking model of Thiel et al. (2012). These models will be briefly explained, including their contribution to training individuals to make ethical decisions.

### Rest's Four Stages of Ethical Decision-Making

Rest (1986) identifies four chronological stages of ethical decision-making. These stages commence with the moral agent recognizing that he/she is dealing with a moral issue (Stage 1). Thereafter the agent is required to make a moral judgment on the issue (Stage 2). Once judgment has been made, the agent must establish the moral intent in regard to the issue (Stage 3). Lastly, the agent must act on their intent (Stage 4) (Tan 2002).

### The Issue-Contingent Model: Jones

Building on Rest's (1986) four-stage model, Jones (1991) introduces the issue-contingent model. This model proposes that ethical decisions made by the moral agent largely depend on the characteristics of the issue at hand. Moral intensity is understood as the unique features of the moral issue being addressed. The issue-contingent model states that moral intensity will vary according to the issue presented, and this variance will be influential at every stage in the process of ethical decision-making. Jones (1991) suggests that moral intensity influences moral intent and, by extension, how moral agents behave.

### Issue-Risk-Judgment Model: Tan

Jones' (1991) issue-contingent model was further built upon by Tan (2002) to produce the issue--risk-judgment model. This model focuses on contextual factors surrounding the moral issue, without considering the role of the decision-maker (Jones 1991). The issue-risk-judgment model emphasizes the importance of the decision-maker in examining the perceived risk and moral judgment of individual decision-making.

### The VBO Model: Crossan, Mazutis, and Seijts

The virtue-based orientation (VBO) model of ethical decision-making includes three primary components. First is the virtuous mean, in which individuals' decisions are an attempt to "be at their very best." Second, VBO proposes the ability of the individual to deepen character strengths through self-reflection. The VBO model adopts a circular sequence in taking into account the continual learning that takes place when individuals reflect on ethical or unethical conduct. Lastly, the VBO model introduces the notion of a buffering role in proposing that individual character does not play an overriding role in employee decision-making, because "good" individuals are sometimes willing to commit "bad" acts under specific circumstances (Crossan et al. 2013). This suggests that character strengths cannot be understood as

fixed, but may be dependent on the demands of a particular situation.

### The Woiceshyn Model

This model identifies two levels of processing and interaction which take place between the conscious and subconscious levels during the decision-making process (Woiceshyn 2011). Processing refers to a rational level of decision-making, where the ethical issue is identified. Interaction then guides the individual with prescribed steps to take. These steps include the following: Suitable moral principles must be identified and applied to the issue by searching through the decision-makers' subconscious mind for relevant information on principles relevant to the issue they are facing. If the relevant information is provided, these principles are applied to the issue faced by the individual, both in thought and in action. The interaction guides the individual against acting on emotion and prescribes a series of steps to be taken. This information is filed in the subconscious memory; ready to be recalled when a new dilemma is encountered by the individual (Woiceshyn 2011).

### Sensemaking: Thiel, Bagdasarov, Harkrider, Johnson, and Mumford (2012)

Sensemaking is a high-level cognitive process that individuals engage in when faced with complex and high-risk situations. Navigating ethical dilemmas requires identifying and recalling multiple pieces of information as well as the application of intuitive judgment in evaluating the potential outcomes (Thiel et al. 2012). Ethical events are multifaceted and go beyond purely rational models to those that address intuitive and interpersonal components as well.

An understanding of the value that each model provides can contribute to the development of skills and tools to respond to various ethical situations and assist employees in resisting the temptation to behave unethically.

*Appoint an ethics officer*: Organizations often appoint an older and respected manager to take on the role of counseling younger employees in regard to career problems, organizational difficulties, and ethical issues. The ethics officer may also assume this role in addition to his/her normal job. An ethics officer is able to identify ethical issues and create platforms where these issues can be confronted and discussed; this can be achieved by holding meetings and creating "chat rooms" on the organization's intranet. Resources linked to the appointment of an ethics officer include a centralized hotline where employees can anonymously seek advice on ethical matters and lodge ethical complaints. A hotline is considered a key organizational tool in maintaining and putting into effect ethical standards and providing clarity on any ambiguities that employees may face.

*Assessment of interventions*: The efficiency and effectiveness of ethics initiatives, training programs, and other infrastructural support needs to be constantly evaluated. This can be achieved through surveys, focus groups, and interviews with managers.

The following section will discuss the reinforcement of ethical organizational cultural behaviors and examine how behavior is shaped and rewarded.

## Phase 4: Reinforcement of Ethical Organizational Cultural Behaviors

Reinforcement theory proposes that individuals engage in behaviors producing positive outcomes and avoid behavior which produces a negative outcome. The reinforcement theory acts as a useful managerial tool by reinforcing positive behavior which produces better performance from employees (Werner 2016).

To create, promote, and reinforce an ethical organizational culture, it may be regarded as appropriate to reward laudable instances of ethical behavior. At the same time, it is essential that unethical behavior is investigated and appropriate sanctions applied. In terms of reinforcing the need for an ethical organizational culture, it is critical to send out the message that ethical behavior is essential to the optimal functioning of the organization.

Rewards for ethical and punishment for unethical behavior need to be consistently applied to all employees at all levels of the organization.

The reward system is of vital importance in instilling and maintaining an ethical culture as it contributes to the alignment or misalignment of individual behavior with cultural systems and values (Werner 2016).

An ethics-focused reward system may be described as a formalized system to promote, measure, and reward ethical behavior. Reward systems provide guidance on expected behavior and reflect the values of the organization. It is therefore critical that organizations reward the right behavior to ensure alignment between the reward system and aspects of ethical culture. It has been found that employees will behave in the way they are incentivized to; thus it is crucial that reward systems are examined by managers to ensure that desired behavior is reinforced. Generally ethical behavior is expected and accepted; and therefore rewarding it could be complex. However, in the long term, ethical behavior can be rewarded by promoting and compensating employees who perform well, as well as those who have develop a reputation of integrity among customers, peers, subordinates, and managers.

Employees can be held accountable for their ethical conduct by incorporating ethics as a measurable standard in performance management systems, thereby making evaluation of ethical compliance an explicit part of decisions regarding compensation and promotion. For individuals to advance in the organization, they must remain focused on both the organization's bottom line and on ethical performance.

## Conclusion

Through examination of the phases of creating an ethical culture outlined in the chapter, a better understanding of how organizations can improve their ethical standards is provided.

Phase 1 revealed that it is critical to provide employees with guidance regarding the desired ethical behavior in formulating ethical values. Phase 2 emphasized the importance of organizational leaders in changing culture to be more ethical through their commitment, behavior, and allocation of resources. Phase 3 highlighted that it is essential to expose employees to strategies to improve their decision-making skills. Phase 4 focused on the importance of instilling and maintaining an ethical culture by reinforcing ethical behavior.

The value orientation of the organization influences organizational performance, effectiveness, and ethical functioning. Values such as product and service quality, financial results, and strong brand reputation are central to improving organizational effectiveness and performance.

There are a number of managerial implications regarding ethical organizational cultures. Improving the ethical functioning of an organization requires that management show visible support thereof. This support is indicated by the leader's personal commitment to the process through facilitating the implementation of the aforementioned interventions, allocating resources for the various interventions, and acting as an ethical role model.

Training is imperative to assist employees in identifying ethical dilemmas and making ethical decisions. Therefore, resources need to be allocated by organizations to these programs.

There are multiple advantages to being seen as an ethical organization such as improved brand and business awareness and recognition; easier access to capital, lower cost of capital, and new sources of finance from ethical investors; enhanced employee commitment and customer loyalty; and the recruitment of top talent (Schoeman 2012). However, potential disadvantages include higher costs associated with utilizing "ethical" supply chain partners and higher overheads incurred in the training, communication, and monitoring of ethical policy. Despite this, creating and maintaining an ethical organizational culture is in the best long-term interests of an organization and is clearly the only way forward in terms of sustainable business practices.

Leadership; Norms; Organizational culture; Transparency; Values

> Errors are produced by inconsistencies in governing values that underlie the strategies of action that human beings use to actualize their values. The key to understanding human action is through these designs or theories of action. If humans repeatedly act differently from their stated goals, it is important to re-examine the underlying values for a possible mismatch or error. (Agryis 1994)

## Introduction

In recent years, there have been numerous national organizational scandals that have called into question organizational integrity, ethics, and accountability. Though daily news reports contain a discouragingly high number of examples of local agency malfeasance, on the national stage, the fall from grace of three venerable institutions captured the public's attention for a considerable length of time: Penn State, the Catholic Church, and the Boy Scouts all involved egregious lapses of judgment that exposed serious organizational malfunctions. From the public's perception these organizations were worthy of respect, held in high esteem, and, until the very public scrutiny of their administrative failures, had been valued for their contributions to society.

In the quote above, Chris Agryis (1994) suggests that organizational failures can be the result of employees' inability to align their values and actions – and in retrospective examination, this disconnection can easily be observed when scholars and researchers contemplate how it is possible for organizations to lose their moral compasses and jeopardize losing the public's trust. The public is dismayed and shocked when these failures occur, often vowing to sever their support and demanding some form of apology or organizational reform. The ethical failures at Penn State and the Catholic Church have been explored from a number of viewpoints, including the perception that both institutions were prone to function in a "top-down" culture, where those below "walk on eggshells" and avoid challenging the status quo for fear of recrimination or backlash (Barth 2012, p. 635) Powerful administrators set the tone for these top-down organizations, often making it clear that their decisions, sacred traditions, or

cultural norms are not to be challenged. These organizations are also characterized by their ability to minimize threats, circling the wagons in an effort to protect their own. As part of their quest to better understand this phenomenon, researchers acknowledge the obvious benefits realized if organizations were more interested in prevention strategies, shining a light on potential weaknesses and attempting to recognize ethical failures before damage is inflicted. Absent the crystal ball, organizations must rely on more traditional safeguards – increased oversight, the application of codes of ethics, processes for reporting or "whistle-blowing," and intentional efforts to insure transparency. These traditional safeguards are not guaranteed to prevent the kind of ethical pitfalls witnessed in the public and nonprofit sectors, but they do indicate some awareness of the threat and a willingness to align values with action.

## The Risks and the Remedies

The art of "doing ethics" is having the ability to think more systematically "about the values and principles that are embedded in our choices than we do when we make choices on practical or political grounds alone" (Cooper 2012, p. 3) "Doing ethics" is often characterized as a very simple mindset, suggesting it only requires a touchstone like the Golden Rule learned in kindergarten. We are cautioned by Hart (2001) to set aside that notion and appreciate that "ethics is a most demanding discipline" that requires serious contemplation. The definition of "administrative ethics" provided by Svara (2007) seems simple to digest but between the lines is assuredly more complex to implement, assess, and monitor:

> Ethics refers to well-based standards of right and wrong that prescribe what humans ought to do, usually in terms of duties, principles, specific virtues, or benefits to society. (p. 10)

## Performance, Pride, and Peace of Mind

### Does an Organization's Ethicality Have Any Impact on Performance Measures?

One attempt to answer the question might be found in this analysis of one agency's efforts to address its ethical culture and make the necessary changes needed to impact performance. A statewide child welfare agency had reached a tipping point in terms of job satisfaction, turnover, and dysfunctional relationships. Utilizing the Low and High-road compliance strategies (Bowman and West 2015) the agency serves as an illustration of the contrast between the two strategies and highlights a few of the more common consequences endured by employees working in ethically compromised agencies. For years the agency, like so many others in the country, had been plagued by turnover, low morale, and a revolving door of administrators, including those in the very top positions. Additionally, fiscal resources were unevenly distributed and opportunities for training and personal development were scarce. Frontline workers, tasked with some of the most complex decision-making in public service, suffered from the twin burdens of high caseloads and mountainous layers of paperwork. The unrealistic demands of excessive caseloads and bureaucratic processes propelled a steady stream of defectors, moving out of the field and into work considered far less stressful. This perfect storm for agency malfunction created scapegoats of the frontline workers who were constantly looking over their shoulders, fearing culpability in the aftermath of a tragedy, in spite of the agency's accountability in perpetuating such a toxic environment.

Historically, this agency had engaged in the double standard (Bowman and West 2015) described as the individual blame (bad apple) against the institutional innocence (the barrel) (Trevino and Youngblood 1990). This low-road compliance strategy emphasized blame and punishment and an overriding emphasis on the avoidance of external scrutiny and litigation. Outside of their offices, employees talked to one another about their efforts to manage their caseloads and work with at-risk families under the increasingly stressful circumstances. At this level of organizational dysfunction, researchers have identified a number of conditions that manifest within the workforce, many of which were described by the Department's frontline staff: anxiety, diminishing self-esteem, insomnia, and PTSD (post-traumatic

stress disorder) (Jurkiewicz and Giacalone 2016). Adding to the internal elements causing stress and anxiety for workers are the more common external pressures associated with child welfare work – the expectations that workers will not make errors in judgment about children's safety and risk public ridicule and scorn. Child Welfare agencies are routinely taken to task in the news media, and their reputations negatively impacted. This adversely affects the already embattled workforce, with some research suggesting that the reaction to such excessive exposure to stress is an increase in unethical behavior within the agency (Greve et al. 2010). In Child Welfare agencies, unethical behavior can surface as workers taking shortcuts – an effort to function within mandatory timeframes with a focus on two of the three elements of the "Holy Trilogy" – efficiency and effectiveness (Menzel 2007, p. 10). These shortcuts carry considerable risk yet many in Child Welfare lament that the pressures are extreme and expectations too high, creating an environment and a culture that is way too vulnerable to mistakes and dysfunction.

As many professionals in other organizations looked on with mounting concerns for the department and its personnel, the governor appointed a new director – someone with considerable experience in Child Welfare. Slowly, under new leadership, the department began to address its cultural issues, including the propensity to place blame at the feet of the very individuals who were quite literally making life and death decisions against the backdrop of a punitive and distant administration. With enough time at the helm to sort out many of the agency's organizational missteps and malfunctions, the director made a commitment to the workers that seemed to embrace the concepts of a high-road strategy focusing on reform and improvement rather than fear and sanctions. Speaking to a large gathering of staff, and streaming live to many others, he declared a new day in the department where the administration would "have your back" if workers followed procedures and were ethical in word and action. This signaled the beginning of the end of an era of throwing workers under the bus and exculpating the organization. Though too early to know if this significant shift in ethical culture will produce the desired effects, i.e., less turnover, stability, and an increased trust between front line workers and administration, initial response has indicated a growing appreciation for the administration's recognition of the complexities of child welfare roles and responsibilities. To put this in organizational culture terms, the desired response for this Child Welfare Agency, or any other facing similar issues, would be increased performance outcomes that are fostered by a heightened sense of integrity and ethical behavior at all levels in the institution and an organizational culture that is built on mutual trust and support.

Organizational culture has been examined throughout the evolution of Public Administration, with perhaps too great an emphasis on the rogue employee rather than the influence of an unethical culture. Borrowing from the business field, Frederick (1988) aimed his lens on culture early on as a significant source of an agency's dysfunction and questionable ethics, characterizing a company's culture as the "seedbed of misbehavior" (p. 49) Frederick's perception of ethical climates also considered what can occur in the absence of personal morality, social responsibility, and even something as simple as a "caring attitude" (p. 49). Without encouraging these qualities as factors in decision-making, agencies are more likely to engage in behaviors that the public would consider objectionable. Burke and Black (1990) also considered the disproportionate emphasis in agencies on the Holy Trilogy to the exclusion of a second set of E values – evaluation, empathy, and ethics – considered vital ingredients to enhancing human factors and strengthening the organizational environment and increasing productivity (p. 122). Burke and Black's discussion of this second set of E values offers an interesting perspective on what employees constitute as ethical concerns in their organizations. In their survey of Rotary members in California and Texas, the respondents overwhelmingly ranked honesty/integrity as the most pressing ethical concern, suggesting, according to the researchers, that this might be a place to focus when considering how ethics can be utilized to improve performance (p. 130).

The link between ethics and performance has been substantiated in other public service

agencies, most notably in Menzel's surveys of city and county managers in Florida and Texas (1992, 1993, 1995). Asking the question "Do ethical climates of public organizations reinforce or detract from organizational values such as efficiency, effectiveness, excellence, quality and teamwork?" Menzel sought to learn how these managers perceived their ethical climates, focusing on the "perceptions, attitudes, and cultural forms concerned with right and wrongdoing behaviors (1995, p. 250). Looking at the results of the surveys, Menzel posits that municipal organizations that prioritize ethical environments are in a better position to successfully serve their communities than those agencies who neglect this element of their organization (p. 257). Both Menzel (1995) and Burke and Black (1990) echo Bowman's (1983, 1984) contention that organizations where ethical behavior is taken seriously are more likely to develop environments that are conducive to building trust. In addition, these factors also mitigate against the emergence of unethical behavior: "Organizations that provide men and woman with the opportunity to work in an environment which values and nurtures a reputation for integrity are the surest ways to deal with miscontent, increase productivity and safeguard against corruption" (Bowman 1984, p. 48).

## Conclusion

Returning to the question at the beginning of this section, it seems fair to suggest that a concerted effort to minimize if not eradicate organizational dysfunction can result in a more productive, healthy, and motivated workforce. The development of an ethical infrastructure goes beyond the previously stated traditional safeguards to include Bowman and West's (2015) building blocks in ethics management: organizational structure, values statements, psychological contracts, oaths and codes, managing institutional ethics, and creating ethical competency (p. 147). These building blocks are strategies that organizations can implement not only in an effort to increase performance but to address other organizational challenges such as turnover, morale, and mission adherence. Discussing the link between ethics and performance, Geuras and Garofalo (2011) recommend that ethics initiatives must be part of a comprehensive strategy to address the major issues facing contemporary organizations (p. 324). Further, the authors suggest that there is no confirmation that the field has answered the question "What difference do organizational ethics make?" but the normative and logical case could be made that "well-conceived, well-organized ethics initiatives, with follow-through, can make a real difference in organizational, professional, and personal performance" (p. 327).

To do nothing would be tantamount to leaving a can of gasoline next to matches – neglecting ethics opens the door for deception and dysfunction. As Bowman and West (2015) caution, "Although an effective system will not produce perfect people, an inadequate system will produce wrongdoers" (p. 147). Too many institutions have paid the price for neglecting the development of an ethical culture – and the public may not always be forgiving.

# Ethics and Philosophy

Jennifer L. Eagan
California State University, East Bay, Hayward, CA, USA

## Synonyms

Epistemology; Ethics; Governance; Metaphysics; Morality; Philosophy; Political theory; Theory

## Definition

Ethics and Philosophy are humanistic fields of inquiry that ask questions about right action and the nature of truth, reality, and meaning.

## Introduction

This entry reviews the intersections of ethics and philosophy with public administration, public policy, and governance including philosophical and ethical questions that arise in political theory and practice. The first section poses ethical questions as they apply to policy and the political, reviews normative theories of ethics and their application to administration and governance, and explores two key issues (administrative evil and whistle-blowing) in detail. The following section explicates the interdisciplinary intersection of philosophy and political practice, including a review of influential schools of philosophical thought. The entry concludes with a reflection on the importance for ethics and philosophy for creating and evaluating sound and democratic political practices.

## Ethics and Governance

As interdisciplinary fields of inquiry, public administration, public policy, and governance certainly engage with and draw from multiple areas of inquiry and academic disciplines. The fields of political science, sociology, and management are perhaps the most obviously relevant. However, there is a strong theoretical and philosophical component to public administration, public policy, and governance which informs the practices of creating and administering policy. For example, some philosophical questions that arise from the practice of governing are as follows: How do we define "good" policy? What is the nature of power? Who should have power, and how should it be distributed? How can policy be legitimate? What constitutes "good" government? What is justice? What defines a legitimate democracy? Who is subject to the law, and which laws are they subject to? What sort of entities are human

beings? How can they work in concert? What should be the aims of humans working in concert? Should government be representative, and if so, how should it be? What constitutes "the people"? How can we discern what the will of the people is? Should public officials always enact the will of the people? Should public administrators always follow the will of legislators in implementing the law? Should public administrators follow their consciences or another set of principles in performing their work?

In addition to these questions of governance, there are more specific questions surrounding policy of an ethical nature, or what policy should do and what aims it should have. What role should government play in the lives of citizens? What is the ethics of taxation? Should business be regulated by government, and if so, how much and when? What is the duty of policy makers and administrators to the environment, to future generations? Is it the role of government, if any, to create social equity and gender equity? Eradicate racism? Equalize the economic classes?

Ethics, in the philosophical sense, or normative ethics, can be thought of as the study of the possible theories and principles that should guide right action, ways of thinking about and determining right action. The philosopher Immanuel Kant considered ethics to be the branch of philosophy that answers the question, "what should I do?" Ethics within the frame of policy and governance can be thought of answering the question of what we should do collectively. Metaethics, or the study of and defining of ethical terms, such as the "good," the "right," and the "just," is also necessarily entwined with normative ethics. There are metaethical questions surrounding issues of governance such as what those metaethical terms, "good," "right," and "just," mean when applied to the structures of government, policies, or governing practices. Applied ethics involve the specific application of these theories and ways of thinking to issues within specific areas of inquiry, such as business, administrative, biomedical, or environmental ethics.

Ethics is distinct from codes of professional ethics and standards. The study of ethics considers multiple perspectives on what constitutes right action, and the study of ethics would also necessarily entail the critical questioning of codes of ethics, even if they are mandated.

## Normative Approaches to Ethics

### Virtue Ethics

Generally attributed to Plato and Aristotle, virtue ethics associates right action with a state of the soul and the intellect, indicating that good actions are indicative of attempts to develop processes (thinking and behavior) that emanate from one's character and guide one to right action. Plato thought that the proper ordering of the soul and its orientation toward eternal truths rather than the material or temporal would guide one to right action. In the *Republic*, Plato indicates that the state of soul, its tripartite nature containing reason, spirit, and appetite, determines whether or not someone acts in a just manner. Unifying the different aspects of the soul and pointing the soul in the right direction is what produces good character and, therefore, right action.

In Aristotle's version of virtue ethics, articulated in the *Nicomachean Ethics*, the aim of all human behavior is happiness. Aristotle claimed that habit, a deliberate repetition of actions that direct one to a mean between extremes, constituted right action. For example, bravery is the mean between cowardice (the deficit of bravery) and foolhardiness (the excess of bravery). For Aristotle, that mean of right action is relative to the individual; with respect to bravery, what is virtuous action for a firefighter is not the same as virtuous action for a child.

Applying virtue ethics to public policy and governance is difficult, since the measure of virtue ethics is interior, about one's thinking and the comportment of one's soul. That's difficult to discern in public space. However, often, through policy, government officials encourage citizens to act temperately, for example, to not litter or to not drink and drive, and in doing so appealing to their sense of personal integrity and discipline. However, as an individual form of ethics, virtue ethics can be applied to individual public actors who act according to their own measure of virtue. So, does it matter to the practice of governance, creating or administering policy, whether or not the practitioners are virtuous or that they enact the will of

the people, creating good results through their actions, and being technically proficient? Is virtuous character a necessary precondition for the good actions and results of public officials? Citizens often claim to want public officials with character, but are skeptical about the character and motives of public officials.

### Utilitarian Ethics

Right action, according to any utilitarian ethics, should secure the greatest good of the greatest number of stakeholders or those affected by the action. Utilitarian theorists can differ with respect to what they consider the "good" that we are securing for the most involved to be. John Stuart Mill considered it to be happiness, as defined by the presence of pleasure and the absence of pain. The thinking involved in utilitarianism is individual, but aimed toward the collective. One stakeholder's happiness is considered to be equal to every other's. Utilitarian ethics requires us to consider others' interests as at least equal to our own in any decision-making process.

In contrast to virtue ethics, utilitarianism has a collective component and is more easily applicable to public affairs, so it is frequently appealed to in making policy and administrative decisions. If a policy can secure the good for the most number of people, then it is the right policy. This seems obvious as the object of policy and government should be to create the good for the collective of citizens. However, this rather simple formula may leave out important considerations, such as more universal ethical principles, constitutional restrictions, and minority rights.

However, despite its collective focus and relative ease of application, utilitarianism has some serious liabilities. First, how do we determine the universe of stakeholders? We know in the past that the experience of women and people of color has explicitly not been considered in discussions of the public good. This may lead to the question of who are we excluding now, trans people, nonhuman animals, future people who do not yet exist? These populations may be included in future versions of utilitarian calculus in making policy decisions and arguably should be included now. The universe of whose experience counts and is included or excluded is not obvious and can change over time. Second, do certain principles have general utility or do we only consider the utility individual acts? Bentham would claim that principles should be secondary to the consideration of whether or not individual actions create the greater good for the greater number. John Stuart Mill would claim that certain principles, such as freedom of expression, secure the greatest good in the long run even though in the short term the effects may seem harmful. Even though certain political speech can seem dangerous, freedom of speech supports freedom of conscience and the competition of ideas in public spaces, which has greater overarching utility for humankind than suppression of such speech. Thirdly, some version of the good that relates only to the experience of the entities affected by a decision may not take into account important principles or values that those entities also consider important.

### Deontological Ethics

The root of deontological ethics refers to the Greek word "deon" or "duty." Unlike virtue ethics or utilitarianism, the aim of action is not happiness or flourishing, but rather acting according to a universal principle that should hold true in every case. The most prominent deontological ethicist is Immanuel Kant. He claimed that right action should be determined according to a universal ethical principle that is generated by an individual use of reason that we would hold universally. By applying the categorical imperative as the founding ethical principle, we ask ourselves how we would act if acting only according to principles that we could will universally, not only in this instance and not only for ourselves but in all cases and for all rational actors. In other words, we act according to a universal principle that we generate through our own use of reason. It is the following of the universal moral law that constitutes right action, not securing good ends or results. Actions inspired by a desire for happiness, favorable results, or anything besides respect for the universal law itself are not properly speaking ethical action.

Deontological ethics' strengths are that it requires us to act according to reason rather than

our prejudices and preferences for certain people. If we dispassionately apply a universal law, we may be able to avoid our preference for people who we know personally or people who are like us (like people of our same race). Also, through the application of universal principle, we may avoid rationalizing our actions by appealing to the ends or results created as a justification for unjust means. One of the problems with deontological ethics is that it is difficult to find genuine universal principles that we would will to apply in every case. For example, the principle of always protecting human life sounds rational and universalizable; however, in real-life application, we tend to make certain exceptions for when we act in self-defense or when we exclude certain kinds of human lives from the principle, such as certain felons or enemy combatants. Further, deontological theories of ethics require us to exclusively use reason and abandon our human ethical sensibilities and emotional impulses, such as empathy, which may positively inform our actions. Deontological ethics also asks us to ignore our concern for positive results from our actions, for ourselves, and for other people, in favor of a fidelity to reason.

Deontological ethics is based on individual thinking and conscience, so it is difficult to apply to public actions. However, clearly many principles that we apply to governance appeal to universal values that everyone should hold, and public officials often appeal to these values when their decisions do not seem to appeal to the will of the people (like when asserting the civil rights of an unpopular minority) or create good results (like when waging war). The governing perspective of constitutionalism clearly takes a deontological perspective, asserting constitutional principles as inherently rational universal principles that must be applied evenly in every case and that constitutional principles take precedence over democratic will and what might be favorable for society. The clearest application of a deontological ethics to a theory of government is the work of John Rawls, in *A Theory of Justice* (1971), where we must separate ourselves from our own interests in order to think properly about how to establish a just society by donning a "veil of ignorance" and considering how we would construct a just society if we could not know our place in it.

### Existentialist Ethics

Existentialist ethics begins with the presumption that all human beings are free to create themselves through their actions. This ethics stems from the claim of a fundamental human freedom, not only that human beings should be free in the social and political sense but that human beings are fundamentally free by virtue of their ontology, the sort of beings that they are. This freedom means that human beings are free from the bounds of human nature and any eternal authority, whether God or reason. Any values or principles adopted by an individual are their own and justified solely by their choice. Existentialist ethics is not nihilism, the claim that there are no values and therefore no possible systems of ethics, but rather a claim that ethical values are generated by human beings and have no other source or justification.

Clearly, existential ethics is deeply individualistic and not easy to apply to any collective form of ethics of action, including governance. However, if one thinks that the character or motive of public officials leads to good action, one might want such officials to connect themselves, who they are, to the actions that they conduct on behalf of the public. Arguably, such a perspective could assist in avoiding pitfalls of unethical behaviors in public life, such as administrative evil (discussed below). The existentialist insight that values, including public values, are generated by human beings means that they can also change and are contingent on human beings upholding them.

One problem with applying these Western philosophical traditions to matters of public policy is that they all focus on how an individual should approach the question of right action rather than on how individuals could act collectively to secure right action and a good society. Often, applying these perspectives to group action rather than individual action is complicated and can be a poor fit. For example, how could a government or public agency become what it chooses to be through its actions? Generally, we don't think of countries or public institutions as having agency in the same sense as an individual. Or, what

happens when a group of decision-makers cannot agree on who are the parties affected by a decision and therefore cannot agree on the application of utilitarian ethics because there is fundamental disagreement on whose happiness counts in the calculus? We may be able to see how a public agency can act according to principles that it has laid out for itself in a constitution, set of bylaws, or mission statement, but not how such an agency develops those principles collectively in the first place. As shown in the examples above, it is often incumbent on the theorist applying the ethical approach to modify it in order to apply it to collective action.

Obviously, there are many religious-based codes and systems of ethics, and the debate of whether and how these traditions should be included in the practice of governance is alive and well in the USA. The scope of this article will only cover ethics in the philosophical sense.

## Two Key Ethical Issues

### Administrative Evil

Beginning with the work of Hannah Arendt in *Eichmann in Jerusalem* (1963) and influenced by the social psychology of Stanley Milgram and Philip Zimbardo, the study of evil in institutional and administrative settings has been an actively studied ethical issue. Administrative evil is the act of harming others within the context of an organization which supports that wrongdoing, both creating the conditions where the evil can take place and providing the sense that individual responsibility can be avoided. Given the many historical and contemporary instances of atrocities being instigated by public officials within their professional roles and carried out by administrators just following orders, this issue is clearly an important and contested one.

Though the Holocaust is often studied as the most dramatic instance of administrative evil, there are several contemporary examples deserving study. Often atrocities, such as genocide or war crimes, are legal or at least supported by policy decisions. The narrative that a "few bad apples" of poor character instigate bad actions within political organizations flies in the face of both legally sanctioned atrocities (such as the Holocaust) as well as institutional settings and hierarchical authority (as seen in the prison tortures of Abu Ghraib) that social psychologists have shown tend to produce evil acts. According to Adams and Balfour (2004), the emphasis in public administration on technical rationality and proficiency coupled with the value of professionalism, carrying out one's job duties as specified, sets the stage for individual responsibility to be eclipsed. Administrative evil is often justified after the fact by moral inversion or the claim that horrible acts are justified due to a perceived necessity or a claim to a greater good.

### Whistle-Blowing

Whistle-blowing is the practice of public officials disclosing information about wrongdoing in the agencies where they work. Arguably, this is an ethical practice, but not an uncomplicated one. Often, members of the public praise officials who expose corruption and illegal wrongdoing of elected officials or other people in positions of power. Without the whistle-blower, the public would not be aware of the illegal activity. Public interest laws shield whistle-blowers from retaliation by their employers while investigations are ongoing and afterward.

One important question with respect to whistle-blowing is whether or not technically legal, but deeply morally questionable, activities should be subject to whistle-blowing and whistle-blowing protection. One high-profile example of whistle-blowing in recent history is the case of NSA contractor Edward Snowden. He leaked classified documents about how the NSA was conducting surveillance on US citizens to the *Guardian* and is still wanted and in exile. Though Snowden claims to be a whistle-blower deserving of legal protection, he was a contractor rather than a federal employee. The government's position is that Snowden is not a whistle-blower because the actions of the NSA were legal under the Patriot Act and that he leaked classified material that would put US service members at risk. Though Snowden claims to be following his conscience and protecting the principles in the Constitution, his status as a whistle-blower is in dispute.

The ethical issue of whistle-blowing is relevant to the politics-administration dichotomy established by President Woodrow Wilson and legal scholar Frank Goodnow. If Wilson and Goodnow are correct, public administrators should strictly carry out policy without intervention or comment; otherwise, they are engaging in politics. However, if there is no venue for public officials to report wrongdoing without harm to themselves, then public officials engaged in illegal (or perhaps unethical) behavior will be shielded from exposure. The issue of whistle-blowing has not been settled and continues to change as government becomes more complex and the security apparatuses of modern states are more technologically sophisticated.

## The Intersection of Philosophy and Public Affairs

Philosophy, broadly construed, is the search or pursuit of wisdom, though this definition opens the question as to what wisdom is. Philosophy asks the big questions – questions that reach beyond the bounds of empirical science.

The intersection of public administration, public policy, and governance with philosophy most commonly falls along the two branches of the discipline, ethics and political philosophy. In addition to the ethical questions and perspectives above, political philosophy obviously intersects with questions of governance. In public administration, the intersection with questions of political theory is clear. What are the most effective forms of government, economy, and society? What is human nature, and how might human nature affect the structure of the political and public realms? How can we secure justice? What should the government provide for citizens and stakeholders?

However, in order to explore these more practical problems of individual and collective action in ethics and political philosophy, other philosophical questions hang in the background. Metaphysical questions, ones that point to the essence, nature, or proper definitions of things, are involved when one talks about human nature, the distinction between the public and private spheres, and the nature of government and public administration. Epistemological questions also come into play when political theorists ask questions about the truth of policy and administrative efficacy. Ontological questions of how citizen-subjects come into being and change over time and the relationship of humans to nonhuman animals and the environment are also entailed in many discussions regarding democratic practices, social equity, and environmental issues.

One key metaphysical question for public administration is the nature of public administration itself. Is it a science or an art or some combination of both? Herbert Simon (1976) claimed that administration should be guided exclusively by empirical scientific inquiry. Dwight Waldo (1984) claimed that administration should be concerned with social equity and other democratic values and that knowledge of the field should emerge from the reflective practices of both theorists and practitioners. Beginning with Woodrow Wilson, the establishment of the public administration as a technical field that should avoid entanglement with politics, the notion of administration as a technique or science, has been prominent. The aim of administration as a science is limited to efficiency and effectiveness, but perhaps does not interrogate the original aim of policy. Administration as an art prizes individual expertise and experience, as well as the human element in enacting policy.

Another question related to the nature of public administration is what sort of method or epistemic approach is appropriate for the field and whether there is one best method or many to determine the best way to implement policy (see Riccucci 2010). The answer may differ depending on whether or not one considers governing and administration primarily as a science, an art, or a social science. If public administration is a science, quantitative methods are the most legitimate for establishing claims. If an art, then theory and qualitative methods, like narrative analysis, that get at the experience of public servants and stakeholders are the path to the truth. If a social science, a combination of those methods is likely the most appropriate.

Debates and discussions on these philosophical questions are featured primarily in three academic journals: *Administrative Theory & Praxis* (*ATP*), *Journal of Public Administration Research and Theory* (*JPART*), and *Public Administration Review* (*PAR*). People interested in the intersection of philosophy and public administration, governance, and policy will find perspectives on these debates and work influenced by the schools of philosophical thought below.

## Influential Schools of Thought

### Positivism/Scientism

Positivism is primarily an early twentieth-century philosophical movement that advocates that all knowledge comes through the application of scientific method. Prominent figures of philosophical positivism include A. J. Ayer, Rudolf Carnap, and W. V. O. Quine, among others. As an epistemology (theory of knowledge), positivism claims that all knowledge comes from logic or the empiricism of the scientific method. All other kinds of human endeavor are effectively excluded from the field of knowledge, including metaphysics which deals with concepts beyond the scope of scientific inquiry, like the existence of God or the nature of reality. The aim of positivism was to stop philosophy's constant churning on unanswerable questions that had characterized Western philosophy and to recreate philosophical inquiry as a science.

The effects of positivism (or scientism) have influenced the fields of public policy and administration by applying scientific method to the practices of governing. Embodied most clearly in the works of Simon, the aim of administration is efficiency, and the scientific study of how government organizations should be arranged, how human beings should operate in government, and how to create workable policies should serve this end (Simon 1976). In so far as human beings are necessary to form organizations, the study of human psychology as a science should come into play in positivist administrative theory. The object of scientism is not necessarily to purge politics from administration but to ensure that the practice of administration is informed by sound empirical research.

### Pragmatism

Pragmatism is a uniquely American philosophy that claims that what is true is what works, what is useful, and what can further human flourishing. According to pragmatism, a theory should be a tool that assists us in solving real world problems, and the value of any philosophical claim lies in what it does, not what it states. The ethics and politics of this basic epistemology fit with the goal of human flourishing and progress; theories and truth claims are only true in so far as they further the ends of humans, both individually and collectively. The key theorists in this school of thought are Charles S. Peirce, William James, John Dewey, as well as the political figure Jane Addams. Particularly in the political thought of Dewey and Addams, pragmatism saw participatory democracy and what they called "a community of inquiry" as key to finding solutions to political problems where stakeholders would participate.

Pragmatism is a natural fit for policy making and public administration because it is applied, practical, and fits with democratic aims. Governance theorists have used it as a model to break free from traditional practices, to try new modes of governing that are more participatory, and to assess public programs. Particularly Dewey's notions of what constitutes a genuine democracy in terms of education, participation, and furthering the ends of humanity into the future have been particularly influential in public administration theory and policy making. Some criticize pragmatism's influence on policy and governance because it has furthered a scientific approach to administration and demands a particular accounting of outcomes that may exclude other important principles besides what works.

### Postmodernism/Poststructuralism/Anti-foundationalism

The interrelated sets of philosophies developed in the late twentieth century of postmodernism, poststructuralism, and anti-foundationalism have been influential in political and public administration

theory and have certain claims in common. First, reality is not identical to how we experience it, and one foundational set of truths about reality may not exist or at least may not be available to human observers. Second, the subject or human self is not a unified whole, and our selves are not transparently known to us. Third, meaning, including the meaning of common political ideas, is always a contested and contestable ground, and these meanings change over time. There is no foundational truth about reality, ourselves, or the meanings of things available to us as we develop policy and make collective decisions together (Farmer 2010, pp. 89–114).

These claims may seem unsettling to some; however, they also can expose the ways in which we presume foundations that are not really there. If we use such questionable and contested foundations to develop knowledge and practices for policy and government, we limit our options to only those that rest on this uncertain foundation. For example, in democratic governance, public officials often see "the people" or "the will of the people" as the ultimate justification for what they do. However, a poststructural analysis of the concept of "the people" may expose that who or what constitutes the people is unclear and changes depending on application (Catlaw 2007). When we ask ourselves the question of how to define "the people," the answer may not be clear. Opening up the dialogue beyond such presumed foundations can also allow theorists to propose radically new visions for the potential policy and implementation that can create more profound social change.

### Critical Theory

Critical theory is a perspective that stems from the work of the Frankfurt School philosophers and sociologists, such as Max Horkheimer, Theodor Adorno, Herbert Marcuse, and Jürgen Habermas, among others. These theorists created a post-Marxist set analyses to challenge the inequities of power and wealth in liberal democracies. The aim of critical theory is to conceptually dismantle the dominant ideology which frames certain realities as normal and to create alternative views of society and the economy which would be more socially just.

The use of these theories by public administrationists challenges the notion of a neutral civil service and the notion that politics can be driven out of matters of governance (Box 2005). Not only can politics or a particular perspective be driven out of the creation and administration of policy but public officials can and should develop a critical consciousness and serve the function of providing stakeholders with critical perspectives and become agents of change themselves. Without this intervention on behalf of officials, the unquestioned dominant ideology continues to hold sway unchallenged and social change is stunted.

### Feminism

Feminist theory is itself an interdisciplinary pursuit, heavily influenced by philosophy. Feminist philosophy has explored the nature of the subject as gendered, how gender operates in the formation of the self and structuring our thinking and behavior, as well as addressing social, political, and economic inequalities faced by women and strategies for how to overcome them. Feminism touches on all branches of philosophy: ethics, political philosophy, ontology, metaphysics, and epistemology. Feminist theory has been influential in the women's liberation movement of the 1970s and in public debates on women's issues, such as reproductive rights, equal pay for equal work, women in the military, and others.

As applied to matters of governance, feminism explores the exclusion of women from governance through formal and informal means. Feminist theories explore not simply the notion of equality between the sexes as an aim but the nature of power and its redistribution in society more broadly. Feminist theorists have explored how to make democracies inclusive by critiquing how people are excluded from decision-making on the basis of gender and sexuality, how claims of being gender-neutral mask these exclusionary practices, and how by looking through the lens of gender, new ideas, forms of organization, and schemes for participation and deliberation can be developed that are more genuinely inclusive of women and sexual and racial minorities. A key contribution in feminist theory and public

administration comes from Camila Stivers in *Bureau Men, Settlement Women: Constructing Public Administration in the Progressive Era* (2000), which explores the gendered nature of administrative work, the different roles of men and women have played in public service, and how our narratives about gender have constructed our views of public service.

### Phenomenology

Phenomenology is a method developed by German philosophers Franz Brentano, Edmund Husserl, and George Dilthey that seeks to isolate the structure of human experience so that it can be examined objectively by the experiencer. The aim of phenomenology is to get to the truth about human existence through these structures of the permanent features of human experience, such as language, intersubjectivity, and death. Such analysis can get us to the truth of human experience and provide insights about our "life-world" (the world as we experience it) that is different from the way we experience it in the unreflective "natural attitude" (our usual way of living in the world without examining it). Phenomenology deeply influenced French existentialism and existentialist ethics (discussed above).

Through this sort of qualitative research of description of experience, it could be possible to see more clearly the structure of organizations as the human experience within those organizations is interrogated. It provides an opportunity for reflection on and comparisons of the experience of people in public organizations to get beyond the formal structure (like the organizational chart) to the organization as it is experienced (Jun 1994). Phenomenology draws from the experience of public officials and citizens engaged in public work as a resource for developing insights.

## Conclusion

The focus of both ethics and philosophy is asking questions and exploring different perspectives on reality and human action. Perhaps, if governance and public administration is simply a matter of applying technically sound procedures, then ethics and philosophy may not have much to contribute to these interdisciplinary fields.

However, if human decision-making, perspective, values, and even biases come into play in governance, then developing an ethical and philosophical consciousness around the development of policy and practices of public administration is critical. Self-reflective practitioners may be more aware of the implications of their work, possible biases embedded within their agencies, and undemocratic practices that fuel inequities and undermine the communities that they serve. Awareness of ethical and philosophical questions in the art of government may allow public servants to be more responsive to their constituents, to reduce inequities where they exist, and to protect sound, democratic practices.

# Ethics and Policing

Kim M. Loyens
Utrecht School of Governance, Utrecht University, Utrecht, The Netherlands
Leuven Institute of Criminology, Leuven University, Leuven, Belgium

## Introduction

Police have the authority to legitimately use physical force. It is therefore essential that legal rules and procedures are installed that regulate police practice. However, such formal instruments cannot avoid police officers behaving unethically. Rule bending and excessive use of force have predominantly been explained by referring to a specific culture in police agencies. A central question in police culture literature is why police officers bend or break legal rules and keep quiet when colleagues commit integrity violations. High levels of internal loyalty and cynicism to society are said to be important factors that explain such unethical behavior. This focus on rule-breaking and cover-up practices in the classic police culture literature has led to a rather negative approach in police ethics research that resulted in an extended body of literature on the prevalence of police corruption and how to avoid it. Alongside the implementation of new policing models, police researchers shifted attention to gaining understanding of what good policing is and which ethical dilemmas police officers are faced with in practice. Inspired by the compliance- versus values-based approach in ethics management, the conclusion is drawn that police research has too long been out of balance as a result of excessive attention to either the compliance- or the values-based side of the continuum. An integrated research approach that combines both is necessary to avoid undesired side effects of a one-sided approach.

## Police Culture Leading to Noble Cause Corruption, Rule Bending, and Cover-Up

Cultural aspects in policing have been studied extensively since the important anthropological work in the 1960s and 1970s. These studies often explicitly relate police culture to police ethics. In general, the police culture literature describes typical job characteristics in police organizations, explains how these characteristics lead to a typical police culture, and then elaborates on ethical risks thereof. The classic police culture model has received much justified criticism, and serious efforts have been made to address the critiques. Nevertheless, no appropriate alternative framework has been developed in this tradition to study cultural aspects within the police. The classic model is therefore still an important source of inspiration to study ethics within police organization. This part will give a brief overview of the most important insights of the police culture literature, and how these have been criticized.

Important characteristics of the police job are, among others, a high degree of discretion, the frequent encounter with lawbreakers, and the constant threat. Each of these characteristics can increase the risk of integrity violations. First, police officers are typical street-level bureaucrats (Lipsky 1980) who have the autonomy to make personal judgments on how to deal with the citizens they interact with. They also have the

freedom (albeit not always supported by legislation) to decide how they apply the legal rules and procedures they are subjected to in their daily practice. Such autonomy implies the risk that police officers break rules or abuse their authority without their supervisor being able to detect such integrity violation. This risk increases dramatically if in the organizations rumors exist of high-ranking officers being engaged in "ethical lapses, double standards, abuses of office and unprofessional conduct while preaching ethics and integrity to front-line personnel" (van Buuren and den Boer 2009, p. 8). Second, working in an environment where you are constantly confronted with the "dark side" of society might cultivate a cynical attitude. The frequent encounter with lawbreakers is said to result in "moral cynicism" referring to a view of the world as a jungle where crime, corruption, and brutality are considered normal aspects of the everyday reality (see, e.g., Westley 1970). Goldstein describes it as follows:

> The average officer — especially in large cities — sees the worst side of humanity. He is exposed to a steady diet of wrongdoing. He becomes intimately familiar with the ways people prey on one another. In the course of this intensive exposure he discovers that dishonesty and corruption are not restricted to those the community sees as criminal. He sees many individuals of good reputation engaging in practices equally dishonest and corrupt [. . .]. It is not unusual for him to develop a cynical attitude in which he views corruption as a game in which every person is out to get his share. (Goldstein 1975, p. 25)

This attitude might encourage "noble cause corruption," which is a type of rule bending aimed at stopping lawbreaking. In other words, police officers then use illegal means to obtain legal goals. This is, according to the traditional police culture model, considered acceptable by fellow police officers, because they label themselves as the "good guys" fighting the "bad guys" with any means necessary (Loyens and Maesschalck 2014). A classic example is threatening or misleading a suspect to induce a confession so he will be convicted. The third risk of unethical behavior is the constant threat of danger. Although police work is often dull and unexciting (e.g., waiting in patrol cars until something happens and doing administrative work), it can sometimes be extremely dangerous. Reiner (1992: 110) states:

> The police officer faces, behind every corner he turns or door-bell he rings, some danger, if not of firearms at least of fists.

Therefore, police officers are said to have developed a general attitude of constant distrust toward society that isolates them from citizens, but simultaneously increases the need of being able to trust upon colleagues. In other words, in the face of danger, counting on fellow officers is essential. Police researchers have indeed found a deep-rooted solidarity in police organizations in which rules of thumb like "don't give up another cop" (Reuss-Ianni 1983) and "cover yourself and don't rat on others" (Chan 1996) are vital. Solidarity implies that "snitching" is considered an act of betrayal. Hence, it has been argued that police officers tend to cover up each other's mistakes, which is conceptualized as the "blue code/wall/veil of silence" (Chan 1996).

In addition to these three central characteristics of police work, other aspects of police culture have been linked to unethical behavior in police agencies. Research has uncovered patterns of gender and racial discrimination, both within police organizations as in police-citizen interaction (Chan 1996; Reiner 1992). Although recently there is still evidence of both types of discrimination, as shown, for example, in the public indignation about racial profiling incidents, a number of successful policy initiatives aimed at decreasing discrimination on the basis of gender or race cast doubt on the validity of the traditional police culture literature nowadays. Obviously, these developments have not completely exterminated sexism and racism within the police or by the police, but they do give ground to doubt the validity of the police culture model in the twenty-first century. This shift has been partly confirmed in empirical research (Loftus 2009; McLaughlin 2007). The core criticism that has been raised against this model is thus its false assumption of police culture being monolithic, cohesive,

homogeneous, and unchanging (Paoline 2003). Furthermore, the classic conception of police culture does not even allow looking for variation in how police officers experience their work in different teams and regions or over time, although variation (albeit sometimes subtle) has been found in non-Anglo-Saxon studies (for a brief overview, see Loyens and Maesschalck 2014). During the past few decades, some interesting alternatives to the classic model have been suggested, such as the "two cultures" approach distinguishing "management cops culture" and "street cops culture" (Reuss-Ianni 1983), the identification of "police operational styles" (e.g., Wilson 1968), the "tool kit" approach of police culture (Herbert 1998), and Chan's (1996) application of Bourdieu's model of the interplay between field and habitus, referring to structural dispositions and cultural dispositions, to policing. These alternatives have, however, not been broadly adopted by scholars studying culture or ethics within the police. Hence, the classic model of police culture has for a long time been a dominant perspective to understand police culture, as well as police misconduct. This has not only hampered empirical and theoretical development within the research domain, it has also shown police work in a bad light. The link between police work and risks for unethical behavior in the police culture literature might indeed give the impression that such behavior is widespread within police agencies, while no reliable data of its prevalence are available.

In the same line and even more problematic is the limited attention to positive elements of police culture. Despite a few attempts to emphasize the value of socialization in police agencies to learn the "craft" of policing (Van Maanen 1974) and the explicit acknowledgment that presumably negative aspects of police culture can be highly functional (e.g., cynicism as the "Janus face of commitment," Reiner 2000, p. 90), emphasis in police studies has long been on the violation of rules or procedures and the cover-up of ethics violations. This one-sided negative view of police culture asks for a shift to a more positive approach which is built around the question of what good police work is.

## Compliance- or Values-Based Police Research

The risks of one-sided police ethics research can be mitigated by framing such research within the compliance- versus values-based approach of ethics management (Paine 1994; Maesschalck and Bertok 2008). This framework, which is in fact a continuum, has been used as a normative model to develop ethics management policies, but can also broaden the scope of police ethics research. The compliance-based approach in ethics management is based on the underlying assumption that people will break the rules if they are given the opportunity to do so. Applied to policing, this pessimistic view of humanity implies that police officers will take the opportunity to abuse the autonomy they have been granted by disregarding or breaking rules and procedures in occasions where the risk of detection is low. Policy instruments that are suggested in this tradition to avoid rule-breaking aim at enforcing strict compliance of prevailing standards and rules or measures to reduce opportunities to break such rules. This is done by means of legal rules, clear procedures, and control mechanisms (OECD 2000). The values-based approach is, on the other hand, based on an optimistic view of humanity in which police officers are willing to do good and to behave in an ethical way, but do not always know what is ethical in a specific situation and how to apply rules in an acceptable way. For this, police officers need support or advice from the organization, their supervisor, or their colleagues. Policy instruments in this tradition are built around central values that are shared within the organization and support mechanisms, such as the installation of an ethics committee or a network of confidential advisors and training sessions in which police officers can discuss ethical dilemmas they encounter with colleagues. Hence, police officers' discretion should not simply be reduced or regulated as suggested in the compliance-based approach. Rather, police officers should be given tools that help them deal with their discretion in an acceptable way (Maesschalck 2012). The main argument underlying this continuum is that ethics management can only be successful when

combining a compliance- and a values-based approach.

The same principle can be applied to police ethics research. Research that fits the compliance-based approach focuses on the prevalence of integrity violations in police agencies (Huberts et al. 2007). Research that fits the values-based approach aims to understand what good police work is and how ethical issues are experienced in practice. Most scholarly work on police ethics has focused on the compliance side of the continuum. Studies using the Police Integrity Survey, developed by Klockars et al. (2000) are well-known examples of such type of research. This survey instrument uses vignettes to study the perceived seriousness of different types of integrity violations in 11 (later extended to 17) hypothetical situations and police officers' willingness to report them if these violations are observed (Klockars et al. 2006). The Police Integrity Survey has been replicated in many studies in different countries (Huberts et al. 2003; Rothwell and Baldwin 2007; Lim and Sloan 2016). In the same tradition, Huberts (1998) developed a survey instrument to measure the frequency and acceptability of nine types of integrity violations in police agencies, such as illegal use of organizational power for personal gain, police fraud and theft, dubious promises and gifts, questionable sideline activities and jobs ("moonlighting"), etc. The respondents were particularly asked how often they had observed these violations and how acceptable they consider them (Lasthuizen et al. 2011). This instrument was further developed and extended to be applicable in all public sector organizations (Lasthuizen 2008) and later validated by using empirical data of about 64 manifestations of integrity violations among Dutch police officers (Lasthuizen et al. 2011).

On the other side of the continuum, scholars can be found who emphasize the importance of values-based policing. This line of research has been developed alongside the introduction of new policing models, such as community-oriented policing and reassurance policing (Innes 2004). While these models were aimed at altering the way in which police officers approach citizens and (re-)establish public trust (Reiner 2000; Chan 1996), they have also at least partly led to a mind shift among police researchers. Instead of emphasizing the negative side of policing and risks of integrity violations, researchers were encouraged to focus on the value of policing for society. While previous scholarly work seems to have narrowed police ethics research to analyzing what goes wrong in police agencies, the values-based approach in police research studies what is good and legitimate policing (Bradford et al. 2013), but simultaneously acknowledges that police work involves constantly making tough decisions in situations with conflicting values and interests. The latter has, for example, inspired research on ethical decision-making by police officers (Loyens 2012), storytelling in the police canteen (Waddington 1999; Van Hulst 2013), and sensemaking in police work (Landman 2015). Based on qualitative, often ethnographic, research, these studies focus on how police officers experience their work, which dilemmas (often including moral issues) they face in their everyday work, and how they give meaning to their daily practices.

Although the values-based approach in police research provides a useful alternative for the one-sided compliance-oriented studies, it also entails an important risk. The pursuit of intrinsically good values, such as public trust, might also encourage undesirable behavior like favoritism. Moreover, the optimistic view of humanity can be considered naïve. A combination of the values- and compliance-based approach is thus needed to enable studying complex, interacting processes within police organizations that might lead to both misconduct and desirable behavior or result in tough ethical dilemmas. Some scholars have already applied the compliance- and values-based approach to police ethics (Huberts et al. 2007; Maesschalck 2012), but more empirical research is needed to further develop this integrated perspective in police research.

## Conclusion

Research on police ethics has its roots in ethnographic studies on police culture. While this

tradition has led to important insights, it has been criticized for considering police culture as universal and homogenous and for using a one-sided negative approach. This has inspired scholars to study police work from a compliance-oriented perspective, focusing on the frequency and acceptability of integrity violations and the willingness to report them. Recently, attention has shifted to values-based research aimed at studying good policing and everyday dilemmas in police work. Both approaches have resulted in useful insights, but provide an incomplete picture. Furthermore, if used in isolation, the risk exists that the complexities of police ethics are overlooked, which in turn might result in the formulation of oversimplified conclusions and solutions. These approaches should thus be considered complementary and combined in police ethics research. Despite a few valuable attempts to analyze police behavior by means of the compliance- and values-based continuum, more empirical research is needed to further unravel the complexities of police ethics.

### Synonyms

Administrative ethics; Moral philosophy; Public ethics

### Introduction and General Overview

This article addresses ethics in a democratic republic. It does not attempt a consideration of this topic in nondemocratic regimes, nor does it explore the topic of public ethics, except incidentally, outside of the United States, though comparative political ethics is a productive and important field. This essay also addresses the ethics of nonelected pubic officials, not elected officials, although, once again, the concerns are not entirely separable. Scholarship and issues surrounding the ethics of elected officials would require a separate essay.

The term "ethics" and the phrase "moral philosophy" are, for the most part, used interchangeably, although "moral philosophy" is the more traditional phrase and "ethics" seems to be the term of choice in contemporary discourse. "Moral philosophy" as a college/university course was taught as the inception of the American college, sometimes by the institution's president himself, indicating its importance (Adamson 1922; Adams 1850; Conant 1962; Honeywell 1931; Marion 1986; Walton and Preinkart 1932; Miller 1984).

A consideration of public ethics should also begin with a consideration of the rich Western tradition of moral philosophy. Although a precise list of the classic texts on moral philosophy is difficult, such a survey must include among others *The Republic* (Plato 1991); *The Laws* (Plato 1988); *The Apology* (Plato 1981); *The Euthyphro* (Plato 1981); *Nicomachean Ethics* (1984a); *The Politics* (Aristotle 1984b); "Treatise on Happiness" (Aquinas 1984); "Treatise on Law" (Aquinas 2000); *The Prince* (Machiavelli 1998); *Leviathan* (Hobbes 1967); "The Second Treatise of Government" (Locke 1960); *Critique of Practical Reason* (Kant 2002); "On Liberty," "Utilitarianism," and "On The Subjection of Women" John Stuart Mill (2002); *Beyond Good and Evil* (Nietzsche 1977); *Thus Spoke Zarathustra* (Nietzsche 1977); *Beyond Good and Evil* (Nietzsche 1977); and *Fear and Trembling* (Kierkegaard 1986). Principle academic journals concerned at least in part with ethics in the public realm include, though are not limited to, the *Public Integrity*, *American Public Administration Review*, *Journal of Public Affairs Education*, *Philosophy and Public Affairs*, *Political Science Quarterly*, *The American Political Science Review*, *Perspectives on Politics*, *PS: Political Science and Politics*, *Public Personnel Management*, *American Review of Public Administration*, and *Administration and Society*.

A useful distinction, though not widely used, is between "macro" ethics and "micro" ethics, the former referring to broad questions of the moral dimensions of public policy and the latter to the ethical behavior of individuals in public offices, even if these two are not always separable. The two terms are not always separable, practically or theoretically, since the integrity of those directing the elements of a certain policy are not insulated from the moral questions arising from the policy they are promoting and/or implementing (Jurkiewicz 2012). These distinctions sometimes lead to questions of public and private morality;

that is, whether the two spheres may or should be kept separate, a possibility which is generally rejected by scholars (Thompson 1985; Hampshire 1978; Dobel 1999; Edmondson 2001; Malatesta and Carboni 2015).

Most agree that public administration as an American profession originated in the early twentieth century, during the Progressive Era, with urban reformers advocating the application of scientific and business practices to rehabilitate corrupt city governments (Bowman 1980). That approach transformed governance in the United States but also guaranteed recurrent debate over the proper role of public administrators, who must balance the often contradictory demands of efficiency and their constitutional obligations. Cooper has argued that administrative ethics as a significant field of study is only about 30 years old, dating from the mid-1970s, and largely instigated by the work of the "New Public Administration." This position, however, seems to discount the broad and rich academic heritage of public administration, and to overweight the importance of the New Public Administration contributions.

## Friedrich-Finer Debate

A productive and long-standing debate is between the comparative efficacy of "internal" controls and "externals" controls guiding managerial behavior. This distinction received attention in the iconic Friedrich-Finer debate in the early 1940s which concerned the most effective way to ensure accountability of public officials in a democratic system. This debate asked whether professional external controls or whether an individual informed and cultivated conscience is the better guarantee for ethical public managers.

Friedrich (1940) asserts that public officials can deal with administrative problems most ethically through internal checks. These checks are cultivated by various means including internalized professional standards and technical knowledge. Friedrich's view suggests that the complexity of public administration requires professionals to deal with ethical decisions because they are the only ones who have the knowledge to enclose the proper understanding of how to deal with ethical issues – no one else can properly do so. Thus, professionalism is the appropriate framework to guide administrative ethics because its combination of high standard technical knowledge and subjective ethical standards ensures the highest standard of ethic behavior and provides the best assurance of accountability.

Finer (1941), though, argues that external control by elected legislators is the proper way to enforce the ethical excellence of officials in public affairs. Finer deems public professionals insufficiently trustworthy to privately – or at least subjectively – determine the appropriate action that ensures the public good, arguing that public servants are to be closely responsive and directly responsible to the public's elected representatives, and by extension, the public. Finer insists that a reliance on internal checks and controls, such as Friedrich describes, leaves public officials more susceptible to corruption of one kind or the other in public management.

## Rationalism and the Science of Administration

Early in the modern history of public ethics, Woodrow Wilson argued that politics and administration should be separate in concept and practice; indeed, arguments for a scientific administrative profession discouraged any consideration of ethics for several decades (Wilson 1887, 2011). Early writers in the field of public administration "emphasized the power of reason to order human affairs" to the exclusion of less rational views of public management. (Spicer 1995) notes that the early influential scholars in the field, for example, Max Weber and Frederick Taylor, promoted a rational view of administration, in which subjectivity and values, as well as politics, need not enter into the administrative and management process.

Simon's (1946) seminal article, "The Proverbs of Administration," reinforced the scientific, rational view of administration by arguing that most of the values and ethical principles

that were being promoted as guidance for public managers were little more than platitudes or proverbs. Accordingly, he urged a rational and scientific paradigm for the pubic service, one that is divorced from politics and normative concerns.

Drawing on both his academic career and bureaucratic experience, Dwight Waldo (1980) challenged the logical positivist idea that facts and values can be clearly and cleanly distinguished. Because much of the scientific study of politics and political institutions was then being built on a logical positivist assumption, this was a considerable challenge to what was, at that time, becoming the dominant perspective in political science. Accordingly, in 1952, Waldo and Herbert A. Simon, author of the highly influential 1947 book *Administrative Behavior*, famously clashed over scientific administration's insistence on separating values from facts (Simon 1997). The exchange was highlighted in the *American Political Science Review* in 1952. The two did agree on the problem of naïve and facile confidence in scientism, but their more fundamental disagreements have proven to be useful in identifying many of the basic debates in public administration in general and public ethics in particular: these include the extent to which values may be excluded from public management, the degree to which the Constitution restricts administrative behavior, and the meaning of "responsible" administration (Harmon 1989).

Waldo's view, exercised in part by his book *The Administrative State*, first published in 1948, has predominated over time. He consistently holds with the basic assertion that the scientific method fails to reconcile administration with democratic values. Orthodox thought held that public managers should strive for a European ideal of detached, "scientific" administration, in which policies are to be implemented, individual reflection being unnecessary and inappropriate. Waldo argues that public servants should become active, informed, politically alert agents of change, whose mission is to improve the human condition and strengthen democracy. Among other things, Waldo's work provides an ongoing caution about disconnecting public administration from political science. At the same time, he anticipates the debate over just how active an agent of change public managers may be given the US Constitution (Waldo 1980).

## Watergate and Corruption

Werner (1983) reiterates that prior to the Watergate episode, the study of ethics was neglected, in part because of the "scientific origin of public administration" and also because of Wilson's influential insistence on the separation of administration and politics. The Watergate scandal (1972–1974), however, culminating in the resignation of President Richard Nixon, was the watershed event that forced a significant change in thinking about public ethics, even if such a shift would have inevitably occurred anyway over time. Sundquist (1974) argues that the impact of the Watergate scandal was made decidedly worse because it followed on the heels of the Vietnam War, another "breakdown," even though assessments of the nature and causes of that breakdown will differ. Accordingly, a "crisis of confidence in the entire system" emerged. He further argues that these episodes exposed a failure of both political and administrative checks and balances. In the wake of Watergate, several important legislative initiatives transpired, for example, The Ethics in Government Act of 1978 and the Inspector General Act of 1978 (Dempsey 1985).

In recent decades and especially with the catalyst of the Watergate scandal, courses in professional ethics are a staple of most curricula, whether the profession be medicine, architecture, or public service, for example, most MPA programs now require a course in Administrative (or Public) Ethics. Since then, scholarly work on administrative ethics and its application to practice have expanded with considerable speed and diversity. The number of journal articles, books, courses, conferences, and training exercises has proliferated, and public ethics has demonstrated its sustainability and its centrality to the field. Zimmerman (1982) suggests that corruption has four main components: "opportunity, incentive,

risk, and personal honestly." The first three are "controllable" by public authority; the last is not, hence, the need for scholarly interest.

Consideration of administrative corruption took a new turn with Adams and Balfour (2009) who argue that the prevailing cultural context, with its emphasis on technical rationality, has fostered a new and dangerous form of "evil." Adams and Balfour discuss the overlooked relationship between evil and public administration, as well as other fields and professions in public life. The authors argue that the tendency toward administrative evil, as manifested in acts of dehumanization and genocide, is deeply woven into the identity of public administration, as well as other fields and professions in public life. The common characteristic of administrative evil is that ordinary people within their normal professional and administrative roles may engage in acts of evil without being aware that they are or they are indifferent to the wrong that they do. The subjectivism element in such an approach reveals itself in choosing just what is evil and what is not. Some offenses are undoubtedly self-evident, but other possible malfeasances may not be. Jurkiewicz (2012) further develops this topic by expanding on the concept of organizational evil as she distinguishes between the "microlevel" of administrative evil – that is committed by discrete individuals – and the "macrolevel" of evil that occurs on the policy and cultural levels of the organization.

Giacalone and Jurkiewicz (2003) provide a welcome perspective on ethics by taking a network sample of employees from across the United States to assess the relationship between individual spirituality and perceptions of unethical business activities. Analyses indicate that degree of individual spirituality influences whether an individual perceives a questionable business practice as ethical or unethical; that is, religion may heighten ethical awareness. Such a finding should not be surprising given the century-old normative dimension of spirituality. Ramifications of these findings regarding the role of spirituality in enhancing workplace ethicality, as well as directions for future research, are included in their conclusions.

## Democracy, Citizenship, and Regime Values

Mosher (1968) was an early voice in noting the inevitable tension between professionalization in public service and accountability in a democracy; accordingly, he expressed concern over a "marginalization of the public interest." John Rohr (1986, 2002) has been the leading voice advocating that public servants accept the Constitution as their key ethical guide. Rosenbloom (1992) has similarly argued that the Constitution is the ethical map for public managers.

According to Rohr and others, although Wilson and his fellow civil service reformers exerted considerable influence on the development of the American administrative institutions, they were inadequately appreciative of the constitutional framework in which they operated. As a result, we find ourselves living today in artificially isolated administrative state seemingly bereft of legitimating principles grounded in the political thought of the framers of the Constitution. Rohr and others are concerned to justify the administrative state within the American constitutional tradition, a concern perhaps inadequately appreciated in the Progressive Era, in, for example, the writing of Woodrow Wilson and Frank Goodnow (Pestritto and Atto 2008).

In establishing "regime values" to guide administrators, Rohr draws on three significant founding sources from which to draw legitimacy: (1) the founding of the republic, 1787–1795; (2) the founding of public administration, 1883–1899; and (3) the founding of the administrative state, 1933–1941. Additionally, he looks to the US Supreme Court jurisprudence as a legitimizing source. Thus, public administration finds its ultimate authority in the US Constitution which provides structural safeguards to protect the integrity of administrative decision-making while also holding it accountable (see also Spicer 1995).

Brown (1983) argues that the leader should see a professional obligation for ethical behavior not only to himself but also to the organization as a whole. The consideration of the two spheres of behavior is inseparable (Brown 1983). (Frederickson and Hart 1985) call for a

"patriotism of benevolence," a concept which they suggest has its roots in the Scottish Enlightenment and is reinforced by Alexis de Tocqueville's thought (Tocqueville 2003). Gawthrop believes that, given the growing complexity of governance and the intensifying nature of the administrator's role, a renewed meaning of civic character is necessary (Bruce 2008; Gawthrop 1984). Cooper (1991) and Chandler (1984), among others, argue that the touchstone of public ethics should be the concept of the public manager's dual identity as manager and a citizen, so that the public manager most closely identifies with those he or she serves. At least theoretically, this would help close the gap between the citizen and the administrative apparatus that serves the citizenry (Frederickson 1982; Frederickson and Chandler 1984).

Likewise, Ventriss (2012) notes that a focus on managerial approaches, technical competency, and adherence to procedural rules is unlikely to provide the normative framework necessary to connect citizens with their government. For that reason, he follows Frederickson in calling for a renewed emphasis on bureaucratic citizenship to reconnect the citizenry to its government so as to better understand and manage the normative interrelationships between political and economic issues. In doing so, public administration might better assume a leading role in public life, and the normative dominance of capitalism and individualism might be tempered.

## Professionalism and Codes of Ethics

An important consideration is that ethics should primarily be guided by some conception of professionalism (Jones 1982; Kearney and Sinha 1988). In this argument, one may find echoes of the classic Friedrich-Finer debate; according to Kyarimpa and Garcia-Zamor (2006), those who rely on a conception of professionalism to determine the framework of administrative ethics may rest this expectation on the premise that formal fixed codes that are built on technical knowledge will guide the public manager. Thus, to ensure the efficacy and ethics of public administration, officials should follow goals, mission statements, rules, and regulations. There does, however, arise a question of whether professionalism constitutes external restraints and guidance or whether it is something internalized and individualistic.

Bowman (1981) and Zimmerman (1982) provide extensive surveys of Codes of Ethics. The road to construct a Code of Ethics for the American Society for Public Administration (ASPA) has been a long and at times difficult one, with several twists and turns. In an early essay, Moneypenny (1953) discussed the limited effectiveness of a Code of Ethics that it might consist of little more than superficial piety if such principles are not internalized by the individual. He concluded, however, that on balance, such a code is useful, especially if it is tailored to the particular professional context in which it is to be applied. Other questions had to do with, among other things, whether a Code of Ethics was even appropriate. Chandler weighs the arguments for and against a code and concludes in the affirmative (Chandler 1982, 1983).

ASPA adopted a loose set of ethical principles in 1981, and, in 1984, ASPA approved a formal Code of Ethics which was expanded the next year to include implementation guidelines.

In 1993, ASPA's leadership further revised the ASPA Code of Ethics (Van Wart 1996). More generally, Mentzel calls for more and better research on the role that Codes of Ethics play in encouraging ethical behavior (2015).

## Whistle-Blowing and Statutory Approaches to Ethics Enforcement

Bowman (1980) supplies a comprehensive overview of the phenomenon and importance of whistle-blowing noting that such activity involves two important values – on the one hand, the necessity of accountability to the public for institutional behavior and, on the other hand, due process protections for those willing to expose governmental wrongdoing. He explains, however, that greater attention is needed regarding the protection of the whistle-blower. Whistle-blowing has received increasing support over the years,

even to the extent that cash awards may be provided to whistle-blowers; such statutes, however, can only offer so much protection, especially in the months and even years after a whistle-blowing incident.

In a related consideration and employing case studies, offers a fresh perspective by arguing the importance of workplace dissent and presents strategies for ways public servants can ethically engage in "guerilla activity" in the interest of making the workplace more accountable and the ways managers can tap into the potentially insightful and creative ideas of dissenters. To the extent, there is an agreement that campaign finance morally compromises those in the public service; most major legislative efforts to regulate campaign finance have often foundered on interpretations of the First Amendment. Mentzel (2015) notes that statutory approaches to ethics often do little more than discourage unethical behavior rather than encourage ethical behavior. Kyarimpa and Garcia-Zamor (2006) state that although rules and regulations are instrumental in the education and training of public servants, they often fall short of guiding those same individuals when they are faced with personal conflicts of interests and other difficult discretionary challenges.

## Virtue-Based Ethics

MacIntyre (1981) sounded an early – and now classic – warning that the traditional concept of virtue was in danger of extinction. In administrative ethics, Lilla (1981), in a forceful criticism of a rational analysis approach to ethical decision-making, advocated the cultivation of a character profile suitable for those in the public service, and Sommers argues that ethics without formation in virtue might be as detrimental as beneficial since it may only teach moral cleverness (Vetterli and Bryner 1987). For those reasons and more, virtue-based ethics are now given considerable attention, although scholars may vary in the extent to which they draw upon classical conceptions of virtue or if they are more innovative in their construction of the profile of the virtuous administrator. Dobel (1999, 2001, 2010), for example, emphasizes the Aristotelian virtue of "prudence," while Bailey (1964) argues, with echoes of the Aristotelian division of moral and intellectual virtue, that the source of ethics for the public servant is an innovative combination of individual moral qualities and mental attitudes. The former are "courage, optimism, and fairness"; the latter are "a recognition of the moral ambiguity of all persons, the importance of context in determining moral priorities, and an understanding of the paradox of procedures." Bailey's construct might be understood as an update on the Aristotelian-Thomistic arrangement of intellectual virtue and moral virtue, although it is not clear if that is his intention (also see Lilla 1981).

Chapman (1993) asserts that the personal values of public officials are the most important element in administrative ethics. He criticizes the reliance on professional code of ethics alone because they may not help public administrators to deal meaningfully with "real" situations. Hart (1984) suggests that the necessary traits of character for public servants are "superior prudence, moral heroism, caring or love for humanity, trust in the citizenry, and a continuing quest for moral improvement." Cooper and Wright (1992) argue that to the extent that character is important, it can often be best taught or encouraged by studying the lives of public leaders known for their strength of character. Pincoffs (1986) has concluded that a virtue-based ethics means that public administrators should be in the business of "judging" the character of their colleagues and prospective characters. On the one hand, being a "good judge of character" may be little more than common sense; on the other hand, Pincoffs seems to elevate the act of judging character to a kind of skill or even a virtue.

## Social Equity and Sexual Harassment

The "New Public Administration" followed the "Minnowbrook" conference at Syracuse University in 1968. It was organized by Dwight Waldo, prompted by complaints that public administration as a discipline had become irrelevant (Marini

1971). The ideas of the New Public Administration have drawn considerable attention, which may have had as much to do with a dearth of new ideas in public administration as with the substance of New Public Administration itself, which is largely aspirational and politically (well) left of center – a product of the 1960s. These endeavors have drawn not only attention but criticism as well (Golembiewski 1977; also Nigro 2014).

Frederickson, a participant at the Minnowbrook conference, more recently has organized a "Minnowbrook II" and "Minnowbrook III." In 1968, Frederickson called for a theory of social equity as a "pillar" of public administration. Frederickson was concerned that those in public administration were making the mistake of assuming that all citizens are equally situated, ignoring their varied social and economic conditions (Frederickson 1990). Such an argument, however, does not adequately address the way in which an *administrative*, as opposed to a political, call for equity would legitimately operate in a republic.

The "Blacksburg Manifesto," composed in 1983, expresses concerns that are similar to those at the Minnowbrook but at the same time tries to ground those aspirations in the Constitution and defend them as legitimate concerns of public managers. The Manifesto also emphasizes the importance of the values of equity and equality given the often-dominant influence of a market-driven economy (Wamsley et al. 1990). Hart (1974, 1984) has further endeavored to integrate a concern for social equity within the mainstream of public administration.

More recently, and with similar concerns about equity and equality, scholars have begun to address sexual harassment and related problems. Gooden (2015) examines the social equity scholarship published in the *Public Administration Review* (*PAR*) from 1940 to 2013 and concludes that less than 5% of all articles published in the journal since its inception focus on social equity. She argues that scholars and professionals need to more thoroughly examine issues of procedural and structural inequities. Box (2008) argues that public administrators and managers play a central role in determining which American values are "progressive" and which are "regressive," calling upon officials and scholars to promote the former; though, she may not adequately acknowledge the complications of individual subjectivism and political partisanship.

## The Problem of "Dirty Hands" and "Many Hands"

Walzer (1973) argues that "a particular act of government may be exactly the right thing to do in utilitarian terms and yet leave the man who does it guilty of a moral wrong." In Walzer's view, the problem creates a paradox: the politician must do "wrong to do right."

Walzer and others suggest that the key question is how to punish or hold the dirty-handed official accountable even if the leader who gets his hands dirty does so in the name of citizens and with their implicit approval. If his decision is not democratically legitimate, the problem is an abuse of power, not a moral dilemma. Some argue that neither Walzer nor his philosophical critics recognize that the problem takes a different form in democratic politics (Thompson 1987).

Political ethics assumes that individuals can, in fact, be held responsible for the actions for which they are judged, but the structure of public office may threaten this assumption because many different individuals in an organization contribute in many ways to decisions and policies. Consequently, it is sometimes difficult, even theoretically, to identify who is responsible for what a concern described as "the problem of many hands" (Thompson 1980).

## Ethics Education

As noted, at the founding of the American Republic, moral philosophy was almost without exception of a "core" course for those at the university – and thus, those expected to assume roles of public leadership. In the twentieth and twenty-first centuries, the broad consensus seems to be that ethics can and should be taught (Bruce 2001), and she

also points out that ethics education in public administration was not addressed systematically until 1976 following Watergate. Although Watergate may have precipitated the contemporary emphasis on ethics education, Rohr (1976) warns that it might send educators in the wrong direction since, among other things, (1) the offenders in Watergate were almost all elected or politically appointed rather than career administrators and (2) ethical problems in government are not systemic, accordingly, and education should be directed toward higher-level ethical challenges.

A broader difficulty, suggested already in this essay, is that scholars are not agreed on *what* ethics is; for that reason, consensus on *how* ethics should be taught is hard to achieve. As noted above, in an influential essay, Lilla (1981) argues that the dominance of rational analysis in political science, public administration, and public policy has left educators bereft of the capacity for genuine instruction in moral formation (also see Mayer and Harmon 1982; Hejka-Ekins 1988). Over the past several decades then, several administrative textbooks, or books that may serve as textbooks (as opposed to supplementary texts), have appeared, among which are Geuras and Garofalo (2010), Cooper (2000, 2004, 2012), Bowman and Menzel (1998), Bowman and West (2014) and Denhardt (1988) who more narrowly focus on case studies, or ethical dilemmas, as the pedagogical tool of choice.

An area of abiding interest is in the use of literature to encourage moral formation, a pedagogy that Herbel (2015) argues to employ a kind of literary "case study" that in many instances is richer than conventional case studies and does more to invoke the imagination and thus potentially strengthen individual character. Richardson and Adkins (1997) likewise suggest that the use of literature may be the best means of ethics education; Sommers (1993) argues that the moral dilemma approach should be reserved until later in ethics education after students have received more substance in their education; otherwise, they may only learn casuistry. Holzer et al. (1979) note the rich array of ways in which literature might enrich ethics education. Dobel demonstrates the usefulness of Homer (2006) and Dobel (2015) to illuminate questions of ethical character and performance. Marini (1992) employs Greek tragedy, and Dobel (2015), Edmondson (2006, 2015), Herbel (2015), and Uhr (2015) argue for the utility of the plays of Shakespeare in shaping moral character. Jurkiewicz (2006) demonstrates the relevance and importance of Toni Morrison's fiction in promoting ethical leadership, and Donaldson (2006) explains the significance of the American author Wendy Wasserstein's play "An American Daughter." For a more general study of the political and moral dimensions of Shakespeare, see, e.g., Bloom and Jaffa (1964).

## Ethical (and Unethical) Organizations

William H. Whyte, in 1956, called attention to the baleful effects of the organization on the individual. An important contemporary concern is whether organizations themselves can be ethical or unethical. Cooper (1982) addresses the moral dimensions of the organizational context, and Denhardt (1988) further explores this issue. Cooper argues that the single most salient organizational issue is one concerning organizational hierarchy and culture, both of which frustrate ethical behavior. Mentzel (2015) notes the significance of ongoing research into "ethical systems" and "high-performing organizations." Verhezen (2008) argues that "integrity" is neither the sole possession of the individual nor a discreet quality of an organization; rather, it is a quality produced by a dynamic interchange of values between the individual and the organization. Van Wart and Denhardt explain that improved ethics may require organizational structure change, though such change may bring unintended adverse results (2001).

## Conclusion

It may be that the best approaches to public ethics are comprehensive: Waldo (2000) provides a "map" of sorts that frames the relationship between public administration and ethics. Based on this map, public administrators should have

strong obligations to self, democracy, general welfare, and humanity and, at the same time, embrace strong obligations to the Constitution, laws, organizational-bureaucratic norms, and professionalism. Willbern (1984) suggests that six types, or levels, of morality for public officials exist, involving increasing degrees of complexity and subtlety. Cooper (2012) calls for more systematic collaborative investigation of salient topics in administrative ethics among which he suggests are organizational structure and ethics, social equity, and American ethical concerns considered in a global context.

Mentzel (2015) reviews research on ethics and integrity in public administration in the United States published in the journals *Public Administration Review* and *Public Integrity* between 2005 and 2014 and calls for greater cross-fertilization of ideas and research strategies combining public ethics with various fields including psychology, education, and business. Additionally, he emphasizes the need for such research to be more grounded in methodological rigor. He notes several "research gaps": notably, the effectiveness of ethical training, the new ethical issues raised by technology and information systems, and the growing phenomenon of public and private partnerships (Mentzel 2015).

In conclusion, it may be that for administrative ethics scholarship to proceed productively at least three considerations might be helpful: First, scholars might display a greater awareness of the constitutional limitations of the administrative role; otherwise, some scholarly activity may be largely irrelevant, notwithstanding shifting interpretations of the Constitution produced by changing personalities on federal courts and, to a lesser degree, state courts. Secondly, scholars should recognize when the assumptions behind their work are not just political but partisan. This does not mean that such partisan-inspired efforts are invalid, but it should not be presumed that the reader shares such assumptions. For example, as fundamental as John Rawls work has proven to be, his scholarship is by no means politically neutral; accordingly, any proposals for public ethics that rest upon his work are likewise colored by his political orientation (Rawls 1971). Finally, since ethics is an important and ancient field of study, contemporary efforts might do more to incorporate the moral philosophical tradition. At times, scholarly products, while theoretically interesting, appear to be insufficiently philosophically rooted and for that reason less compelling than they might be. There seems to be ample room for scholars to draw more deeply on classical moral philosophy such as has been demonstrated, for example, by Bok (1989, 1999, also see Fox 2001).

# Ethics and Public Administration

Ola G. El-Taliawi and Isha Dayal
Lee Kuan Yew School of Public Policy,
National University of Singapore,
Singapore, Singapore

## Synonyms

Bureaucratic ethics; Moral responsibility; Regime values

## Definition

Values bureaucrats should normatively possess for effective and moral administration of public service.

## Introduction

The questions of what values public servants should possess to be able to perform their duties, and what moral standards should inform their decisions, lie at the heart of public administration and management debate. This debate can be traced back to the 1800s, with Purinton's seminal work on the Ethics of the State (1897). The study of ethics has been highly interdisciplinary – borrowing concepts, theories, and applications from diverse fields, such as business administration, sociology, theology, psychology, philosophy, and law.

While there is general agreement on the necessity of public servants to undertake government functions in a fair and impartial manner, it has been more challenging for scholars and practitioners to agree on a standard conceptualization of what may be ethical, as well as a mechanism for ensuring ethical conduct in the public service. Therefore, this entry will shed light on this debate as existing in the literature.

## The Importance of an "Ethical State"

The specific importance of discussing ethics in public administration lies in the sheer "power of the government," i.e., its ability to execute orders, generate revenues, penalize offenders, and perform many other critical functions on behalf of the society (Dobel 2005). Since the government carries out these functions through its public servants, the need for ethics and values as a guarantee against possible abuse of power becomes all the more important. Additionally, being the regime's "implementation arm," the executive branch derives its legitimacy from the regime, but its actions also overshadow it. Therefore, any corrupt, partial, or unfair activity would necessarily have ramifications on the governing

regime's legitimacy and trust in the eyes of the people. Therefore, an array of mechanisms has been adopted by governments worldwide, including ethical guidelines and codes of conduct, stressing the importance of bureaucrats undertaking their tasks in a fair and impartial manner (Kernaghan 2003; Van Der Wal 2017). Such ethical behavior on the part of the public administration is said to be important for good and effective governance.

## Bureaucratic Ethics Defined

It is pertinent before embarking on a discussion of public administration ethics to provide an understanding of what these are. Lynch et al. (2007) highlight the existence of three perspectives for conceptualizing bureaucratic ethics:

1. The "virtue ethics" perspective, wherein public servants are expected to apply the traits of a "moral and virtuous" character to their daily administrative functions
2. The "deontological" perspective, wherein public servants should asses their behavior in terms of a dichotomous "right" or "wrong"
3. The "consequential ethics" perspective, wherein a public servant's action is regarded as ethical based on whether it results in the intended outcome – of increasing the utility, satisfaction, and happiness of the citizenry

While "ethics" entail philosophical views on righteousness, morals, and values, for bureaucrats, such prudence is entwined with administrative requirements of efficiency and economy in public service delivery (Frederickson and Walling 2000). In practice, such conduct, deemed acceptable of bureaucrats, is institutionalized as the "codes of ethics" in the public administration.

## The Evolving Debate on Ethics in Public Administration

The debate on ethics in public administration reflects to a great extent the evolution and reform this field has seen over the past decades (Christensen and Lægreid 2011; Maesschalck 2004). According to the classical view, which developed in the liberal democratic regimes in the nineteenth century, what was ethical and moral of public servants was to adhere to the law and implement policies as handed down by elected officials (Dobel 2005). The oath of office, in this case, was seen as the ultimate guarantee of ethical conduct and consequent adherence to the law and the democratic process (Rohr 1979). According to Dobel (2005), this view still holds considerable weight among some public managers, as they see it as a good mechanism for transcending personal affiliations (ethnic, religious, or gender-based) and ensuring impartial service to all citizens.

With the emergence of new public management (NPM) as a school of thought, efficiency became seen as the ultimate driver that should guide public servants' actions in order to maximize public value out of limited resources. Focus on outcomes and oversight, thus, became increasingly important. Contracts were believed to be the solution to enhancing accountability and transparency in government operations (Christensen and Lægreid 2011).

Further down the road, post-NPM advocates called for the inclusion of more equitable and democratic processes in public administration, emphasizing citizen participation and representative bureaucracy as paramount for ensuring an "ethical" public administration (Christensen and Lægreid 2011). As a reflection of this evolution, many ethics guidelines around the world now emphasize democratic values such as responsiveness, representativeness, and openness as hallmarks of good governance (Kernaghan 2003).

## The Paradox of Ethics for Bureaucrats

While ethical conduct in public administration continues to be deemed important, the design and adoption of an ethics framework for public servants have presented more of a challenge to scholars and practitioners alike. Such challenges arise from the difficulty of reconciling paradoxical issues, such as public servants' use of discretion and their differing philosophical paradigms.

### The Dilemma of Bureaucratic Discretion

While adherence to law is seen as important to reduce the threat of immoral conduct and potential infringement by the administration on liberal democratic values, laws are often vague and conflicting in nature. Therefore, public servants usually make discretionary judgments to be able to balance and implement laws, especially at the level of "street bureaucrats" (Lipsky 1980). However, some theorists, especially those who share the classic view, consider this as a problem, since it necessitates the use of one's own cognitive assessment. It also means that public servants have "moral responsibility" over outcomes and process and might guide their judgments according to their "own" set of values. This is considered a potential threat to the supremacy of the law, accountability lines, and liberal democratic values (Dobel 2005).

### The Dilemma of Contrasting Frameworks

In the gray area where laws are confusing or nonexistent, public officers, as discussed, would have to use their discretionary judgment in undertaking the state's administrative functions. Therefore, an additional dilemma for the design of a standard ethics framework originates from public servants' innately different (1) philosophical frameworks, (2) views on public service, and (3) notions of organizational roles.

According to Lewis (1992), a person's philosophical framework determines their decision-making approach in complex situations, whereby they adopt either a "duty/principle approach" by judging situations based on principle or due process or a "results-based approach" by judging situations based on results and outcomes. Additionally, Lewis (1992) argues that individuals have different views of "public service," where some believe that public interests should override private interests, while others prioritize self-interest, rationality, and utility maximization. Moreover, individuals have contrasting notions of organizational roles, where some consider their public service appointment as a position of "trusteeship," where they should act in the public's best interests, whereas others consider their role as that of a "delegate," who should faithfully represent the will of the people (Lewis 1992). Hence, discretionary judgments would diverge greatly between one public servant and another, each according to their own views, values, and philosophical paradigms.

## Examples and Issues of Implementation

Some examples of practices and mechanisms adopted by governments to mainstream ethics guidelines in public organizations include ethical codes of conduct, ethics audits, whistle-blowing programs, ombudsman offices, and anti-corruption agencies. Performance measurements are also sometimes tied with ethical behavior to incentivize public servants to adhere to ethical conduct (Whitton 2001). However, the heterogeneity of public organizations, in terms of roles, size, structure, and functions, makes standardization and implementation of ethical guidelines for public servants a highly complex task (Christensen and Lægreid 2011). In many cases, codes of conduct merely outline the core values expected of a public servant, such as integrity, accountability, and trustworthiness, but do not equip civil servants with the necessary technical ability to recognize and manage an ethical dilemma (Whitton 2001). Therefore, despite efforts to make the bureaucracy more "ethical," there continue to be instances of violations, even in the most transparent and open governments.

## Conclusion

While adherence to ethical conduct on the part of public servants is generally viewed as a pathway to good governance, it has been more challenging for scholars and practitioners to agree on a standard conceptualization of what is "ethical." Notions of ethical bureaucratic behavior have evolved with the evolving public administration discipline. The "ethical" public organization and how to achieve it continue to be the "holy grail" of governments seeking to increase citizens' trust. Some mechanisms adopted to hinder corrupt practices include the adoption of ethical guidelines

and codes of conduct, whistle-blowing protection programs, and ombudsman offices. However, the heterogeneity of public agencies, the reliance on use of discretion by bureaucrats, and the different personal frameworks that guide individual public servants make the application and success of such mechanisms a highly complex and challenging task.

# Ethics and Public Administration in Latin America

Cristian Pliscoff
Institute of Public Affairs, University of Chile, Santiago, Chile

## Synonyms

Corruption; Ethics of civil servants

## Definition

Ethics and public administration in Latin America is the manner in which the ethical dimension of public employees unfolds, in terms of group behaviors, organizational and cultural traits, and individual actions, particularly, related to the presence or lack of corruption and/or integrity.

## Section

Latin America and the Caribbean

## Introduction

The topic of ethics and public administration in Latin America can be analyzed from many points of views. Without any doubt, it is, or it should be, one of the key issues in the public administration domain in the region. The fact that in the last 3 years several presidents of the region have been involved in cases of corruption, and a few of them even have been prosecuted because of the

role they played in the allocation of public resources, is a clear expression of how difficult to address yet crucially important this topic is to the region. However, a lack of ethics is not only an issue in the high levels of leadership in the public administration structure; it is also a matter of how citizens experience this problem on a daily basis, as unfortunately, in many countries of the region, offering bribes, *mordidas*, *coimas*, or *cutras*, and other types of gifts is part of the daily routines that most citizens must carry out in order to either access services in a faster fashion or receive any form of benefit at all. This is a multidimensional problem with psychological, political, normative, sociological, and many other factors that are required to understand the problem.

But the problem of corruption in Latin America is not the only expression as to how "ethics and public administration" takes place. The other dimension refers to the tension public employees have to face in those gray areas where personal, institutional, and national principles are at stake. It is the "ethical dilemmas" domain (Cooper 1998), where public employees face a tension among values on a regular basis in the areas where they work. Public employees have to decide whether to benefit or help one group instead of another in a context of limited resources, to choose one value such as fairness over the other such as justice or equality, or to design a policy that might affect the well-being of a region over the benefit that could yield to the rest. The usual approach to "solve" these ethical dilemmas is to abide by the law and, therefore, to do what the law prescribes. In some cases, this solution can be appropriate from a legalistic point of view, but not from an ethical standpoint.

As one can see from both perspectives, the issue at hand has several dimensions that have to be included when dealing with this topic. The following entry will be developed in three sections. The first section will analyze the issue from a historical perspective. The second section will deal with ethics and corruption. Finally, the third section will provide an analysis of how researchers are addressing this topic in Latin America. Three important journals were studied to know how this topic has been investigated in the region in the last 20 years. These three topics can provide a broad perspective as to how "ethics and public administration" can be manifested in the region.

## Ethics and Public Administration in Latin America: The Context and Its Evolution

In Latin America, since the early days of its independence, the discussion regarding the ethical dimension of public officials' behavior has been linked to the legal aspect of our institutional structure. The traditional framework of the public administration in Latin America is intertwined to law and regulations, because it is in the legal structure of the state where principles and values are expressed. The region belongs to the "civil law" tradition, because of the legacy of the Hispanic influence of the region (Merryman and Pérez-Perdomo 2007). In broad terms, the ethical discussion in public administration has been linked to a legal discussion, regardless of how pertinent or appropriate those norms were.

The conformation of the state, and, particularly, the creation of an institutionalized public administration, was grounded on the notion that public officials should follow the norms and regulations, because they were the expression of the public interest. Using Thompson's approaches regarding the possibility of public officials as ethical actors, the dominant approach toward this topic was the notion of "the ethic of neutrality." According to the author aforementioned, "on this view, administrators are ethically neutral in the sense that they do not exercise independent moral judgment" (Thompson 1985: 556). At the moment they sign the contract with the institution, public officials accept they have to abide by the law, and particularly they have to follow the decisions made by those in the higher echelons of the hierarchy. "The ethic of neutrality portrays the administrator as a completely reliable instrument of the goals of the organization, never injecting personal values into the process of furthering these goals" (Thompson 1985: 556).

The ethic of neutrality in Latin America follows the same rationale with the idea of the

"law-abiding bureaucrat," a dominant concept in this part of the world. Public officials have to abide by the law despite their personal values, principles, or even political perspectives. A public official should follow the norms and regulations, because they are created by the democratic process. In theory, the institutional structure of our public administrations should follow this path.

Unfortunately, in Latin America, we have experienced the extreme expression of the "rule- or law-abiding bureaucrat." There are many cases where public administrators follow the orders of their superiors, being technical and highly neutral in their behaviors, to commit the most terrible horrors against their fellow citizens, such as torture, repression, and other expressions of what is called as "administrative evil" (Adams and Balfour 2005, 2014). For instance, after the end of the dictatorships that took place during the 1970s and 1980s in the region, several public employees were taken to trials because of the terrible acts they committed while in office. Their justifications to do those things were that they were "following orders"; in other words, they were not guilty of what they had done, because they simply did what their superiors asked them to do or because they have to follow the procedures. There are several cases in Chile and Argentina where "administrative evil" can be found in its clearest and most terrifying expression.

After the consolidation of the independence, these newly created states required a modern civil service to avoid the vices and bad practices when political patronage influences public administration. It is the tension that Bowman and West (2008) named as the "political exchange versus civic culture." The political exchange is the expression of the well-known "spoils system" that Wilson (1887) thought as a negative paradigm to follow due to the social costs it engendered. The political exchange "is premised on contracts, favors and jobs in exchange for political support; it is susceptible to corruption because it feeds an environment of cronyism, sycophancy, favoritism and waste" (Bowman and West 2008: 181). On the contrary, the civic culture perspective rests on the idea that public officials should follow the public interest and avoid practices that should benefit a few instead of the majority. The consolidation of the civic culture approach is consistent with the consolidation of the "modern civil service," similar to the one developed in England in the late eighteenth century. "Modern civil service were a unified service, open competition for entry and promotion based on merit; a career service; and separation of private and public life" (Vandenabeele and Horton 2008: 10). The ethical standards of those working for the state are clear and should be followed when facing ethical dilemmas.

In Latin America the dichotomy in terms of political exchange and civic culture is not fully applicable. The reason refers to the fact that the evolution of the state in the region has been quite different among the countries that form this area of the continent but also because the region has a particular manner in which the institutions of the state, particularly its public administration, have been implemented. First, the diversity in terms of consolidation of the institutional dimensions of the state stems from the early independence of our countries. According to Oszlak (1978), the formation and consolidation of the state in the region depended on the level of economic development, the existence of a nation, and the capacity for social control. When those factors were present, the likelihood of having a strong and consolidated state was higher. The difference in terms of time for having a consolidated state had an impact in the consolidation of an institutional structure where public employees could perform. As a matter of fact, it is difficult to assert that any country in the region has reached, at some point of its evolution, a level of "civic culture" that could allow the total separation of politics and administration. On the other hand, cronyism, clientelism, and other ill-defined expressions of a lack of civic culture have been present in different degrees in the region.

The problem is that in a vast part of the late nineteenth century and almost the whole twentieth century, Latin American states have tried to implement the "civic culture" paradigm, rooted in a Weberian bureaucratic model of public administration. As a matter of time, Cortázar

Velarde et al. (2014) showed that in the region there is, in theory, a Weberian state. One could say we live in an "apparent state" and we have rules for hiring public employees on a basis of merit, but it is well known that an important number of those processes are already *arreglados* (predetermined). Procurement mechanisms exist, but by the power of those in charge, only a few providers are allowed to offer the goods or services being required. The "apparent state" is an expression of knowing that hiring someone without a merit-based process is against the formal principles of the system, but it does not mean that the person in charge can jeopardize the possibility to hire someone from "our group," political party, or similar.

In some sense, the political elite requires the "apparent state" to show citizens that there are rules, values, and principles for the public administration to work, but in reality, they use the state for their own benefit. This is why the problem is extremely difficult to address, because it is not a matter of lacking of laws and regulations, it is a matter of lacking a "civic culture." When studying this topic with a comparative approach, one can be astonished by the creativity of law dodging and rule bending in the region and, in particular, by the use of a particular lingo to refer to these practices. Only three examples can be useful to show this phenomenon. In Colombia, the expression *mermelada* (jam or marmalade) refers to the ability of governments to "spread" public resources to benefit those supporting the government. In Argentina, the expression *ñoqui* refers to a public employee that is hired in a public institution without having a specific task or duty to fulfill, usually, because she supports a political party or leader in particular. In many countries of the region, there are different expressions for hiring someone without the merit or the skills required for the position, such as *pituto o cuña* (Chile), *cuello* (Guatemala), or *botella* (Dominican Republic). These examples show that the same rules that can be used for good purposes can be adapted to ill-defined intentions.

In the late 1980s and early 1990s, the discussion regarding ethics and public administration changed. The main reason for that is the implementation of the new public management (NPM) style reforms in the public sector (Hood 1991). The region faced similar trajectories (Pollitt and Bouckaert 2004) to those implemented in Europe, the USA, and other parts of the planet (Oszlak 2015). Deregulation, privatization, decentralization, and public–private partnerships among other new administrative doctrines were implemented in the region with different results and outcomes. Overall, this process produced new problems in the ethical domain because it created new, and very lucrative, areas where public employees had to negotiate with private companies. But also, the motto "let the managers manage" meant that deregulation was a fashion that many countries had to follow, with all the risks of using public funds without proper controls. Ramio (2001) showed that this process had different outcomes according to the dominant administrative culture public administration had at the moment of implementing these new doctrines. In spite of the different consequences of the implementation of NPM in the region, it is possible to say that these new doctrines have had an impact in the ethical dimension of public administrations. For the Chilean case, Pliscoff (2017) showed how new administrative doctrines have an impact in specific cases.

After the arrival of a new century, in the context of governance and open government movements (Kooiman 2003; Lathrop and Ruma 2010; Pierre and Peters 2005), public administrators in Latin America are facing a new model regarding how ethics should be understood. Transparency, participation, and collaboration are reshaping how public administrators should behave. The ethical standards are higher, because the society is more aware as to how and why public employees make decisions. A major thrust for this new environment has been the freedom of information (FOI) regulations that have "opened" the state allowing citizens to see how the state is functioning. The creation of the Instituto Federal de Acceso a la Información (Federal Institute for Access to Public Information) in Mexico in 2002 with the enactment of the Ley Federal de Transparencia y Acceso a la Información Pública Gubernamental (Federal Law for Transparency and Access to Public Information) is a milestone

in terms of easing access to the state and therefore to public employees. These types of regulations, along with a more active press and civil society, can control the actions of civil servants making it more difficult for them to hide and to remain untouched when committing corruption, but also, they create a new environment for decision-making in the ethical domain.

New ethical dilemmas also arise with the tendency to use citizen participation in the public domain. It is well supported in the literature that in the last 20 years, several forms of citizen participation have been implemented in public institutions (Fung 2006). These new modes of relationships between citizens and public officials create a new set of gray areas where ethical dilemmas can happen. Unfortunately, the idea of a citizen-centered public administration (Cooper et al. 2006) is still embryonic in this part of the world, due to a civil society with limited resources and lacking the capacity of other parts of the world. Usually, when a participatory device is installed, the participation is limited to those with more capability to participate and/or with more resources. In this context, public officials could benefit those more active vis-à-vis those without the capacity to participate. Are they acting ethically if they make decisions benefitting only a group of the society instead of the majority?

## Ethics and Public Administration in Latin America: The Problem of Corruption

In spite of the dominant models regarding how to understand the ethical dimension of public administration in Latin America, it is impossible to discuss about this issue without thinking about the problem of corruption in our region. The simple action of checking the newspaper in any of the countries of the region will show, with more or less intensity, how relevant the issue of corruption is in this part of the world. Yet, this analysis could lead us to simplify a very complex phenomenon and to misunderstand the causes and consequences of this problem. In terms of definition, corruption will be understood as "behavior which deviates from the formal duties of a public role because of private-regarding (personal, close family, private clique) pecuniary or status gains" (Nye 1967: 419). It is far from the purpose of this entry to fully analyze the phenomenon of corruption; therefore, a couple of elements will be presented to show how this problem unveils in the Latin America.

There are different sources to have a clear picture of the phenomenon in the region. As a starting point, the Corruption Perceptions Index developed by Transparency International shows that the problem of corruption in the region lacks a unified expression. Table 1 shows the positions of the countries in Latin America in the 2017 ranking. The higher the position of a country in the ranking, the worse it is in terms of corruption. There is an important difference between those in the top three places of the region and the rest. There are at least three groups of countries: Uruguay, Chile, and Costa Rica in the top 40 of the ranking; Argentina, Brazil, Colombia, Panama, and Peru around the position 100; and the rest below that position.

Yet, this diversity in terms of the perception of the problem should be complemented with two pieces of information that provide interesting elements regarding the problem of corruption in the region. The Latinobarómetro, a poll applied in the region regarding different issues, includes a couple of questions that are useful to grasp the real characteristics of the phenomenon in the region. In particular, the results of these two questions portray a certain dichotomy regarding the problem in terms of the difference between perception and reality. The following table is the result by country of the answer to the question: "How many of public employees you think are involved in corruption, or you do not have enough information to provide an opinion?" (¿Cuántos de los empleados públicos piensa Ud. que están involucrados en actos de corrupción, o no tiene suficiente información para opinar?) The results are consistent in terms of the idea that "some" or "almost all" are corrupt. There is a general perception that public employees are corrupt (Table 2).

But the previous table when combined with the following raises questions as to how perception and reality sometimes do not match. When asked "In the last 12 months, have you ever tried to get

an identity card, a birth certificate, a driver's license, a passport, a voting license, or a state permit? How often have you ever paid a bribe, provide a gift, or make a favor to a public employee to obtain what you were looking for?" (En los últimos 12 meses, ¿Ha intentado Ud. obtener un documento de identidad, como un certificado de nacimiento, licencia de conducir, pasaporte, tarjeta de votante o un permiso del Estado?. ¿Y cuán a menudo ha tenido que pagar

un soborno, dar un regalo o hacer un favor al empleado público para obtener el documento que necesita, o no lo ha hecho nunca?) Table 3 provides the results, which are interesting as they do not show a regular experience paying for getting public services.

Only Mexico and the Dominican Republic have a percentage higher than 10% of the people saying they have had to bribe a public official one or two times in order to get an official document. Further research is required to understand the gap between experience and perception in this area in Latin America.

In some countries of the region, it has been said that there is room for what is called "systemic corruption." This is a higher level of corruption where almost every single institution in the public administration structure is "touched" by corruption. According to Arellano Gault et al. (2015: 78), systemic corruption is "when in almost every public organization someone can access the corruption network or even there is the normalized expectation to acquire an informal benefit from users and members of public organizations." Unfortunately, in many countries of the region, particularly those in the lower levels of the Corruption Perceptions Index, systemic corruption is the rule.

## How to Curb Corruption in Latin America?

The problem of corruption in the region remains to be one of the key problems for the citizens of the region. As previously stated, the perception of corruption is high, even though the experience of corruption is low. Yet, how governments in the region are dealing with the problem of corruption is another element to bear in mind when addressing the issue of "ethics and public administration in Latin America."

There are two approaches the government take regarding the strategies to address this issue. The first approach refers to reaction to corruption scandals. Usually, after a corruption scandal is unveiled, the government and the political elite tend to react and to propose changes to address or overcome the situation regardless of how

**Ethics and Public Administration in Latin America, Table 3** Results regarding how often a person has to bribe in order to get an official document in the Latinobarómetro poll 2016

| | Never | Once or twice | A few times | Often | Do not have contact | Do not know, do not answer | (*N*) |

Source: Latinobarómetro 2016 (http://www.latinobarometro.org)

involved are political actors in the situation (Balán 2011). The role of scandals in public policy has been highly studied in the public policy literature (Kingdon and Thurber 1984; Maesschalck 2002). Therefore, taking corruption as a policy field, the outcome of the strategy should not be different from other areas such as education, public works, or health.

The cases of the National Commission Against Corruption created in Peru in 2018 after the "Lava Jato" case and the Presidential Commission Against Conflict of interests, Influence Peddling, and Corruption (also known as the Comisión Engel) in Chile in 2015 are examples of actions government took to improve the legal framework against corruption along with other administrative measures. It is not always the case that these commissions have a real impact in changing the situation regarding corruption. Sometime these initiatives are seen as a scapegoat to show interest in changing a situation, but not having a clear commitment with the issue.

A second strategy that can be pointed out as a road to address the topic of corruption is to create administrative devices, such as secretaries, ministries, autonomous bodies, or other similar entities, to curb corruption using different approaches. In some cases, these entities are the outcome of commissions such as the ones mentioned in the previous paragraph. In other cases are the initiatives of a government in office interested in tackling the problem. The creation of the National Anti-Corruption System in Mexico in 2016 is an example of a new approach the government has taken to address the issue of corruption.

Regardless of the strategy to curb corruption, it is crucial for the region to develop a multidimensional approach regarding the topic. The traditional "low road" of changing regulations or creating organizations and using a "compliance approach" to address the issue of corruption should be changed to an "integrity approach" or "high road" (Rohr 1989). The second type of strategy creates better in-depth interventions to change individuals to an ethic behavior, not because they could or might be punished but because they ought to behave ethically. "An integrity approach is based on the concept of self-governance of employees in accordance with a set of guiding principles within the organization and their environment" (Lawton et al. 2013: 118). But also, having isolated actions and measures cannot be a fruitful path to address such a complex phenomenon. Improving regulatory agencies, providing autonomy to judges and comptrollers, and fostering ethical commitment among civil servants, among a long list of other actions, are required to break with the problem of corruption. Governments, the political elite, civil society, academia, and the private sector should all be working together to reach agreements for having an environment where corruption should not be tolerated anymore, not only because of the economic and social costs but also because it is a concrete threat for the democratic state in Latin America (Rehren 2009). This broad consensus is required for addressing such a complex societal challenge.

## How Are We Studying Ethics in Public Administration in the Region?

This final section is intended to show how scholars and researchers in Latin America are studying the issue of this entry. It is clear that this issue can be addressed in different outlets. Journalist, politicians, practitioners, and others write about how ethics unfolds in real life. In this section, the focus of analysis will be the work of scholars and researchers published in three of the most important academic journals of our domain. The journals are *Reforma y Democracia*, *Revista de Administração Pública*, and *Gestión y Política Pública*. These journals are included in the most important scientific databases but also have the highest prestige in the region.

The method to address the question at hand was to analyze the publications of these three journals in the last 20 years to see the level of interest in the topic and to show how the topic has been studied. All of these journals have been published on a regular basis for that period of time. In the case of *Reforma y Democracia*, the journal publishes three issues per year with a total of five to seven articles per issue. *Revista de Administração Pública* publishes six issues per

year with a total number per edition of more than eight articles, up to ten in some cases. Finally, *Gestión y Política Pública* publishes three issues per year, with an average of six to seven articles per issue. Each issue was analyzed to assess whether or not it deals with a topic linked with ethics and public administration. The categories developed by Menzel (2015) were used to arrange the articles and to assess whether or not the articles fit in those categories. The only modified category was "globalization," because in this case it was not relevant for the analysis. Due to the particularities of the publications in our regions, a new category called "normative" was included which encompasses articles studying ethics in public administration from a normative and even philosophical purview.

In 20 years of publications, a total of 62 articles deal with ethics in our academic domain. The distribution of articles among the journals is the following: 16 were published in *Gestión y Política Pública*, 26 in *Reforma y Democracia*, and 20 in *Revista de Administração Pública*. Graph 1 shows the results of the articles in each of the three journals being analyzed.

The distribution of those articles per year is presented on Graph 2. The reason for the unusual number of articles in 2001 is that one of the journals published a special issue in ethics and corruption. For the rest of the years, the tendency is similar ranging from one to five articles.

Yet, what have researchers published about in the last 20 years? To show the different types of articles, the categories proposed by Menzel (2015) are used. After an initial classification of the articles, small changes had to be made. There were a group of articles that did not fit any of the categories presented by the author. Therefore, a new category called "normative" was included to encompass all the articles that provide a normative approach regarding this issue, without using any type of empirical data to support their argument. Graph 3 presents the number of articles per category.

The distribution of articles provides an interesting picture regarding what are the most developed topics in the region regarding ethics and public administration. By far, the category "ethics law and regulatory agencies" that includes articles dealing with corruption and regulations is the most important of all types of categories, with a total of 27 articles. The second group is "ethical environment" with 13 articles dealing with transparency and accountability. The third group of articles is the one dealing with normative aspects of ethics in the public sector. It includes a total of nine articles presenting global discussions regarding the issue and philosophical debates about the sources and implications of ethics in the public administration domain. The fourth category "policy integrity" includes seven articles that focus their attention on the ethical implications

**Ethics and Public Administration in Latin America, Graph 1** Number of articles regarding ethics in public administration in three major journals from Latin America

**Ethics and Public Administration in Latin America, Graph 2** Number of articles per year

**Ethics and Public Administration in Latin America, Graph 3** Number of articles per category

of public policies, using case studies to address the topic. Four articles study the "ethics and management" category dealing with topics such as public values, climate, and organizational culture. Finally, only one article addresses the issue of "ethical decision-making," which applies the Stewart Sprinthall Management Survey (Stewart et al. 1997) to the Chilean case, and another article falls under the category of "organizational performance," but without providing an empirical approach regarding the issue.

The fact that the category "ethics law and regulatory agencies" is the most important in the region can be explained by the relevance the topic of corruption has in this part of the world. As the previous section showed, corruption is a key problem in our societies; therefore, researchers address the issue in order to explain and understand the phenomenon. If one compares this reality with the one presented in the USA, by the work presented by Menzel (2015), the number of articles per category is quite different (Graph 4).

Further analysis is required to have a better understanding of these differences in terms of academic work regarding ethics and public administration. However, it is interesting to show the relevance the "compliance approach" has in terms of academic work in Latin America, showing how important this dimension is in the discussion about ethics and public administration.

## Conclusions

As it was shown in this entry, the topic of ethics and public administration has several implications in the region. It has evolved since the early days of the independence of the region, when public administration institutions were formed, to the current open government environment. Public officials have faced ethical dilemmas all the time, and not always the environment has been the appropriate for values and principles to justify their behaviors. The traditional "compliance approach" has placed too much attention on controlling the misbehavior of public officials, leaving less time for strengthening their values and the so-called public sector ethos (Norris 2003). Corruption is still a problem in the region; therefore, new strategies should be put in place in order to tackle it and create a new environment where ethical standards are not the exception but the norm among public employees. Critical among those strategies is strengthening the state, with strong institutions. This means a transparent and professional public administration, with well-paid, or at least adequately paid, public employees, with the social recognition they deserve and with organizations working for citizens, instead of doing it for a group of the society. This will not be enough, if politicians and other actors do not agree on the need for a better state. Moving to an "integrity approach" is required for encompassing all the nuances a problem like this has.

But the academia has to play a role in this debate as well. More research is required to understand the phenomenon but also to suggest the best options for improving ethics and curtail corruption. Limited research has been undertaken so far in Latin America, and more is required to understand whether or not the decisions made in the region have been appropriate or not. It is particularly relevant to be suspicious about the fads and fashions that every now and then arise as "the" solution to curb corruption or other objectives. Scholars should help in fighting isomorphism (DiMaggio and Powell 1983), particularly, the one that adopts an organizational measure, without adapting to a particular environment. Practitioners and scholars should work hand in hand to foster public integrity, based on the particularities of Latin America.

## Ethics and Public Policy

### Synonyms

Ethical codes; Kantianism; Morality; Professionalism; Public decision-making; Utilitarianism; Values

### Definition

*Public policy* may be defined simply as the formal and informal courses of action or procedures that governments undertake or intentionally choose not to undertake. While there are many more sophisticated definitions available, this one focuses attention on government actions or government choices to take no action and avoids discussions of government officials' or politicians' claims about future plans.

*Ethics* can be defined as standards of right and wrong that specify what individuals should do. Such standards are typically derived from (1) principles that form the basis for behavior, (2) a consideration of the benefits (or harms) that come from taking action, and (3) qualities that define a "good" person. In public administration, a fourth source is also often used, duty or the behaviors expected of an individual as a result of his or her role.

### Introduction

The most common approach to public policy is to view it as an exercise in problem-solving. Specifically, elected officials, assisted by public administrators, develop approaches to address public problems and then put them into effect. This simplistic view ignores the political processes involved in identifying and defining problems, proposing solutions, and then putting them into action. Worse, this view assumes that public problems can be neatly defined, solutions are readily available, the impact of those solutions on humans is known, the process is rational, and political agreement along with the will to execute policy choices exists. Most significantly, the problem-solving approach ignores the myriad of ethical questions and dilemmas that face those individuals participating in the policy process.

Is a given public policy ethical? From the standpoint of ethics, public policies are typically evaluated either in terms of their conformity with principles or the consequences of the policy. If one adopts the principles-based (also known as deontological) approach, a policy can be evaluated based on whether it meets a society's generally accepted principles of right and wrong, such as equal treatment before the law. Alternatively, one can evaluate a policy based on the results (also known as consequentialism) or consequences it actually achieves.

However, it is also possible to examine a given public policy at three different levels. First, one can focus at the broadest level and look at the *policy* itself. Second, attention could be placed on the *process* used to make the decision to enact a particular policy. Finally, one could examine the ethical issues that arise as part of the *implementation* of the policy. The remainder of

this article will be organized following this pattern. To assist the reader, examples will be used from a current, at the time of this publication, public policy/ethics controversy – the Flint, Michigan, water crisis – to illustrate the deontological and consequentialist approaches to ethics at each of the three levels.

## Flint, Michigan, Water Crisis

In 2011, the governor of Michigan appointed an emergency manager to take over the city in response to its fiscal crisis. Decades of shrinking population and industries moving out resulted in a much smaller, poorer city dealing with financial obligations made when the city was larger and more prosperous. As part of cost-cutting measures, in June 2013, the city council and the emergency manager chose to take the city off the Detroit water system and draw water directly from the Flint River.

Residents began complaining about the taste, smell, and appearance of the Flint River water almost immediately after the switch. But Michigan's Department of Environmental Quality (MDEQ) and Flint water officials repeatedly claimed there was nothing wrong with the water. A medical study done by Dr. Hanna-Attisha confirmed that levels of lead in the blood of children had almost doubled after the switch in water source. In September, a research team from Virginia Tech led by Dr. Marc Edwards confirmed that the corrosive nature of the water from the Flint River was leaching lead from the inside of water pipes, causing the higher levels of lead in residents' blood. Throughout, MDEQ and Flint water officials denied there was a problem, challenged research results, and even submitted false test results. A whistle-blower inside the regional Environmental Protection Agency (EPA) office, Miguel Del Toral, pushed the EPA to take action but was largely marginalized. Once results from the Virginia Tech study became public, MDEQ and Flint water officials finally admitted there was a problem with water quality, corrective action began. Readers who want to learn more detail about the Flint River water crisis should go to http://flintwaterstudy.org/.

## Is the Policy Ethical?

All public policies have ethical implications. This is so because a public policy embodies the value preferences of its proponents. Moreover, because it is "public," once enacted, a public policy impacts human beings in some way, positively or negatively, directly or indirectly (Gawthrop 1998). A straightforward example is the Nazi policy of exterminating the Jewish population during WWII known as "the final solution." This policy reflected the value preferences of the Nazi elite (specifically, their belief in Aryan supremacy and the inferiority of all others, especially Jews) and led directly to the deaths of six million Jews. Taking a principles-based approach, the final solution clearly violates the widely accepted value that human life should not be taken except in limited circumstances (such as self-defense). From a consequentialist viewpoint, the policy's deadly impact on the Jewish community in Europe makes it clearly unethical. However, analyses of most public policies typically do not yield such clear-cut results.

To begin with, public policy is the result of some political process. All political processes involve both conflict and compromise. Compromises can, and often do, produce public policy that is vague or even contradictory in an attempt to satisfy the parties involved. In such cases, it can be quite challenging to examine a policy's ethical implications prior to implementation.

Moreover, public policy often yields mixed results making an examination of the consequences frustrating. As noted earlier, the problem-solving approach to public policy means government often attempts to "solve" a social problem by trying to influence or induce change in human behavior. However, human behavior is quite complex and highly adaptive; social scientists cannot with any level of certainty predict in advance how individuals or social groups will respond to any particular policy initiative. Thus, a given policy may lead to an improvement for some individuals or groups while having neutral or negative impacts on others. And any or all of those consequences may be unanticipated.

In the Michigan case, public law (PA 436) provides for a state-appointed emergency manager to take over a city or school district when a financial emergency exists. A declaration of financial emergency is made only after a lengthy review process, and the entity's elected representatives decide whether or not to accept a state-appointed emergency manager or pursue one of three other options. From a principles-based approach to ethics, such a law satisfies citizen expectations that the government behaves responsibly and prudently with public money. From a consequentialist-based approach, the majority of citizens in Michigan benefit as they are protected from being forced to pay more taxes to cover the costs of (potentially) profligate elected officials or irresponsible administrators in other jurisdictions. However, it is also clear that a minority of citizens (the residents of Flint) suffered from choices elected leaders and public administrators made as part of implementation.

Like a Russian matryoshka (nesting) doll, a policy can be seen as a series of interlocking decisions that begin with the political process and end with implementation. Thus, to evaluate a public policy from the standpoint of ethics, one should not focus exclusively on the policy. Rather, it is essential to consider the decisions made throughout the policy process, including the political process used to make the choice to pursue a particular policy option and how the policy was actually executed or implemented.

## The Political Process

The decision to pursue a particular policy option is a political decision. All regimes, whether authoritarian or democratic, seek legitimacy. That is, all political regimes want their citizens to voluntarily accept them. Regimes seek legitimacy as a way to reduce the costs of policing the population and increase the odds the ruling class (elected or otherwise) will be able to enjoy the privileges that come with ruling. Thus, regimes typically seek ways to ensure their policy choices are viewed as legitimate.

Many factors affect the perceived legitimacy of a government, and there is not enough space here to examine them all. But one way in which legitimacy is linked to ethics is through basic perceptions about the "morality" of the regime and its decisions. If the regime is viewed as legitimate, citizens will believe it is morally correct (ethical) to accept and obey the regime's decisions. It is in this way that a connection can be made between legitimacy and ethics.

In looking at a public policy decision process, two considerations seem paramount for the ultimate decision to be seen as legitimate and therefore ethical. The first consideration concerns affected citizens' ability to participate and actual participation in the process. The second consideration deals with the openness or transparency of the decision process. Specifically, affected citizens need access to the information necessary to make an informed choice about the policy and be able to effectively participate.

Citizens and outside observers can have quite different perceptions about the legitimacy of a policy. From the citizens' standpoint, their *perceptions* determine whether they choose to regard a policy as legitimate. Do those affected by the decision believe they can in some way influence the outcome? To the extent they believe they can, they are liable to accept the policy as legitimate and, therefore, will see obedience as the morally correct response. Similarly, if the citizens believe the decision process was open or fair, they will probably accept the policy as legitimate.

Outside observers, however, who are interested in evaluating a policy should look carefully for more information. Specifically, they should seek data concerning the *actual* decision process, including the ability of those affected by the policy to *meaningfully participate* in the process of choosing and the access of those individuals to *all* information needed to make an informed decision. Simply because a democracy exists does not guarantee that these two considerations will be met.

A wide range of factors can limit meaningful participation in policy decisions and, therefore, raise questions about the legitimacy of the decision. In the context of US politics, the involvement of special interest groups and the wealthy in political processes often raises questions about the ability of ordinary citizens to meaningfully

participate in the policy process. Many nations have an identifiable minority group (religious, racial, ethnic origin, language, culture) that is excluded from meaningful participation in politics. Restrictions on news media, a tendency to classify information as "state secrets," or a population that lacks access to communication systems can all inhibit the ability of individuals or groups to get the information essential to participate in the public policy process.

For example, in the case of Flint, Michigan, the decision to take the city off of Detroit water was made by the elected city council by a 7-1 vote, a decision approved by the city's emergency manager. Since the city council voted on the decision, and members of that council were chosen by the citizens of Flint through the electoral process, one could conclude that the people affected (the citizens of Flint) had participated through their representatives in the decision to use Flint River water. However, city council members apparently were not fully informed about the potential health risks, nor were they advised that the MDEQ had told Flint water officials it was not necessary to use corrosion control techniques (to keep lead out of the water) for a year. Simply put, the city council which represented the people most affected by the decision does not appear to have had access to all the information needed to make a truly informed decision. This lack of transparency, coupled with the real and potential health impact of the decision, left the citizens of Flint feeling not only angry but as though their own government had betrayed them.

According to Svara (2015), public administrators have eight basic responsibilities. One of those is a duty to provide elected officials with all the information needed to make informed decisions, including information that may not support the known preferences of those elected officials. Looking at the decision process in the Flint case from a principles-based approach, one can conclude that administrators in MDEQ and the Flint water utility failed to provide elected officials with the information necessary to make the best decisions, a primary duty of public administrators. From a consequentialist approach, the result of not providing accurate, timely information to the Flint City Council was a bad decision that may have long-lasting, negative impacts on the health of citizens.

## Implementation

When public policy involves taking action to address an identified problem, implementation emerges as a central concern in any discussion of public policy and ethics. The responsibility for implementation of public policy rests with those public administrators who create and man the organization that will carry out the policy, develop the instructions that will guide its day-to-day operation, and interact with the citizens who will (hopefully) benefit from the policy.

Modern government has adopted the bureaucratic model first described by Max Weber (1973) as the most efficient and effective form of organizing large numbers of people to undertake government work. In the bureaucratic model, emphasis is placed on specialization, consistency, compliance with rules, and efficiency. But while bureaucracy has many benefits, it also has a number of flaws that can lead to unethical behavior at either the individual or the group level.

### Individual-Level Concerns

For example, bureaucracy's emphasis on rules compliance creates two problems. Robert Merton (1957) noted that the emphasis bureaucracies place on compliance with rules leads public administrators to elevate obedience to primary importance, even above helping the citizens their agency is supposed to serve. This can lead to administrators carrying out policies that are harmful to individuals or groups or denying help to those who may need it in the name of "following the rules."

This emphasis on compliance and obedience leads to a second problem. Cooper (1998) argues that public administrators are accountable to supervisors, the elected officials who oversee the agency's work, and the citizens they serve. Administrators, however, are likely to focus attention on their accountability to the supervisors they encounter on a daily basis and pay much less

attention to more distant elected officials and the citizenry who have only the most limited ability to hold administrators accountable for their decisions. Thus, they are likely to do what they are told to do by their supervisor, even if that may be harmful to the citizens they are supposed to serve.

Beyond the problems caused by a compliance mentality, the modern bureaucracy is characterized by what Adams and Balfour (2009) refer to as a scientific-analytic mind-set. In this mind-set, individuals approach their work focusing on the technical aspects rather than the real or potential human impact, increasing their propensity to make unethical choices. Thus, an administrator might place their attention on the proper interpretation of a regulation rather than how the various interpretations would affect individual lives.

This mind-set is buttressed by the specialization, diffusion of responsibility, and compartmentalization typical of government agencies. Specialization, diffusion, and compartmentalization create an environment where it is difficult to determine who is responsible for any given decision or outcome, making it much easier for unethical individuals to hide their misbehavior. But even well-meaning administrators can suffer from this structure. Ultimately, modern bureaucracy separates decisions from consequences in a way that allows individuals to make choices that may seem rational and appropriate but can have devastating impacts on others and their communities (Jurkiewicz 2012).

In the case of the water crisis in Flint, it seems clear that the primary mission of MDEQ and the Flint water utility is to protect individual citizens from the health risks associated with bad water. However, individuals working in MDEQ and the Flint water utility clearly were focused on the technical aspects of their work – and compliance with what they believed were the requirements of environmental law – not on prevention of lead poisoning. The subsequent arguments, carried out via e-mail and exposed in the press, over who was responsible for the water crisis illustrate how challenging it can be to establish accountability and responsibility in a modern bureaucracy.

Svara (2015) lists as the first responsibility of public administrators the obligation to put the public interest above the interests of the individual administrator or his or her agency. Thus, from a principles-based approach, administrators in MDEQ and the Flint water utility violated the primary duty of any public administrator to put the public first. Instead, administrators were focused on the technicalities of legal compliance and the need to cut costs. From a consequentialist standpoint, the result of that focus was a bad decision that put the health of thousands of people, including children, at risk.

### Group-Level Concerns

At the group level, two concerns about bureaucracy can be clearly linked to ethics. The first is known as bureaucratic autonomy. The second deals with organizational culture, specifically the possibility of an organizational culture that fosters and/or encourages unethical behavior.

Bureaucracies have missions, and the administrators who staff them typically believe in that mission. The result is the tendency for administrators to become very loyal to the agency they serve – and very defensive of its prerogatives, privileges, and actions ("turf battle" or "turf war"). Unfortunately, many problems governments face require multiple agencies or levels of government to work together to carry out a solution – and its associated public policy. In the case of the water crisis in Flint, Michigan, this phenomenon can be seen in MDEQ's public attacks criticizing the work of outside researchers documenting the health hazard to citizens and Flint water officials submitting false test results to EPA as part of efforts to defend their agencies. The "turf battle" problem is illustrated in the memorandums and e-mails going back and forth between the MDEQ and its federal counterpart, EPA, arguing over what should be done, by whom, and how in response to outside reports confirming the existence of a health hazard from the use of Flint River water.

But bureaucracies also have organizational cultures – cultures that can foster or even encourage unethical behavior. In its ultimate form, organizational evil, the organizational culture may have a set of principles that actually has as its purpose harming others, with no regard for any consequences beyond the benefits the organization and its members may receive from the unethical behavior (Jurkiewicz 2012). In the case of the Flint water crisis, there does not seem to be

an ethic of evil. But clearly, there was a culture that felt it was appropriate to falsify test results and attack the work of concerned researchers to protect the organization.

## Introduction

For the past century, scholarly discourse concerning public administration has reflected an ethos suffused with an array of ideals enabling public administrators not only to make sense of but also to commit themselves to that ethos. Where those ideals are normative – a professional ethos, for example – they motivate or mandate conduct on the part of those whose desire is to participate in or to shape their lives according to those ideals (Reynolds 1993). This decision, when made by public administrators motivated by normative ideals – in particular, ethical principles and religious morals – triggers this discussion concerning ethics and religion in public administration (Brewer et al. 2000; Crewson 1997; Houston 2000, 2006; Jurkiewicz et al. 1998; Perry and Wise 1990; van Loon et al. 2015; Wright 2001).

This survey discusses first, ethics and public administration, and second, religion and public administration. Three critical matters arising from these discussions will then be considered if scholars are to become more inclusive by not contemptuously dismissing ethics and/or religion from their inquiries or by pitting either or both against science, but instead, to consider how ethics and religion might inform and expand the study of public administration, as social scientists once did (Tönnies 1964; Weber 1968, 1992).

## Ethics and Public Administration

Similar to an ocean's tide, scholarly interest in ethics and public administration during the past century has ebbed and flowed. The tide rose in the 1940s with the Friedrich and Finer debates (Stewart 1985) and then ebbed, although Leys (1943), Appleby (1952), and Bailey (1964) made contributions. The tide rose again in the early 1970s, only to ebb yet rise again in the mid-1980s and early 1990s as the number of national conferences, course offerings, and literature devoted to the topic increased (Adams 1994, p. 292; Bowman et al. 2001, p. 194). The *Handbook of Administrative Ethics* explicates seven

areas of scholarly interest across those decades: administrative ethics as a field of study; philosophical perspectives in administrative ethics; contexts of administrative ethics; maintaining ethical conduct (external and internal controls); administrative ethics in American society; and, administrative ethics in other cultures (Cooper 2000).

From the beginning, one force influencing this tide was the assumption that adding a "fourth 'e' – ethics – to the holy trilogy of efficiency, economy, and effectiveness" (Menzel 2007, p. 10) would reform government and restore public trust in it (Thomas 1998; Vigoda 2000; Vigoda-Gadot 2007). To this end, the literature highlighted ethical values, ethical leadership, teaching ethics, and standards associated with professional ethics.

### Ethical Values

A number of values shape a public service ethos and are believed to motivate public administrators to conduct themselves ethically (Kalu 2003), including among others: accountability, collegiality, integrity, impartiality, loyalty, equality, and dedication to a public rather than private interest or self-interest (Brereton and Temple 1999; O'Toole 1993; Paine 1994; Rayner et al. 2011).

Others have argued that lofty ideals – like the "common good" – motivate public administrators to conduct themselves ethically. Yet others have maintained that professional codes provide the motive. O'Toole (2006) observed how, over the past several decades, the management skills and business-like methods associated with the New Public Management (NPM) supplanted lofty ideals. The result is "the ideal of public service and public service ethos inspired by it. . .have ceased to play an important part in public life" (p. 100).

Questioning all of this, Perry et al. (2010) wonder whether personal, subjective values predispose individuals to dedicate themselves to public administration and, once employed, to conduct themselves in ways reflecting public sector values.

### Ethical Leadership

Ethical leadership is generally defined as "the demonstration of normatively appropriate conduct through two-way communication, reinforcement, and decision making" (Brown et al. 2005, p. 120).

Surprisingly, little mention has been made of its ethical dimensions (Treviño et al. 2003). Ciulla's (2004) review of 1,800 abstracts from seven disciplines confirms this finding. That said, Bowman et al. (2001) identify four "pillars" of public administration ethics: (1) value awareness; (2) ethical reasoning skills; (3) the role of law; and, (4) organizational implementation (p. 195). To construct professional practice upon such pillars, Cooper (2012) offers a dynamic ethical decision-making process whereby public administrators gather and analyze facts given their roles, responsibilities, and ethical principles. In addition, this process sensitizes public administrators to the indicators of ethical dilemmas and challenges them as well to design scenarios, project probable consequences, and defend their decisions. Jacobs (2013) adds that Cooper's process also prepares public administrators to build more ethical organizations and communities, what Raile (2013) recently called "building ethical capital" in public organizations. Rooney and McKenna (2008) suggest developing a "sociology of wise practice" – an aesthetics-based approach to developing organizational wisdom – that would enable public administrators to create the conditions for wise practice within themselves as they understand the social relational structures and processes that build and sustain practical wisdom in organizations.

Positive ethical climate has also figured prominently. A number of scholars suggest, for example, that ethical leaders apply a social learning perspective to exert a positive influence upon the ethical climate of their organizations (Berman et al. 1994; Brown et al. 2005; Cooper and Wright 1992; Moore and Sparrow 1990). Public administrators provide this leadership by incorporating ethical concern into personnel systems (from selection through training to evaluation), adopting an ethics code, and requiring compliance with pertinent laws (Brumback 1991; Menzel and Carson 1999). As role models, they also make ethical decisions, conduct themselves ethically, set standards for appropriate conduct, and provide

formal ethics training (Beeri et al. 2012; Cohen 1993; Frisque and Kolb 2008; Treviño 1990; Treviño et al. 2008; Valentine and Fleischman 2004; West and Berman 2004). Additionally, they collaborate by forming "covenantal relationships" with followers (Barnett and Schubert 2002).

Summarizing this literature, Heres and Lasthuizen note that ethical leaders are moral, build positive leader-follower relationships, and manage morally. What they minimally achieve is to minimize conduct that is detrimental to the leader, group, or organization. More maximally, their efforts improve their followers' overall performance (2013, pp. 51–70).

Continuing education programs aimed at improving the organization's ethical climate appear to be important and, in particular, programs emphasizing values, adhering to legal standards, and avoiding wrongdoing as well as practicing value-centered, decision-making processes (including scenarios, role-plays, and group activities that provide in-depth information about cases and simulate the workplace). Critical in this regard is directing participants to focus upon concrete ethical practices not abstractions (Stewart and Sprinthall 1993). Workshops stressing greater accountability and trustworthiness also appear to improve ethical climate. Moreover, workshops providing opportunities for participants to interact with ethics officials increase their positive feelings about the knowledge gained as well as increase the participants' willingness to seek advice from those officials (Raile 2013, p. 259).

While ethical leadership is said to correlate with a more positive ethical climate (Berman et al. 1998), Menzel (1995) is cautious, as a positive ethical climate may actually lessen managers' perceptions of wrongdoing in their organizations. Menzel (1996a) also found a mismatch between individual beliefs and perceptions concerning prevailing ethical norms – generating "ethical stress" – that can decrease job satisfaction as well as increase perceptions that employee turnover is a problem.

Scholars have also considered the opposite scenario: Leaders who beget negative perceptions of ethical climate. While ethics regulations and laws contribute to a positive ethical climate, they require compliance, thus encouraging lower ethicality, not the kind of commitment that builds a positive ethical climate (Menzel 1999). Moreover, although public employees may view the implementation of codes of ethics as effective (Bowman and Knox 2008), doing so has produced mixed results (Ashkanasy et al. 2000; James 2000). Additionally, emphasizing ethical rules "can be viewed as condescension or hypocrisy, particularly if employees believe that supervisors act unethically" (Raile 2013, p. 255). Not only that, while codes specify what members of an organization should aspire to, the existence of those codes provides no guarantee that followers will embody the content of those codes in their conduct (Brown 2007). Furthermore, investing in systems of ethics regulations emphasizing various dimensions of good governance are oftentimes met with resistance, as followers may envision structural change as a mechanism for increasing managerial control which, in turn, generates resistance (Cowell et al. 2014). Commensurate with Maclagan's (1998) discussion, Baserman and Tenbrunsel (2011) identified how compliance initiatives can promote unethical conduct. Lastly, organizational politics can negatively influence perceptions of an organization's ethical climate (Vashdi et al. 2012). To correct negative perceptions, Brey (2000) has suggested that leaders subject the tools and practices of ethics rules and regulations to critical analysis using three values: democracy, freedom, and privacy.

Summarizing this body of literature, Heres and Lasthuizen observe that "[e]thical leadership is, to an important extent, in the eye of the beholder." Ethical leaders deliberately build a more positive ethical climate in their organizations and, due to this, have "a reputation for being ethically competent" (2013, pp. 52–53). It might be added, and vice-versa.

## Teaching Ethics

Only relatively recently has ethics education has been added to graduate public administration programs. Similar to the tide ebbing and flowing with respect to scholarly interest in ethics and public

administration, interest in teaching ethics has grown since the 1960s for a number of reasons, most oftentimes spurred by scandal, the desire for greater social equity, and demands by professional associations and organization to include ethics in the curriculum (Plant 2013).

Empirical studies have identified effective approaches to teaching ethics (Bruce 1998; Menzel 1997). Even though these studies cut across disciplines, similar pedagogical goals are evident. These include: ethical awareness and sensitivity; ethical reasoning; knowledge of ethical thought; and, practice/experience that often involves immersion in cases that approximate reality (Cooper and Menzel 2013, p. 91). Focusing upon traditional classrooms, Shareef (2008) offers a "values/public failure decision-making model" for ethics educators to introduce to graduate students. Jacobs (2013) offers an "integrated pedagogical model" for intentionally cultivating a classroom culture wherein students learn to appreciate the normative foundations of ethical thought that will prove relevant for public administration practice (pp. 95–130). Svara's (2015) "ethics primer" introduces the fundamentals of administrative responsibility and ethics, linking these ideas to the nature of the administrative process and the work of professional administrators.

Recent discourse concerning "ethical competence" (Cooper and Menzel 2013) implies the existence of a body of knowledge, skills, attitudes, and abilities – ethical "competencies" (Bowman et al. 2004a, b; Reamer 2013; Svara 2009) – specifying the content of ethical leadership. Of this content, Jurkiewicz states "Ethical competence can be defined, taught, and measured" and draws upon Kohlberg's stages of moral development to identify five factors of ethical competence for ethics educators to inculcate in students (2013, pp. 131–153). Assuming that Jurkiewicz is correct, traditional public administration training programs or continuing education programs, like the workshops mentioned above, provide venues where this content can be taught, practiced, and inculcated.

Concerning textbooks, Bowman et al. reported in 2001 that "the sheer quantity of ethics discussion can only be described as modest." Furthermore, excellence in ethics and technical ability are "curiously unrelated in this literature." In addition, the "set of personal, professional, organizational, and societal values and the conflicting demands that inevitably arise among them" is not delineated, making it difficult grasp the larger environment of ethical concerns for public administrators. Lastly, "the rich diversity of conceptual schema, provocative commentaries, controversial case studies, and empirical data (as noted) seems underrepresented." More significantly, the texts "do not directly explain the 'e' word." And lastly, "[i]f ethics is action (a common implication of ethics definitions), then a discussion in greater depth than typically provided is needed" (2001, p. 201).

Subsequently, textbooks have been authored that integrate ethical theory with practice for students to learn and apply the knowledge, skills, abilities, and attitudes associated with ethical leadership (Cooper 2012; Geuras and Garofalo 2010; Jordan and Gray 2011; Martinez 2009; Menzel 2012; Svara 2015).

Where ethics education exists, Heres and Lasthuizen (2013) ask: Do public administration ethics educators develop those values and competencies in students so they embody it in their professional practice?

O'Fallon and Butterfield's (2005) review of research published between 1996 and 2003 revealed positive correlations between moral development/ethical judgment and ethical intentions/conduct. Three studies noted positive correlations on measures of moral judgment and behavioral outcomes (Blasi 1980; Thoma 1994; Thoma et al. 1986). Integrity test measures administered after ethics education validly predict overall job performance (Schmidt and Hunter 1998). Empirical evidence also indicates positive correlations between ethics and performance (Berman et al. 1994; Bruce 1998; Burke and Black 1990; Menzel 1992, 1993, 1995, 1996a, b, 1997). Concerning the standard of assessment used to determine whether ethics education positively impacts workplaces, it has been argued that success evidences itself as public administrators indirectly improve perceptions of ethical climate in their organizations (LeClair and Ferrell 2000; Valentine and Fleischman 2004).

In contrast, traditional ethics programs do not appear to impact ethical decision making in the workplace because, as people confront ethical dilemmas, the basic psychology of decision making generates blind spots – ethical fading, for example – eradicating ethical considerations from the decision-making process (Bazerman and Tenbrunsel 2011). Then, too, as ethical standards shift, people neglect to notice and act on the unethical behavior of others. Jacobs (2015) has argued that ethics education as it is described in much of the literature falls short because the decision-making processes taught are rooted in science and/or art but do not develop insight in students. Brady (2003) points to the moral complexity of a public administrator's daily life as limiting the potential for ethics education to impact workplaces positively. Moral complexity derives for the most part "from the contest between ethical universals and particulars as having claims on the public servant's professional life." Responding to this contest, public administrators apply those universals to the particulars. As a result, public policy oftentimes is not implemented as analysts wish, but is "hammered out in compromises among the clash of special interests, as though the special interests are what prevent truly ethical public policy from being adopted" (p. 532).

Of the 460 articles published between 2004 and 2015 in the *Journal of Public Affairs Education* – which seeks to advance teaching and learning as well as the enterprise of public affairs education through focused, high-quality research – ethics did not rank among the top five topics covered (Network of Schools of Public Policy and Affairs 2016). Similarly, of the 201 articles published by the *Journal of Public Affairs Education* between 2009 and 2015, only two discussed teaching ethics and one treated of ethics in passing.

## Standards Associated with Professional Ethics

Professional associations have figured prominently in accrediting programs as well as the training and credentialing public administrators. These associations also assist in socializing public administrators to conduct themselves ethically (Pandey and Stazyk 2008). They do so by promoting ethical values (Eikenberry 2009; Rainey and Ryu 2004).

In 2001, Bowman et al. observed that no formal standards identifying the scope and content of ethics in public administration exist (p. 195). Eight years later, the Network of Schools of Public Policy, Affairs, and Administration adopted accreditation standards requiring programs – the mission, governance, and curriculum – to "demonstrably emphasize public service values." Defining those values as "important and enduring beliefs, ideals and principles shared by members of a community about what is good and desirable and what is not," NASPAA also specifies their contents – "competencies" – but allows programs to "identify the boundaries of the public service values it emphasizes, be they procedural or substantive, as the basis for distinguishing itself from other professional degree programs." However, NASPAA does not require that an ethics course be included in the curriculum or of students (2014, p. 2).

The International City/County Management Association (ICMA) promulgated its Code of Ethics in 1924, revising it in 2015. In 1972, the ICMA Executive Board adopted "Guidelines," also revised in 2015 (ICMA n.d.). The Code's 12 tenets represent aspirational principles intended to guide ICMA members' deliberative process, while the guidelines identify conduct applying those principles. In 2014, ICMA adopted a set of revised rules of procedure for enforcement of its Code.

The American Society for Public Administration (ASPA) adopted its first Code of Ethics in 1984, revising it in 1994 and again in 2013 to include 8 principles and 37 practices (ASPA 2013). In 2015, ASPA adopted a procedure for reviewing complaints regarding ASPA members who are alleged to have conducted themselves in ways that do not reflect its Code (ASPA 2015). Plant (2000) and Svara (2014) both have pointed to ASPA's role in promoting ethical standards.

Plant believes the significance of professional codes of ethics is how "they can lift individual public servants above the 'do's and don't's' of

ordinary organizational life to give meaning and reality to the highest values of a democratic society" (2000, p. 328). As a survey of ASPA members found, codes might promote the perception that this is the single most important activity a professional organization, like ASPA, performs (Bowman 1990, p. 352). While this statement may be accurate, the data are dated. For his part, Adams (2001) argues that "the association of ethics and professionalism is oxymoronic" (p. 291).

### Summary

Situating this body of literature in the historical context of public service ethics, Adams (1994) has argued that despite many advances, technical rationality has rendered professionalism in public administration morally vacuous, anti-democratic, and holding the profession of public administration in bondage to modernity. Further investigation is required to determine what this implies for practitioners who are imbued with a public service ideals, what a code of ethics implies for their organizations, and what all of this requires of ethics educators.

Scholars also do not agree about how public administration ethics should be conceptualized. With little empirical evidence demonstrating the positive impact of ethics upon the quality of service delivery (Stensöta 2010), more research is required not only to determine what that impact may or may not be, but also to provide ethics educators feedback about enhancements they may need to make to programs, courses, and workshops.

Furthermore, the language of the literature is changing. As the concept of *public service values* is supplanting that of *public ethics*, this "creates a quandary for public administration ethicists," Plant observes. He then asks: "Do the new standards narrow the definition of ethical competence, or do they require ethicists to provide the range of competencies related to public values?" (2013, p. 198). Further inquiry into the issue of language, its meaning, and what all of this implies for teaching public administration as well as its practice is also needed.

## Religion and Public Administration

Concerning the topic of religion and public administration, the literature is scant (Farmer 2005; King 2007), indicating that the moral values of the world's religious traditions have generally been excluded from the discourse (Lowery 2005). Of the literature that does include religion, most considers the contributions of religious traditions – primarily Judaism, Christianity, and Islam – and some has examined the contributions of more than one religious tradition (Shah et al. 2007).

Shah et al. divided this body of literature among three categories (2007, p. 5), placing into the first category authors who only indirectly address religion and public administration by referencing moral values that may or may not be influenced by religious considerations. The majority of this literature focuses upon Western nations, although some more recent literature focuses upon developing nations. Of the contents of this first category, Shah et al. conclude: "The mainstream public administration/management literature has not directly addressed the issue of religion in public management" (p. 5).

Into the second category are placed authors who address religion as part of a broader discussion concerning the influence and relevance of Western culture and context to public administration and public sector reform. Again, some works examine developing nations. Of the contents of this category, Shah et al. conclude: "In the context of developing countries, a number of works have acknowledged the importance of institutions and cultural context, although they do not address the cultural or religious specificities of countries" (p. 6).

Into the third category are placed authors who examined faith/religion and public administration from a comparative perspective (across religious traditions) as well as from the perspective of individual traditions. Shah et al. do not comment directly about these studies, few in number.

Widening their focus, Shah et al. present some "nearly relevant" studies discussing religion and politics (but not religion and public administration), cultural/social factors impacting public

administration reforms (usually not including religion), and religious models and experiences of public administration (often studied by adherents of a particular faith, Islamics in particular). Summarizing this body of literature, Shah et al. observe:

> . . .much is at the level of advocacy of an ideological perspective rather than critical academic writing. Much tends to defend a perspective and set of values that are taken to underlie public management rather than being based on empirical research. Authors often defend the faith base of forms of public administration or management that are little different from "western" forms. (p. 18)

### Substantive Definitions

While this division of the literature assists in situating its contents, the judgments concerning each division may be faulty, as they assume what Griel calls a "substantive definition" of religion (2009, p. 143) which differentiates between "wrongdoing" and "immorality" (or "evil") conduct. This conduct evidences itself on the part of public administrators, for example, as they engage in administrative evil (Adams and Balfour 2015).

One study examined the sex abuse scandal perpetrated by administrators of the U.S. Roman Catholic Church (Barth 2010). Inappropriate organizational culture, bureaucracy, technicism, and goal displacement blinded some administrators from adopting best practices based upon well-established administrative theory. The lessons for public administrators? When an administrative evil arises, what is "good" – a moral value – requires immediately sharing harsh truths with the public, accepting the stark realities of higher "public" expectations, establishing appropriate accountability systems, and fostering trust by building close community relationships. Describing these best practices, Lee (2002) invoked moral language calling public reporting in public administration a "duty" (or, moral obligation).

As substantive definitions of religion have influenced this literature, they typically translate the precepts and morals of the world's major religions into ideals. For example, deHaven-Smith (2003) discussed what Jesus would say to public administrators. Farmer (2005) would have public administration studied within the context of religion and, although numerous difficulties present themselves, offers 10 suggestions for inquiring into public administration in the context of religion (pp. 182–183).

In this way, substantive definitions of religion can assist public administrators in "making sense of the senseless" (Adams et al. 2006, p. 688). That said, these definitions are "exclusive," as other similar phenomena that are not substantively religious are not considered (Griel 2009, p. 143). Furthermore, they are normative in nature, resistant to objective testing, as they require belief in the premise to demonstrate their validity.

### Functional Definitions

"Functional definitions" of religion – rooted in experience and more inclusive in scope – consider "activities, ideologies, and structures that seem to share features in common with religion even though they are not always designated as such" (p. 143). Thus, although the literature is scant when using substantive definitions of religion, a number of articles in recent years have considered matters that are functional to religion, for example, mission (Goodsell 2006), spirituality (Anderson 2000; Fallot 1998; Giacalone and Jurkiewicz 2010; Houston and Cartwright 2007; King 2007; Willa and Novinson 1999), spiritual wisdom (Lynch and Lynch 1999), as well as moral values and precepts (Caiden 2007; Clerkin and Grønbjerg 2007; Farmer 2005; Garcia-Zamor 2003; Houston and Cartwright 2007; Houston et al. 2008; King 2007; Lowery 2005). For his part, Mosher directed attention to the moral value of professionalism (1982, p. 12), noting the significance of this value in shaping the conduct of public service professionals. Importantly, Mosher argues that professional elites and professional organizations – similar to a religion's hierarchy – as well as their institutions and faculties – similar to seminaries – determine what constitutes orthodoxy – morality – and heterodoxy – immorality – for public administration practice (p. 142).

For their part, Bertelli and Lynn identified a moral precept, "managerial responsibility," which subsumes the interrelated traditional public

administration values of judgment, accountability, balance, and rationality. This precept, they assert, "solves a major theoretical problem of American public administration by defining a role for administrative officers…" (2003, p. 259). Moral precepts like managerial responsibility, although not substantively religious, frame the decision-making process for public administrators in their role of moral agency in much the same way they do for adherents of the world's religions. Moreover, these precepts persist (Lynn 2001), similar to dogmas associated with religious myths.

Functional definitions also expand beyond precepts to include moral values that shape the ethos of public administration. For example, Bevir et al. (2003) discussed how traditional public administration is rooted in the Weberian bureaucratic model and manifests traditions, beliefs, and narratives emphasizing moral reforms to public administration and policy. To this end, public administrators must be personally committed to the public interest, bureaucratic organizational structure, and an ethos characterized by a system of moral values, including: efficiency, professionalism, duty, neutrality, impersonalism, fairness, and equity (du Gay 2000; Felts and Jos 2000). As Weber noted, the public administrator's duty and honor – a moral precept – is to carry out those procedures to demonstrate that "sense of duty stands above…personal preference" (quoted in Felts and Jos 2000, p. 4). Those moral values – what Gooden and McCreary (2001) call "that old time religion" – continue even today to influence public administration, albeit as the moral values of efficiency, benchmarking, and productivity.

By the mid-1960s and through the 1980s, Weber's model came under attack for not delivering on its promise. With Waldo's new public administration (NPM), a new moral system emerged (Batley and Larbi 2004, p. 39). NPM not only promised to make sense of but also to support a different ethos (Frederickson 1980; Salamon 2002). Moral reforms to public administration and policy would render both less "generic" and more "public," less "descriptive" and more "prescriptive," less "institution-oriented" and more "client-oriented," as well as less "neutral" and more "normative," but no less "scientific" (Nigro 2014, p. 320). To these ends, NPM accorded priority to management over policy, competition over monopoly, results oriented over procedures, and self-management over hierarchical control. NPM's primary moral values? Flexibility, responsiveness, and transparency (Bevir et al. 2003; Felts and Jos 2000). In NPM, virtue – what Macaulay and Lawton call "age-old moral concerns" – has been and continues to be integral to managerial competency (2006, p. 208).

Denhardt and Denhardt (2003) then unveiled the New Public Service (NPS), a set of ideals and related practices emphasizing democratic norms and citizen engagement in the conduct of public administration. Designed to give voice to the traditional and significant democratic perspectives that NPM was overshadowing with its rhetorical claims of improving government by running it like a business, NPS emphasized four moral values (the nature of public service, the role of administration in governance, and the value tensions arising from five competing challenges, namely, bureaucracy, efficiency, equity, responsiveness, and accountability). In NPS, the public administrator is a critical actor within a larger system of governance, assuring that the public interest predominates (p. 81). These values would evidence themselves as public administrators implement NPS to assist citizens articulate and meet their shared interests rather than functioning as the lone arbiter of the public interest by attempting to control or steer society.

Moreover, as public administrators integrate bureaucratic moral values (efficiency, expertise, efficacy, and loyalty) with democratic moral values (citizenship, democracy, and social equity), they will forge a professional ethos that would not be "purely objective but rather recognizes that judgments about values and how they should be balanced, advocated, and reconciled are necessary and should be guided both by personal values and the values and ethics of the profession as a whole" (Denhardt and Denhardt 2015, p. 670).

Unusual as this interpretation of this body of literature may appear, religious analogies possess the power to expand discourse concerning the public administration. Moreover, normative

moral values – Weberian public administration, NPM, and NPS, for example – have influenced the discourse concerning public administration during the twentieth century and first decades of the twenty-first century, suggesting that public administration has undergone a number of Reformations and Counter-Reformations.

### The "Vocation" of Public Administration

Stout's (2013) synthesis of the discourse concerning this topic indicates that the "literature's common reference to a professional ethos that guides role conception is captured in the notion of *vocation*, in the sense of calling." Defining vocations as "professions that are imbued with a particular ethos," Stout maintains, "this widely shared sense of the importance of vocation in public administration" provides the impetus "to operationalize vocation as public service motivation. . ." (p. 15). But, she adds: "Related literature about vocation or calling also explores the motivation to enter the public service, *assuming a role conception of moral purpose*" (p. 16, italics added).

During the 1960s, that sense of public morality envisioned the vocation to public service as characterized by the moral values of human relationships, cooperation, and collective action. These values coalesced into an ethos that gradually gave way to another ethos, one valuing market exchange principles and emphasizing professionalism (McSwite 2002).

Scholarly interest in "vocation" – described as "public service motivation" (PSM) – exemplifies this transformation, as PSM strips the vocation of its religious and moral connotations, replacing normative moral values with descriptive behaviors. The goal: For researchers to identify how PSM causes people to devote themselves to public service (Alonso and Lewis 2001).

Even so, moral values continued to influence discussion concerning PSM. For example, Perry and Wise (1990) defined PSM as "an individual's predisposition to respond to motives grounded primarily or uniquely in public institutions and organizations" (p. 368). But, discussing how three theoretical bases – rational, norm-based, and affective – motivate individuals, they note how those norm-based motives – the desire to serve the public interest (and no matter how this term is defined) – are particularly powerful. Using a functional definition of religion, these norm-based motives – patriotism, duty, and loyalty to the government – function as moral values to guide professional practice.

Several years later, Perry (1997) identified PSM's five antecedents, one of which is "religious socialization." Brewer et al. (2000) followed up by identifying four conceptions of PSM. Of particular salience are the Samaritans – suggestive of the "Good Samaritan" of the Christian scriptures (Luke 10: 25–37) – who are highly motivated to assist others. However, these individuals' motives are not wholly altruistic, balancing concern for the underprivileged with their own needs and interests (p. 259). Brewer (2003) as well as Houston and Cartwright (2007) also found that the attitudes of public administrators are more humanitarian and spiritual than other citizens.

Inquiring further into PSM's antecedents, Perry et al. (2008) found that religious activity – rooted in religion, spirituality, or a higher power – is one of the strongest PSM predictors of moral commitment. Although the sample included morally committed volunteers, for the most part it did not include public administrators. But, Perry et al. do raise the question regarding whether religious activity – especially when linked to self-perceptions of a need for personal integrity or wholeness in one's life as well as to personal understandings of the importance of community – is what attracts people to and to persist in public administration (pp. 454–454).

Evaluating the increase over the past decade of interest in PSM, Bozeman and Su believe the concept is "woefully underdeveloped as a dependent variable," addressing "universals" – normative moral values – that need to be subjected to more rigorous empirical testing. Developing a causal map for PSM, they argue, will be "a challenging task. . .because a great many factors likely interact (e.g., individual psychological makeup, organizational effects, systemic effects, peer interaction)" (2015, p. 7).

Recognizing the power this secularized ethos has exerted upon the topic of religion and public

administration in the decades following the 1960s, Staats (1988) described public service not only as "a concept, an attitude, a sense of duty" but also "yes, a sense of public morality." For their part, Denhardt and Denhardt asserted the need to "rediscover our desire to serve our fellow citizens and to think about our public service work in a way that celebrates its 'soul' and meaning" (2003, p. 173). Lastly, Frederickson (1996) pointed to the "spirit of public administration" and its moral values which are of fundamental importance to the quality not only of a democratic republic but also its administration.

Exploring the diversity of ways during the nineteenth and twentieth centuries that many of the characteristics of modern, secular government came to reflect the Church's organization, Raadschelders (2002) maintains this history is instructive as it identifies many of the good reasons for secularizing the state and subordinating organized religion to individual conscience. However, what about a state that is immune to critique by the wisdom of religion? Might it not exhibit some of the same excesses the Church exhibited when it dominated the State (for example, intolerance and persecution of dissenting voices, cronyism and nepotism, using office for personal gain)? More importantly, this history is instructive concerning present-day decisions that public administrators must navigate when the Church-State relationship is contested by various factions, for example, when the accommodation of religious interests and government support of religious practices, symbols, and services is called into question (pp. 275–295).

Freeman and Houston (2010) assert that if religion is to be re-introduced into the discourse, a more convincing case must be made. Because public administrators appear to be more active in and committed to their religious communities than is the general public, there are five ways religion and public administration interact which can provide a foundation for that case (p. 698).

In contrast, empiricists oppose any introduction of religion into public administration. So do atheists, like Richard Dawkins, and antitheists, like Christopher Hitchens.

Dawkins (1998a) asserts the superiority of atheism which, he asserts, evidences a critical and independent mind, one that derives conclusions based solely upon evidence (pp. 1–2). In contrast, he argues, religion has been and continues to be a source of conflict and, more importantly, is used to justify belief absent evidence (1998b, pp. 3–4). Faith – defined as belief not based upon evidence – represents "one of the world's great evils" because he views it to be a delusion (2006). Similarly with science which, Dawkins (1997) believes, is only superior to religion in that its zealots and bigots do not kill those who disagree with them. Like religion, is science problematic?

Similar to Dawkins, Hitchens (2007) asserts that belief in a God or a Supreme Being – especially of the Abrahamic religions – subjects people to a totalitarian regime. Unlike Dawkins, Hitchens is more optimistic concerning science, stating that the "pursuit of unfettered scientific inquiry, and the availability of new findings to masses of people by electronic means, will revolutionise our concepts of research and development." This will only happen, Hitchens maintains, ". . .on the sole condition that we banish all religions from the discourse. And all this and more is, for the first time in our history, within the reach if not the grasp of everyone" (p. 283).

From a constitutional perspective, Bisesi and Lidman (2009) believe the involvement of faith-based organizations in public administration during the first decade of the twenty-first century – although motived by compassion, a desire for political power, or some other purpose – "has considerable potential for controversy and, under certain circumstances, can have an adverse impact on a pluralistic democracy" (p. 4). In addition, even though faith-based organizations are relatively small in number, they might cause an imbalance between Church and State (Smith and Sosin 2001, pp. 665–666).

## Summary

During the twentieth century, much of the literature concerning the topic of religion and public administration indicates that moral values were

stripped of their religious denotations. As Wilson's (1887) "science of administration" and its progeny endeavored to validate secular versions of religious moral values, a new ethos purged most of the language of religion from public administration (Houston et al. 2008, p. 429).

As this discussion indicates, functional definitions of religion make it possible to examine the literature from a wider, more inclusive perspective indicating that religion figured a bit more prominently in the discoures, albeit implicitly. However, those functional definitions may be problematic. As Griel observes, they "may have the effect of so broadening the concept of religion that it becomes meaningless" (2009, p. 143).

In light of opposition on the part of empiricists, atheists, and antitheists, perhaps the topic of religion and public administration remains what Fruchter (2014) recently called "the unexpected elephant in the room." Addressing that issue would be helpful, that is, if scholars are to liberate public administration from the technical rationality that Adams (1994) believes has rendered professionalism in public administration morally vacuous, anti-democratic, and holding the profession of public administration in bondage to modernity. The point is: Reason and faith – science and religion – do not have to stand in opposition in an intellectual war for supremacy in the pursuit of truth. Each can offer the other helpful guidance and critique purifying knowledge in that pursuit (Benedict 2006; John Paul 1998).

## Conclusion

This survey of the literature illuminates three critical issues. The first two are highly contentious; the third calls for conceptual clarity and greater consistency in the discourse.

Arguably, the most critical issue – and likely the most contentious – is what may be the systemic exclusion of religion (to a great extent) and philosophy (to a lesser extent) from the discourse. A number of reasons implied in this literature provide an explanation: the post-Enlightenment demarcation separating the dictates of reason from the normative claims of theology and philosophy; the rise of empiricism, scientism, and technical rationality; and, the evermore "strict wall of separation" demarcating Church from State.

While this exclusion of religion and philosophy has not impeded the knowledge base of public administration theory and practice from expanding, it has immunized the knowledge base from robust theological and philosophical critique. In turn, this immunization may have served to retard public administration from developing even more fully as an area of scholarly inquiry. Might it be time for scholars to liberate themselves from the ideological shackles constraining their inquiry, in much the same way their Enlightenment forebears successfully liberated themselves from the ideological shackles constraining their inquiry?

Paradigmatic of a more robust approach is Weber's (1968) examination of the 1,300-year-old Chinese mandarin tradition of public administration exemplified in those scholar-officials across thirteen centuries who, in addition to performing their duties as public administrators, studied poetry, literature, and Confucian thought. Of particular importance for the present discussion is the latter, as this tradition integrated philosophy, religion, and public administration. For example, those scholar-officials functioned as tax collectors, police officials, judges, and public works supervisors. In addition, and similar to how religious leaders function in general, these local scholar-officials were viewed as paragons of virtue and morality. They taught in schools, preached Confucian ethics and morality, and even conducted Confucian ceremonies. That is, until Mao's cultural revolution.

This more robust approach also figured prominently Tyack and Hansot's (1986) analysis of the emergence of public schools in Massachusetts and beyond during the early- to mid- 1800s. Noting how most school principals and district superintendents were Protestant ministers, they viewed their mission as one of infusing a pan-Protestant ideology into the public schools for the purpose of

"Americanizing" the children of immigrants. For the purposes of this discussion, a religious "vocation" motivated these public administrators, offering insight into the religious dimensions of public service motivation that oftentimes – but not always – have been excluded from scholarly discourse. As the research indicates, religion and moral values are influential in the lives of many public administrators and, as the literature associated with public service motivation indicates, that influence should not be neglected.

Also not to be neglected is Barnard's "moral factor" of leadership. In *The Functions of the Executive*, Barnard (1968) peppered his discussion of administration with religious connotations, assigning significance to moral purpose, purposive action, faith, and morale as fundamental to what Weber – quoting Martin Luther – called (1992) "one's duty in a calling" and its work as a "vocation." Barnard's administrators challenge subordinates to identify how their individual moral codes provide more "valuable" means so their organizations will not just survive but also thrive. Furthermore, as subordinates give expression to their diverse moral codes and offer various means to achieve shared goals, administrators enhance the decision-making process as a qualitative, value-driven, moral endeavor.

Barnard also introduced philosophy into his discussion, specifically the theory of subsidiarity. Reminding administrators to be wary of hubris because they are neither the organization nor its primary decision makers, Barnard highlighted the essential nature of administration as devolving authority and responsibility to subordinates for the purpose of begetting greater cooperation and, hence, organizational effectiveness. Similar to von Bertalanffy (1969) – who described the ontology, epistemology, and axiology of systems – as well as Parsons (1967) and Luhmann (2013a) – who also discussed a systems theory of religion (2013b) – Barnard argued that "effective cooperation. . .means that the ability of the group exceeds the ability of an individual" (p. 27). Engendering this spirit of cooperation requires administrators who provide the "moral factor" of administration that enables subordinates to collaborate in the meaningful work of constructing something more valuable and enduring than any one of them, namely, an organization that fulfills its substantive purpose.

A second contentious but less critical issue is the U.S. Supreme Court's restrictive interpretation of the establishment clause in *Everson v. Board of Education* (Hamburger 2004). In the ensuing decades, that wall grew increasingly "strict" in the sense that Church and State were not to become entangled even though the Supreme Court has noted that "sanitized separation. . .has never been thought either possible or desirable" (*Committee for Public Education and Religious Liberty v. Nyquist*, 413 U.S. 756, 760 (1973)). Mirroring the culture, that wall has grown increasingly strict in public administration theory and practice (Bruce 2000).

Does this decades-old tradition require scholars to refrain from studying the topic of religion and public administration to determine what role, in any, the former may have in informing the latter?

The third issue concerns imprecise language.

Any reviewer of this body of literature will find the terms "ethics" and "religion," "principles" and "morals," "virtues" and "values," as well as "public administration" and "public service" used interchangeably. The title of Bowman and Menzel's 1998 book, *Teaching Ethics and Values in Public Administration Programs*, as well as Chapman's statement, "*Ethics* in government refers to *moral standards* in the *public service*" (1993, p. 1, italics added) exemplify this tendency.

Recognizing this problem, Kernaghan (2003) classified public service values into five categories. While this classification is helpful for identifying different types of public service values, the category "ethical values" would be more properly categorized as "ethical virtues" in that Kernaghan identifies traits of character evidenced in habitual conduct (Aristotle 1958).

Ethics is a branch of philosophy and religion is a branch of theology. Each possesses its distinctive language system. Clarifying concepts would demarcate the ethical (philosophy) from the religious (theology) and administration (science) from service (religion), making the discourse more uniform across the body of public

administration literature that discusses the topic of ethics and religion. This clarification would also make it possible to consider how public administrators are ethical agents who can be ethical exemplars as well as moral agents who can be moral exemplars (Garofalo and Geuras 2006). Moreover, clarifying these concepts provides a framework to identify the challenges public administrators confront when ethics and morality conflict, opening the door to consider and evaluate ethical and moral lapses and failures in public administration practice (Van Wart 2007). Lastly, clarifying these concepts fosters discussion concerning how both ethics and religion might inform public administration.

Addressing these three matters would certainly keep scholars who are interested in the topic of ethics and religion in public administration very busy. However, doing so would also contribute to more robust discourse having the effect of broadening inquiry into public administration and its practice.

## Ethics and Social Policy

Anthony Bibus III[1] and Mary S. Carlsen[2]
[1]Social Work Department, Augsburg College, Minneapolis, MN, USA
[2]St. Olaf College, Northfield, MN, USA

### Synonyms

Applied Ethics; Citizenship; Codes of Ethics; Duties; Ethical Decision Making; Frameworks for Analysis; Moral Philosophy; Morality; Policy Practice; Principles; Professional Ethics; Public Administration; Public Interests; Responsibilities; Rights; Standards; Values; Virtues

### Definition

Administrative ethics: "…well-based standards of right and wrong that prescribe what public administrators ought to do in terms of duty to public service, principles, virtues, and benefits to society" (Svara 2015, p. 195).

Advocacy: Work to influence social policies on behalf of individuals, families, groups, community, or general public.

Anti-oppressive: Focused on counteracting or resisting forces that limit freedom, equity, and well-being of certain groups.

Agency: The organization for which the public administrator works.

Autonomy: "The freedom to choose and act morally" (Garofalo and Geuras 1999, p. 149).

Beneficence: A virtue or value demonstrated by taking action that benefits others without necessarily being primarily motivated by caring for them.

Benevolence: A virtue or value demonstrated by acting "in a manner that promotes good and avoids harm for citizens" (Molina and McKeown 2012, p. 380); connotes being primarily motivated by caring for others.

Child welfare: Financial assistance or social services for children in need and their families.

Clinical: Related to professional practice helping individuals, families, or groups directly, especially addressing mental health difficulties.

Citizens: "…all residents who are members of the community that interact with government" (Svara 2015, p. 5).

Civic virtues: Duties and responsibilities that accompany the rights of citizenship and the habitual strengths of character that are required to carry them out.

Civil disobedience: Deliberately refusing to abide by a legal requirement that the public administrator believes is unjust.

Codes of ethics: Formal statements of moral principles and standards for what are considered proper aspirations and right or wrong conduct in the professional practice of public administration.

Competencies: The knowledge, skills, attitudes, and abilities needed to practice public administration.

Culture: The integrated, identifying pattern of knowledge, values, beliefs, communication, meanings, art, traditions, behaviors, etc., that distinguishes a societal group or community and

lives on from one generation to the next (NASW 2015, p. 12).
Deontological: Focused on considering absolute, universal, ideal moral rules, and principles, rather than consequences, in determining that acts are inherently right or wrong (for basic explanation, see Boss 2014).
Dilemma: A difficult forced choice, e.g., between two good or two bad alternatives.
Dispositions: Tendencies to act or think in certain ways; habits.
Documentation: Recording on paper or electronically facts, actions, decisions, dates, who did what when, and to what end result.
Documents: Legal papers authorizing individuals to reside or travel in a country, e.g., one's passport, passbook, visa, citizenship certificate, license, identification, etc.
Duties: A public administrator's obligations or responsibilities in a real situation having to act in accordance with certain ethical principles.
Environmental: Involving the interconnected physical context that surrounds all life, e.g., air, water, soil, space, climate, buildings, populations, etc.
Ethical competence: ". . .the cluster of knowledge, skills, and attitudes and abilities as an underlying characteristic of employees that is causally related to ethical performance in a job" (De Schrijver and Maesschalck 2013, p. 36).
Ethics: A set of norms drawn from values and used to address moral questions.
Ethics audit: Systematic, comprehensive, or formal appraisal of an agency's or organization's operations intending to show where there is adequate compliance with standards of right and wrong and where there may be missing or problematic areas or procedures needing development or correction.
Ethics forum: A gathering of members of a community (e.g., neighbors or employees) to discuss issues of right and wrong in public administration.
Ethics committee: An official advisory group (such as in an agency or hospital) charged with providing guidance to the public administrator and staff regarding issues of right and wrong and behaviors of staff reported to have violated standards.
Ethics of care: Focused on the value of relationships and connections between people.
Empowerment: Taking advantage of opportunities, both as a process and as an outcome.
Feminist: Focused on gender and on human rights and oppression resulting from patriarchy.
Governance: "The exercise of public authority" (Denhardt and Denhardt 2011, p. 86).
Grant: Money given for a specified purpose and use over a period of time.
Human dignity: Every person's right to be considered worthy of recognition, respect, and having needs met.
Integrity: Virtue or strength of character manifesting a stable and trustworthy moral center.
Interests: An individual's or group's goals, needs, or rights, what would be good for them, usually but not always from their own point of view.
Justice: Virtue or state of being that is right: e.g., all people are treated equally, needs met, and given equal opportunity.
*Law* (*legal*): Statutes, regulations, or court rulings.
License: Professional credential or certificate legally authorizing practice.
Macro: The largest, widest, most complex, and inclusive level of systems.
Maleficence: Doing a wrong or harmful act.
Malfeasance: Taking an action that is forbidden by law or ethical standards.
Mezzo: Middle or group level of systems between macro- and microlevels, larger than micro but smaller than macro.
Micro: Smallest, most local, immediate, individual, or simple level of systems.
Motivation: Will, desire, goal, purpose, or intention.
Moral philosophy: Systematic thinking about right and wrong and about how to make ethical decisions, be a good person, and live a good, meaningful life.
Moral intuition: The individual's innate sense of right and wrong; conscience.
Nonfeasance: Failing to take actions required by laws, ethical standards, or duties.
Policy: A plan, principle, or course of action adopted or proposed by a government, party, business, or individual; can be public (governmental)

or private (corporate or voluntary); public policies are intended to guide society.
Policy process: The technical and political steps to formulate, legislate, implement, and evaluate a policy.
Policy practice: Prof. Bruce Jansson (2014) created this term for professional efforts to create and improve policies or advocate for or against policies.
Practical wisdom: Virtue of prudence – careful, disciplined, informed judgment of the best course of action given the reality of the situation, marshaling other pertinent virtues as appropriate.
Practice: "...an activity organized to achieve certain standards of excellence" (Svara 2015, p. 62, Footnote #4).
Principles: General statements about what it takes to carry out or sustain values.
Profession: Educated and trained group of expert, paid practitioners of a particular recognized discipline or occupation that is deemed valuable to society, with its own distinct identity, set of competencies, shared values, and ethical code.
Professional association: Incorporated group of practitioners who voluntarily organize in the interests of their work and their discipline.
Public administration: Plant (2013, pp. 189–190) provides a contemporary and cogent definition – "Public administration is a vast field of enterprise encompassing the work of government at all levels, nonprofit organizations, and, increasingly, a plethora of organizations and contractors doing the public's business through third-party administration of programs, public-private partnerships, and collaborative networks."
Public administrators: Appointed, not elected by popular vote, under direction of government officials or nonprofit boards.
Public interest: What is good for most people (general public) rather than a select few, in the long term as well as short range, balancing competing interests with as much information as possible (see Svara 2015, p. 56, and Denhardt and Denhardt 2011, pp. 67–82, who on p. 80 explain that "public interest is best thought of as a process of community dialogue and engagement").
Recuse: Withdraw oneself from performing a role that under normal circumstances would be a required duty and entail oversight, evaluation, or judgment.
Regime: National government or political administration currently in charge.
Rights: Powers or goods justly held by or owed to each person.
Sector: Subdivision or delineated part of a larger whole.
Social equity: "...the active commitment to fairness, justice, and equality in the formulation of public policy, distribution of public services, implementation of public policy, and management of all institutions serving the public directly or by contract" (Johnson and Svara 2011, p. 282).
Social insurance: Programs like social security intended to provide a guaranteed basic level of income and other benefits, such as health care, to all people or to people in a particular category, such as those who are of a certain age or who have a debilitating condition.
Social policy: A subcategory of public policy that usually refers to governmental plans and guidelines whose primary purpose or focus is meeting the needs of people in society. Examples include social security, social insurance, welfare, public assistance, education, health care, housing, and public safety. Also, "the formal and consistent ordering of human affairs" (Karger and Stoesz 2014, p. 4).
Social services: Aid or support for life in the community, provided by or facilitated by professional practitioners or administrative staff.
Standards: Fairly specific statements of what behavior, practice, or conduct is considered ethical, i.e., carrying out moral principles and values.
System: A whole made up of parts that interact for a shared goal; changes in any one part affect all the other parts.
Utilitarian: Focused on how useful actions are toward the end of benefiting human beings, thus judging whether acts are morally right or wrong based on their consequences (for basic explanation, see Boss 2014).
Universal: Applicable to all people no matter the situation.
Values: Beliefs about what is good or worthy.
Virtue: Dependable, stable, habitual strengths of character, developing over a lifetime – "Virtues

are traits of character that are not innate, but acquired through reflection and conduct" (Cooper and Wright 1992, p. 6).
Virtue ethics: Focused on determining right or wrong based on what a person of excellent character and highest motivation would do under similar circumstances.
Welfare: Aid or help (often basic, financial, tangible, or concrete) for people in need that improves their lives.
Welfare policy: "The decision of governmental, voluntary, or corporate institutions that are concerned with allocating goods, services and opportunities to enhance social functioning" (Karger and Stoesz 2014, p. 4).
Well-being: Condition of human needs being met.
Whistle-blowing: Reporting, usually to external sources, one's agency's failures to follow policies and laws or other misdeeds.

## Introduction

This chapter considers the intersection of social policy and ethics, examining ethical issues that arise as public administrators work daily with social policies. Its purpose is to guide administrative practice and further study at the micro and mezzo levels. Social policies are formal plans for meeting people's needs, and while ethical considerations provide the foundation for the formulation and legislation of policies, the public administrator is primarily the actor at the level of implementation. At the heart of social policies are values that reflect society's interests and priorities. For public administrators, serving public interests is central for ethical practice. Therefore, the chapter presents a framework for public administration practice and policy analysis that is shaped with public interests in mind and informed by moral philosophy. This problem-solving framework supports a systematic process for thinking through ethical dilemmas and making ethical decisions. The chapter offers two tools for public administrators to use in this process as demonstrated in analysis of a case example: Strom-Gottfried's six-question model (2015, pp. 38–83) and Svara's ethics triangle (Svara 2015, p. 82).

Opening the chapter, an overview of professional ethics, codes of ethics, and a rational process for analysis and decision-making highlights the fundamental role that values play in professional ethics and social policy. At each stage in social policy development from initial needs assessment, design, and formulation through implementation to evaluation, analysis, and improvements, public administrators can identify potential conflicts in values and interests, ethical challenges, and difficult dilemmas. The American Society for Public Administration's (ASPA) Code of Ethics suggests eight areas of policy practice, such as in the fourth ethical principle to "strengthen social equity" by promoting "...affirmative action and other initiatives to reduce unfairness, injustice, and inequality in society" (Svara 2015, Appendix 3, pp. 205–210; see the other appendices for more examples of standards and codes of ethics in public administration). Following analysis and discussion of the case example, the chapter briefly presents other ethical issues and dilemmas that public administrators may face related to each of the ethical principles in ASPA's code. Resources for further study are referenced throughout, and the chapter concludes with recommendations for building competencies in ethical administrative practice.

## Professional Ethics and Codes

In this chapter, the term *professional ethics* refers to a set of norms that are drawn from values shared by public administrators worldwide and that can be used to address moral questions, issues, or problems, such as whether a particular administrative action, an individual administrator's conduct, or a selected social policy is right or wrong. In general, professional ethics are well established but have also evolved and vary in some details across time, settings, disciplines, and cultural traditions.

Application of ethics in relation to work with social policies has also evolved. In the first half of the twentieth century in the USA, public administrators mainly focused on implementing policies while leaving the development and authorization

of policies up to elected political officials or superiors. There was a "distinction between politics (or policy) and administration. . .." (Denhardt and Denhardt 2011, p. 6). More recently, however, professional ethics call for public administrators to be involved appropriately in all aspects of social policy from development through implementation and evaluation. For example, the American Society for Public Administration's Code of Ethics (ASPA 2013) stipulates that its members are committed to upholding the US Constitution and the law (Principle #2) and in their practice should "develop proposals for sound laws and policies and for improving or eliminating laws and policies that are unethical, counterproductive, or obsolete" (Practice #2.c, Svara 2015, p. 207). This provision seeks to guide administrators in finding a balance between respecting the authority and rule of elected officials and engaging in *policy practice* (Jansson 2014), i.e., efforts to create and improve policies or advocate for or against proposed new policies.

Because social policies reflect important values and priorities of society, they naturally give rise to ethical issues. They are plans and guidelines whose primary purpose or focus is meeting people's needs. Examples include policies governing social insurance, welfare, public assistance, education, health care, housing, public safety, and the environment. Social policy can also be described as "social action sanctioned by society," a formal and consistent ordering of human affairs (Karger and Stoesz 2014, p. 4, citing Epstein 2000, personal correspondence). Critically for ethics, social policies direct the distribution of resources, often scarce and limited. When analyzing and working with social policies, public administrators deal with the meaning of being human as well as with human rights. They make decisions about the role of society's collective responsibility and individuals' personal responsibility to meet needs. Hence, while primarily focusing on micro and mezzo levels of policy (e.g., affecting individuals, families, groups, neighborhoods, or communities), public administrators should be aware of ethical implications at the macro level (e.g., national policy strategies emphasizing governmental interventions instead of relying on private market forces or vice versa).

Professional ethics are expressed in formally adopted codes of ethics, i.e., published statements of principles and standards of practice that have been agreed upon by professional associations, such as the ASPA. They may also be incorporated into or referenced in licensing statutes, in which case the ethical standards apply not only to voluntary association members' practice but also to all licensees in the profession being regulated whether or not they are members of the professional association.

One of the more comprehensive examples of a professional code of ethics is the Code of Ethics of the National Association of Social Workers (NASW 2008). This code lists six core values, each of which undergirds a general ethical principle; the Code is subsequently organized into a set of 155 more specific standards for carrying out these values and principles in practice (Reamer 2013a, p. 57, 2013b, p. 171). Thus, the core value of "service" leads to the ethical principle stating that "social workers' primary goal is to help people in need and address social problems"; and then one of the standards for administrative practice is #3.07(a): "Social workers should advocate within and outside their agencies for adequate resources to meet clients' needs" (NASW 2008).

Members of each profession hold themselves accountable to the standards established by their professional associations; some professional standards are encoded as well in licensing statutes or other regulations so that there is public accountability and some protection for those using licensees' services. As Svara (2015, p. 101) asserts, "if used properly and if supported by reflection on the part of members, codes of ethics can alert professionals (and political superiors) to ethical aspects of their work, the limits of acceptable behavior, and the expectations of ethical leadership."

One limitation of codes of professional ethics is that in their need to apply widely across diverse and differing occupations and settings, they entail mostly general and abstract provisions. Statements of basic values, virtues, and aspirations such as promoting social equity are more common

than specific prescriptive expectations or prohibitions such as avoiding dishonesty, fraud, or deception. Moreover, some professional standards may focus more on serving the profession's interests than public interests. "Many codes are created by voluntary professional associations whose principal purpose is to promote the profession, along with serving the public" (Reamer 2013b, p. 169). Codes of ethics periodically also undergo revisions due to experience with ethical challenges or confusions, new discoveries and knowledge, changing societal roles, technological advances, or fresh insights. And although codes of ethics play an important role in holding public administrators accountable to ethical standards (especially if they are connected to procedures for reporting, enforcement, and discipline), consensus about whether an administrative action or social policy is ethical may be clearer in some situations than in others.

Furthermore, ethics are complex, and while principles and standards are interconnected, some may conflict with others in a given circumstance; judgments of whether an action or policy is ethical may not be forthcoming simply by referring to a code of ethics or licensing provision. Public administrators may face a difficult dilemma trying to balance one ethical principle or standard against another. One ethical standard can call for action that seems to contradict or curtail compliance with another. For example, most professional codes of ethics require both telling the truth and respecting confidentiality. In order for ASPA members to abide by Principle #7 *promote ethical organizations*, for instance, they may have to take action "to correct incidences of wrongdoing or report them to superiors" (Practice 7d, Svara 2015, pp. 208–209); in that process they have to override Practice #2d: "Respect and safeguard protected and confidential information" (Svara, p. 207). On the other hand, a public administrator who withholds information in order to protect privacy rights could be upholding a standard promoting human dignity while seeming to violate another standard requiring full disclosure and transparency.

A public administrator's personal values may also present tensions with professional ethics. A child welfare administrator who believes that hitting children is abusive, for example, may have an ethical duty professionally to implement policies that support parents' right to discipline their children as they see fit. Or, in another example, public administrators in family planning offices may find that their duty to enforce or implement a particular law or regulation sanctioning access to chemical birth control would require them to act in contradiction to their own religious belief that such forms of family planning are immoral. These examples raise the possibility that public administrators may consider engaging in acts of civil disobedience, which will be discussed later in this chapter.

Public administrators thus must make judgments regarding which ethical principles or standards take precedence over others using as their guide the spirit of their professional code's ethical statements. Svara reminds public administrators dealing with social policies that "it is not appropriate to pick out a single principle and use it to justify an action that may be questionable in light of other principles" (2015, p. 92). Recognizing this, ASPA's code (like others) states: "The Code and these practices are intended to be used as a whole and in conjunction with one another. An ethical public servant will consider the full range of standards and values that are relevant to handling a specific matter and be committed to upholding both the spirit and the letter of this code" (Svara 2015, p. 206).

## Ethical Decision-Making Process Using a Problem-Solving Framework

Given the dilemmas and tensions above, public administrators should use an ethical process in making their decisions and taking actions. Using a systematic, step-by-step process is more likely to result in ethical practice than acting impulsively. While the actual outcomes may not turn out as expected or hoped, a sound process, modified as necessary to fit the circumstances, can still be judged ethical and may also provide a defense against charges of ethical breaches.

A problem-solving framework for analysis of ethical issues and dilemmas in social policies can

guide this process (e.g., Barsky 2010, p. 246; Congress 1999; Plant 2013, p. 214; Reamer 2013a, p. 78; and Svara's model, 2015, p. 135); see also Wittmer's chapter on ethical decision-making (2001), Garofalo and Geuras' questions (1999, pp. 149–150), and Banks's discussion of decision-making models and "ethics work" (2012, pp. 203–205). Frameworks vary, but most have four basic steps: define the ethical issue, generate options, decide and act, and evaluate and document. The various stages of policy practice from design and proposal to implementation and improvement should also be considered throughout the process in so far as they are relevant to the ethical dilemma or issue:

1. *Define the ethical problem*: When facing a policy situation with potential ethical implications, the public administrator should first identify the values and issues involved and whether ethical dilemmas are present; i.e., are there tough decisions to make that may require acting in accordance with one ethical principle or standard over another or in favor of one set of interests over another? Formal analysis of the social policy should also begin at this point.
2. *Identify resources and generate options*: After describing the ethical problem as it is manifested in the social policy and possibly also in collaboration with others (superiors, consultants, colleagues, citizens), the public administrator should generate ideas for alternative actions, policy changes, or responses along with resources needed for each and expected intended and unintended effects for each.
3. *Decide and take action*: Now the public administrator is ready to decide and take action related to the ethical and social policy dilemma or issue.
4. *Evaluate outcomes*, *reflect on learning*, *and document results*: Finally, it is critical to evaluate results and reflect on what was learned both for accountability to public interests and for professional growth in ethical competence. Documenting actions taken, their rationale, and results along the way and upon final evaluation is vital.

## Strom-Gottfried's Model of Ethical Decision-Making

Many models for ethical decision-making have been published. Two are woven into the problem-solving process here as tools in decision-making. First is the model of six straightforward questions developed by ethics scholar Kim Strom-Gottfried (2015, pp. 38–83). These questions are useful in each of the stages of problem solving. They are not intended to be used in rank order of priority or in any order for action. In addition, Strom-Gottfried assumes practitioners will implement the decision and document it as appropriate to the setting, so those steps are not included. Here are the six questions (in quotation marks: see Strom-Gottfried 2015, Fig. 2.2 on p. 39):

### Who?

"Who will be helpful?" Even experienced professionals should not make decisions in a vacuum; it is crucial to consult with others. Those consulted should have knowledge about the setting or issues involved and confidentiality should be maintained. They may include colleagues, superiors or supervisors, ethics committees, academic or practicing ethicists, licensing boards, and attorneys. Such consultation can assist the public administrator in considering options for action.

### What?

"What are my choices" and how will they affect people involved? Here it is important to brainstorm all possible options for action, without regard to cost, feasibility, or even reason. Recognize that nonaction is a choice. Once these possibilities are generated, consider the consequences involved (harmful and helpful, short and long term) for everyone who is involved; this is a challenging step!

### When?

"When have I faced a similar dilemma?" This is a time to consider previous experience with similar situations – would I do the same now? How are the situations similar? How are they different? What have I learned already that might apply to the contemporary situation?

**Where?**
"Where do ethical and clinical guidelines lead me?" Values, principles (ethics), regulations, policies, statutes (law), practice knowledge, skills, and standards – all can influence in the decision. Here ethical theories or approaches from moral philosophy explicated later in this chapter may be applied using Svara's ethics triangle (2015).

**Why?**
"Why am I selecting a particular course of action?" Has it passed tests that help the public administrators critically examine their thinking and motives, such as how would their action be judged if it appeared on the front page of the local newspaper read by their mother? Sometimes personal beliefs, biases and preferences, and self-serving motivations can cloud thinking. Strom-Gottfried lists nine potential errors (p. 68), such as "Am I following the crowd?" "Am I acting in self-interest?"

**How?**
"How should I enact my decision?" As Strom-Gottfried observes, "a process that is poorly handled can turn a good decision into a poor one" (p. 71). Think carefully about the conversations, written memos or emails, online posts, speeches, etc. that will inform the parties of the decision.

## Svara's Ethics Triangle

Svara's ethics triangle provides a possible tool for analysis of ethical issues or dilemmas that applies three perspectives from moral philosophy (2015, Fig. 4-1, p. 82). (Other perspectives and theories from moral philosophy in addition to these three can also be relevant and helpful for public administration and social policy analysis, including ethics of care, feminist, anti-oppressive, and environmental theories.)

At the ethics triangle's peak is the deontological perspective that derives rules for moral behavior from universal, ideal, absolute principles such as justice, fairness, and equity. At one corner is the utilitarian perspective that calculates the moral goodness of actions based on their consequences: which actions have the best outcomes? At the third corner is the perspective of virtue ethics focusing on the character of the actor; tapping a constellation of virtues (habits and strengths of character such as courage, integrity, practical wisdom, compassion, humility, and openness to others), the public administrator may be more likely to make and carry out an ethical decision wholeheartedly. Svara also includes moral intuition, i.e., the public administrator's innate conscience, in this corner since it is a critical element of character. Although conclusions drawn from one perspective may conflict with those drawn from another, all three perspectives tend to complement each other or help balance the limitations of each. And at the center of the triangle, guiding the public administrator's judgment in the final analysis is the primary duty of public administrators to uphold the public interest. "The ethics triangle conveys the idea that administrators should act on their duty to promote the public interest by seeking a balance of virtue, principle, and good consequences" (Svara 2015, p. 82).

The following discussion of a hypothetical dilemma elaborates on how these perspectives help address ethical issues using the six-question model and ethics triangle in a four-step problem-solving decision-making process.

## Applying the Ethical Decision-Making Process to a Policy Example

Although this case scenario is hypothetical, it presents ethical dilemmas and issues that are typical for public administrators dealing with social policies:

You are a city administrator in a country where English is the dominant language. Your city has just been awarded a government grant to develop services for newcomers to the community who speak languages other than English. Funding for this grant is authorized in a national social policy that uses revenue from taxes. The policy's purpose is to support successful integration of migrants, refugees, or immigrants into the country. The grant requires

a portion of the funding be used to develop leaders from the group of newcomers so they can take part in community decision-making. Small honorariums may be paid to newcomers who agree to take part in leadership development training. As in many social policies, these benefits are reserved only for those who are in the country legally, but it is not clear how strictly this restriction is to be enforced or whether exceptions can be made; participants are not asked to show documents such as passports or visas proving they are in the country legally.

After the first two training meetings, about six months into the program, you find out that one of the most engaged community leaders with highest potential has entered your country without legal permission. What do you do? Do you pay her the honorarium? Do you allow her to continue in the program? Do you notify law enforcement regarding the newcomer's illegal status? Do you send her to an attorney or other advocate?

The following discussion and questions illustrates how to apply the problem-solving process described above in addressing the dilemmas presented in this case example:

### Define the Ethical Problem

A number of ethical issues arise in this case example. Ethical public administration centers on serving the public interest. The social policy in this example would certainly be in the general public's interest if it contributes to successful inclusion of newcomers into the city's life, especially if it does so by involving newcomers themselves along with other community members in implementing the policy. Yet, its provision allowing payment of honorariums only to those who have legal documents approving their residence in the country excludes the woman in the case example, which may be neither in her interests or the public's interests since it could jeopardize the livelihood and well-being of newcomers without documents. On the other hand, enforcing this exclusion provision could be in the public's interest by rewarding legal migration and bolstering public trust in the operations of the grant program. In addition, the reputation of the city manager's office as law abiding could be enhanced, increasing support for future similar programs and funding.

Hence, one difficult dilemma here is having to choose between respectfully treating the newcomer as a person with dignity who should be paid for her work and dutifully obeying the provisions in the policy that would prohibit paying her and might also require reporting her illegal status. Analyzing the policy itself will help flesh out the ethical issues and prepare the way for thinking them through. Karger and Stoesz's model for social policy analysis is one of several that can guide this process (2014, pp. 29–32) as follows:

Begin by recalling the *historical background of the policy*. Has it always been true that benefits can only be paid to people with legal permission to reside in the country? Is there interaction between local and global perspectives or interests? Have national policies always, or just sometimes, required proof of legal status to participate in programs? Perhaps in this case, your community has not been involved before in this policy nor received similar grants in the past. The community may be relatively homogeneous and unchanged in recent years, or it may have more experience with out-migration than in-migration. Alternatively, the community may have had a long record of welcoming and integrating successive waves of newcomers over the years from various parts of the globe, and city staff may have had a hand in developing similar grant programs.

Next, *identify the problems that necessitated the policy*; in this case perhaps an increasing number of newcomers who speak languages other than English have been arriving and need assistance integrating into neighborhoods, employment settings, and schools. Then, the public administrator should examine the social policy's details, explicating its purpose, goals, and objectives, noting its governmental auspices (e.g., who has oversight responsibility), locating any criteria for funding decisions (such as the exact wording and meaning of the provision regarding newcomers' legal status), and identifying operational and evaluative

mechanisms (e.g., what are key indicators of the policy's success).

Finally, *assess the values underlying the policy and its political and financial feasibility.* This will reveal sources of congruence or conflict with professional, personal, and community values. Karger and Stoesz suggest addressing several questions to assess the values at stake, among them:

*How are the people whom the policy intends to benefit viewed*? Perhaps they are seen as primarily economic immigrants with limited rights who should be employed only if they are legal residents and then only in positions in which current legal residents are not interested.

*Who are the major beneficiaries*? The policy as currently written benefits newcomers who are legal residents, for whom there will be more grant funding if newcomers without documents are not eligible.

*Is the policy designed to foster real social change or to placate a potentially insurgent group*? If many newcomers do get the training and become leaders, perhaps they would be less likely to cause public disturbances, rocking the political boat, even if undocumented people do not have the same opportunities. Conversely, they may advocate for changes in the policy to benefit others.

## Identify Resources and Generate Options

Strom-Gottfried's six-question model can be a useful tool for generating a range of possible responses and identifying resources needed for an ethical choice.

### Who Will Be Helpful?

It is important here to consider with whom to consult. Might other city administrators have faced a similar dilemma? How have they surveyed the views of the city's elected officials? How about contacting an immigration attorney? Because the local banker or accountant who manages the grant might not want or need to know that money will go to someone who is without papers, you could bypass consulting with local staff and instead confer with a financial expert in another city. Perhaps you want to talk with the director of an organization who works with undocumented people in the area. Trusted colleagues from your professional association, a mentor, other government officers, or elected political leaders who developed or are familiar with the national policy could all be resources for consultation. Scholars and researchers in the area of immigration as well as journal articles, reliable Internet sources, or books on the subject may also be available. Maintaining confidentiality as you consult is critical, and you should exercise discretion in choosing sources and revealing only the information necessary. Also, remember that this process of consultation is valuable at every stage of the process including getting feedback about the options you have generated and about the results of your final decision.

### What Are My Choices and How Will They Affect People Involved?

First, think about all your options for action or inaction, without consideration of their effects. You could:

- Ignore the fact that this person is undocumented and pay her in cash that cannot be traced.
- Seek an exception to the requirement for legal resident documentation in this case or find an alternative source for paying her the honorarium.
- Tell her that without documents she must end the training and cannot be a leader.
- Call the nation's immigration law enforcement agency (in the USA, the Immigration and Customs Enforcement (ICE) agency) and report her.
- Refer her to an immigration attorney in order to seek legal status.
- Send her a check for the honorarium and let her figure out what to do with it.
- Take more time before deciding.
- Begin the process of advocating for changes in the social policy that would clarify its provisions regarding residents' legal status or be more explicitly inclusive.

Other options or combinations of options may emerge in the process of addressing this dilemma, including gathering more information or consulting further. Now, for each option, consider who might be affected by your action, both in the short and long term. For instance, if you ignore the fact that the newcomer leader is undocumented and authorities find out later that you knew, the government could pull the grant money and end the program. This could affect your reputation, the city's opportunity to get another grant, and the other newcomers who now do not have the opportunity to engage with a program to integrate them into the community. You should always keep in mind the predictable effects of each choice on all involved, including the newcomers, city residents, and yourself, knowing you could be mistaken and few outcomes can be guaranteed. Strom-Gottfried also reminds practitioners to establish tentative timing of actions to be taken with each option and to compare their urgency. In this case, legal repercussions may dictate selecting one course of action over another.

### When Have I Faced a Similar Situation?

Have you faced something like this before, or is this the first time you have worked directly with the issue of undocumented people? Who was helpful last time? What have you learned from previous experiences? How is this situation different from past ones? Have policies or public opinion changed? Perhaps the city has procedures now in place for handling ethical dilemmas that you will need to follow. Jurkiewicz (2015) notes that municipal governments in Europe and Africa are currently active in implementing innovative governance structures, and yours may have focused on cultivating ethical administrative climates and increased transparency.

### Where Do Ethical and Clinical Guidelines Lead Me?

Svara's ethics triangle can help you consider which values, principles, regulations, policies, laws, practice knowledge, skills, and standards might affect this decision. First, ground yourself in the center of the triangle with your primary duty to the guiding principle of what is in the interests of the public at large, subordinating your personal or professional interests and those solely of other interest groups. Principle #4 in the International City/County Management Association (ICMA 2008) Code of Ethics reads: "Recognize that the chief function of local government at all times is to serve the best interests of all of the people" (Svara 2015, p. 213).

Then, at the top of the triangle, check out sources for statements of other universal principles, ideals, or moral imperatives that may also guide your decision. Key sources will be professional codes of ethics and regulatory statutes, including the social policy funding the program. Remember to include relevant international conventions, especially the United Nations *Universal Declaration of Human Rights* (1948), as well as the nation's constitution for provisions that embody ethical principles. In this case, many articles of the declaration highlight rights to be considered, such as the rights to equal protection without discrimination (Article 7), to access to public service (Article 21), and possibly to asylum from persecution (Article 14). In the ICMA Code of Ethics, Principle #9 reminds you "to seek to improve the quality and image of public service" (Svara 2015, p. 214), and Principle #10 calls for handling problems professionally, justly, and without discrimination (p. 215).

Even as these statements of principle may lead to rules requiring some actions or prohibiting others (such as "foster equity and "do not discriminate"), still they are abstract ideals, difficult to apply concretely in specific situations, and could lead to different and even contradictory decisions. For example, paying the honorarium could be seen as abiding by the ASPA standard to "advance the good of the public as a whole, taking into account current and long-term interests of the society" (#1a) by enhancing the integration of newcomers, but it could also be seen as jeopardizing the good of the public as a whole by encouraging illegality, violating the ASPA standard requiring public administrators to uphold the law (#2).

Another universal principle, beneficence – providing money to the woman in this case does good to her and treats her as an end in herself, a person with dignity and worth – could lead to a decision

to ignore this leader's immigration status. But this could cause harm to more people than it would help; that is, she might get the money, but then her status without papers might later be revealed, she could be deported, and the program could be cancelled, with many other newcomers not served and the city ineligible for further grants.

Potential consequences such as these can be weighed using a utilitarian approach. At that point in the ethics triangle, your focus is on outcomes for each party that could result from various options. You should consider potential current and future effects for the general public, the city or its administration, the newcomers generally and the woman without papers in particular, and yourself. Consequences, harms, or benefits for each are likely to vary. Versions of utilitarian thinking differ as to whether short-term or long-term effects are paramount and as to whether what is best for one or a few people would outweigh benefits for a majority. You may need to balance doing less harm to the public's interest against causing more harm to the individual woman in this case; that is, you may need to trade off one set of outcomes for another. It is also germane to question whether a good end result justifies the use of harmful methods or means to accomplish it. Finally, some utilitarian approaches focus on the predicted effects of specific acts, while others argue for considering the nature of the precedent or rule for the future that you are setting with your actions. In this case example, the act of ignoring legal status could inadvertently undermine the rule of law more generally.

As with general moral principles that might not give specific direction in this case, utilitarian calculations based on predicted outcomes often fail to provide enough clarity for ethical analysis and decision-making by themselves and can be used to support conflicting decisions. You are still faced with a tough decision. The last corner of the ethics triangle turns the focus on you, the decision-maker and actor.

Virtue ethics considers qualities of character associated with leading a meaningful moral life, i.e., the habits and strengths that one develops over a lifetime in relationship with others and with which one flourishes as a human being. In his concise summary of virtue ethics perspectives, their history, and their contemporary relevance in public administration, Cooper defines virtues as "traits of character that are not innate, but acquired through reflection and conduct" (Cooper and Wright 1992, p. 6) (For more on virtue ethics, see Annas 2006; Cooper 2001; Hursthouse 2012; MacIntyre 1985, 1999).

For the dilemma faced in this case example, tapping an appropriate combination of virtues such as courage, practical wisdom (prudence), integrity, fairness, compassion, and humility can help in analysis, decision-making, and ethical action. APSA's standards call for public administrators to demonstrate personal integrity in order to "inspire public confidence and trust" and "to exercise integrity, courage, compassion, benevolence, and optimism" (#6 a) – these five virtues are listed explicitly in both the 1994 and 2013 codes (Svara 2014, p. 565 – Table 1).

With its holistic approach, taking into account emotional intelligence as well as other habits of mind and the important role of relationships with others, the perspective of virtue ethics can consolidate your decision-making process. Certainly, having courage to act in accordance with your duty to serve the public will be required. This point on the ethics triangle provides an opportunity to reflect on your existing strengths of character and where you will need to build strengths to carry out your duty. The example of public administrators whom you consider virtuous and of those featured in the literature (e.g., Cooper and Wright 1992; Dobel 1999; Flescher 2003) can serve as models for you. Approaches from the perspective of virtue ethics are especially adept at elucidating motivations: what actions would a virtuous public administrator take in this situation and how do they compare to what you want to do (at your best)? Maybe you say to yourself that you are too honest to ignore the truth about the newcomer's legal status, so removing her from the program is the honest (virtuous) action to take. Indeed, virtues of integrity, judgment, and practical wisdom "form the bedrock of public morality" (Dobel 1999, p. xii; Banks 2010). Moreover, you may need to cultivate virtues such as cultural humility and openness to others as you evaluate

**Ethics and Social Policy, Table 1** ASPA principles

| Standard | Description | Social policy questions |
|---|---|---|
| 1. Advance the public interest | Promote the interests of the public and put service to the public above service to oneself | *Who is the public when social policies focus on special interests*? |
| 2. Uphold the Constitution and the law | Respect and support government constitutions and laws while seeking to improve laws and policies to promote the public good | *Can I engage in protest or civil disobedience*? *Can I ever refuse to implement social policies with which I disagree*? |
| 3. Promote democratic participation | Inform the public and encourage active engagement in governance. Be open, transparent and responsive, and respect and assist all persons in their dealings with public organizations | *How can I make government responsive and encourage engagement in developing or implementing social policies*? |
| 4. Strengthen social equity | Treat all persons with fairness, justice, and equality; and respect individual differences, rights, and freedoms. Promote affirmative action and other initiatives to reduce unfairness, injustice, and inequality in society | *How can I make personnel and budget decisions fairly and justly when implementing social policies*? |
| 5. Fully inform and advise | Provide accurate, honest, comprehensive, and timely information and advice to elected and appointed officials and governing board members and to staff members in your organization | *How can I assure staff that no surprises or changes in social policy are looming*? |
| 6. Demonstrate personal integrity | Adhere to the highest standards of conduct to inspire public confidence and trust in public service | *How can I behave responsibly to inspire trust in the government's social policies*? |
| 7. Promote ethical organizations | Strive to attain the highest standards of ethics, stewardship, and public service in organizations that serve the public | *How can I create and maintain a culture of ethics in policy practice*? |
| 8. Advance professional excellence | Strengthen personal capabilities to act competently and ethically and encourage the professional development of others | *How can I be a virtuous role model for others in designing, proposing, influencing, implementing, or evaluating social policies*? |

how you might be wrong, as will be discussed under the "Why Am I Selecting a Particular Course of Action?" question below (Fowers and Davidov 2005).

When you are ready to choose an option and take actions to carry it out (see "How Should I Enact My Decision?" below), you should be wholeheartedly committed to your decision as the best under these circumstances and then assess whether efforts and results in fact meet standards of excellence; if they fall short, as is human, there will be opportunities for learning and doing better. After all, public administrators should be willing to strive for self-awareness and be committed to continually building ethical competence (Plant 2013).

### Why Am I Selecting a Particular Course of Action?

This question provides a chance to reexamine your motives and rationale. Moving back to the center of the ethics triangle will help counteract the tendency of virtue ethics to drift into self-serving biases, such as the circular thinking entailed in judging an action as virtuous because a virtuous person is doing it. If your primary duty in light of all possible courses of action is to uphold the public interest, can you say your choice of action passes that test? Would other administrators agree with removing this woman from the program or with calling immigration authorities? Would you be comfortable with your mentor in the field of public administration reading about your decision in professional publications? Is your motivation clear and without undue bias, self-interest, conflicts of interest, or fear?

As noted above, the virtue of humility could be critical in examining your motivations and in coming across as a public administrator who authentically recognizes your strengths and limitations. As defined by Peterson and Seligman in

their 2004 comprehensive classification of character strengths and virtues, "…humility involves a nondefensive willingness to see the self accurately…." (p. 464). Its key features include "accurate (not underestimated)" self-assessment; acknowledgement of limits or mistakes; openness to criticism, advice, and new ideas; and a balanced perspective without obsessive focus on one's self (p. 462, citing Tangney 2000, 2002).

A humble public administrator will come across as both modest and assured, open and welcoming, and secure and confident, seeking partnership and information rather than approval or vindication. Like other virtues, humility may be recognized by contrasting it with opposites, in this case defensive reactions to threats, disrespect for the views of residents or others who oppose your views, or self-centered grandstanding. Thinking that one has special expertise or a unique vantage point so that the customary rules do not apply is a danger sign that warns of unethical waters ahead. Rather, public administrators exercise humility by steadily and firmly steering a middle course between extremes of arrogant self-aggrandizement (pride) and self-abasement.

In this case example, an application of humility with cultural competence is pertinent. Called "cultural humility" (NASW 2015), this virtue combines examining one's personal and professional culture (including strengths, vulnerabilities, and biases) with reaching out to others whose cultures may share commonalities but also may be different in important aspects (Fowers and Davidov 2005). Public administrators should be keenly aware of the power differences inherent in their positions compared to others and be ready to reach across those differences. As with all virtues, cultivating cultural humility is a lifelong work. A public administrator dealing with policies involving newcomers in the community expresses cultural humility first by reflecting on one's own culture and on the city's dominant culture (especially inherent prejudices or presumptions about other cultures), second by gaining understanding of newcomers' cultural backgrounds without jumping to conclusions about how strongly an individual newcomer might identify with a particular cultural group (this requires careful study and listening), and third by recognizing that mistakes are likely. You could be wrong. And you still will have a duty to decide and act.

### How Should I Enact My Decision?

Strom-Gottfried asserts that "process matters!" (p. 70) and reminds practitioners to consider ultimate objectives. You may decide to involve other city staff or employees or the newcomer leaders in carrying out the option you choose or you may delegate portions of the plan to others. How will you inform those affected by your decision? If you ignore the woman's legal status, would you let your bookkeeper know, in case the bank raises questions? Would you let your boss (the city council?) know of the issue? Remember to set up procedures for carefully documenting your plans, actions, and their impacts. Where would you keep notes on your decision and consultation process, in the event anyone raised questions later?

## Decide and Take Action

Garofalo and Geuras (1999) argue for integrating three perspectives featured in the ethics triangle (deontological, utilitarian, and virtue ethics) plus the perspective of moral intuition (i.e., the individual public administrator's faculty as a human being to discern right from wrong) so that they form a unified framework. They suggest four questions (pp. 149–150) that can serve to summarize and consolidate the analysis conducted here thus far.

First, *what are the key moral principles relevant for the social policy at issue in this case*? Principles of justice, fairness (especially due process), human dignity, benevolence, beneficence, equity, nondiscrimination, and keeping the public administrator's promise to uphold the law and the public interest are key. Another universal ideal, often considered a primary principle (e.g., in medicine), is non-maleficence: that is, first do no harm! While it seems that you have a duty to take some action in the public interest (rather than do nothing and risk harm to all involved when the newcomer's lack of legal resident status

comes to light), there are potential risks associated with each action that could be taken.

The public administrator should work to minimize those risks by addressing the second question Garofalo and Geuras recommend: *What are the likely consequences of actions taken to achieve the purpose of both the public administrator and the policy in this case*? Assuming your purpose is to support successful integration of newcomers into your city, you will want to take actions that abide by the intent of the policy as it conforms with human rights; that foster a broad welcome to newcomers in the community; that do not provoke an angry, hateful, or fearful backlash; and that create a climate for inclusion and participation of all residents, including the newcomers.

The *third and fourth questions* in Garofalo and Geuras' unifying framework turn the public administrator's focus inward: first to *review character traits or virtues* such as courage, compassion, integrity, and practical wisdom that will be needed and finally then to where one's gut feelings point (using *moral intuition*). Actions will need to be doable or successfully delegated. Acting with integrity would rule out any of the options that involve dishonesty or nontransparent strategies such as pretending not to know about the newcomer's lack of papers or hiding behind the policy's ambiguity. Practical wisdom could dictate taking more time to consult and check on the policy requirements and possible exceptions; the city attorney could be a critical resource. It would take courage and compassion to try to go beyond simply enforcing a legal residence rule dismissing the woman in question from the program. Dobel (1999) points out: "As situations grow complicated, difficult, and lengthy, virtues provide the stability of judgment and the emotional endurance to make it possible for individuals to pursue moral commitments over time and across obstacles" (p. 196).

Certainly getting more clarity with regard to the policy's requirements regarding citizenship status is essential. A sensible next step could be to meet with the woman in question and alert her to the issues that have arisen in the program regarding participants' official residence status, offering to secure legal advocacy for her as needed. If possible without violating confidentiality, involving the newcomers in addressing the dilemma could generate other solutions that you have not yet considered. Involving other citizens could also be fruitful. Denhardt and Denhardt (2011, p. 96) list nine reasons for involving citizens in the process of policy work including potentially improving the quality of the policy, helping to implement it, and increasing trust; they write that "citizen involvement that achieves extensive participation from persons affected by a decision promotes understanding of the issues involved, grounds the decision in citizen preferences, and builds support for the principle of citizen engagement" (pp. 172–173).

This could be an opportunity to teach the responsibilities as well as rights of citizenship and to model civic virtues. Mobilizing the newcomers and allies to influence improvements in this and other related social policies affecting the lives of newcomers, their potential contribution to society, and their integration into the community could be an effective strategy though there could also be political risks. You should gauge how much support you would have from superiors, elected officials, and others in the city administration; how much power and discretion you have; and where strongest opposition may arise. Finally, this example highlights how important it is to have a global perspective in developing social policy. Public administrators must not only be aware of the economic, political, environmental, and health pressures that affect the movement of people internationally and will have an impact on their local policies but also be ready to learn from the experience of public administrators worldwide.

When you are ready to take decisive action, you should have some confidence that it is right and that you are not taking a half-hearted course. As Denhardt and Denhardt (2011) write, you ". . .. must share power and lead with passion, commitment, and integrity in a manner that respects and empowers citizenship" (p. 155).

## Evaluate Outcomes, Reflect on Learning, and Document Results

This step is sometimes left-off frameworks for ethical decision-making, but it is the most

important for fostering the moral development of the public administrator as well as for substantiating that an ethical process has been followed. Accurate and clear documentation can be essential in managing responses to lawsuits, audits, or ethics complaints. Your records may also constitute evidence for what is working in the social policy and where improvements are needed. If the city does not have a procedure in place for addressing ethical issues and documenting the process and its outcomes, it is wise to create one and ensure that staff are aware of it and use it.

Other examples such as the above involving social policy decisions that raise ethical dilemmas or issues are virtually unlimited. The following examination of the ASPA Code of Ethics illuminates eight specific areas of particular concern to public administrators.

## Other Ethical Issues Related to Social Policy

The ASPA Code of Ethics includes eight principles that guide the policy practice and policy analysis performed by public administrators. Table 1 delineates these standards with illustrative questions followed in the text by examples of ethical issues common in public administration:

To *advance the public interest* is to work to always promote the interests of the public one serves. This also entails putting service to the public above service to oneself. It implies the broadest definition of the "public one serves." One might face a conflict of interest or need to recuse oneself because of a conflict presented in proposing a social policy. Perhaps you face a decision about spending funds to print government documents in two more languages spoken by local residents and to hire an interpreter part-time versus upgrading equipment and furniture in your office after years of deferred maintenance. Such dilemmas involving rationing and allocating limited or curtailed resources are common in implementing social policies and in navigating conflicting or special interests.

Public administrators are called to respect and *uphold the Constitution and the law* while seeking at the same time to improve laws and policies to promote the public good. These two tasks raise potentially conflicting duties that might bring the administrator to consider civil disobedience. A recent example is the government employee in the USA who refused to issue a marriage license to gay couples due to her personal religious opposition to gay marriage, which had just been judged a new legal right throughout the country. If you are her supervisor, do you support her right to refuse, or do you terminate her employment? This is an example of a conflict between duty to uphold the law and duty to respect autonomy. In this, as in most cases of civil disobedience, the burden is on the public administrator who refuses to implement the law to show how most ordinary, reasonable, prudent, and ethical public administrators would act with disobedience under similar circumstances.

To *promote democratic participation*, an administrator must assure the public that all have opportunity for active participation in governance and access to information about government. Residents need government that is open, transparent, and responsive, and governmental staff should respect and assist everyone in their dealings with public organizations. One example related to electoral policies (which help make social policies legitimate) is establishing a new polling location; e.g., should you locate a polling place on a college campus, where most students tend to vote as liberals, often lack knowledge about local issues, and vote primarily in years when there is a national presidential election? Locating a new polling place, you need to assure the public that you consider all facts and ramifications of its location.

The administrator who treats all persons with fairness, justice, and equality while respecting individual differences, rights, and freedoms is able to *strengthen social equity.* This can involve promoting affirmative action and other social policies to reduce unfairness, injustice, and inequality in society. However, dilemmas can still emerge. For instance, you are the mayor of a small town and have the power to appoint people to local boards and commissions. Many in the community have asked you to consider a person of color and a person under age 30 for the human rights or

community services commissions that carry out or advise on social policies. But two of the people in your book group who are not persons of color or under 30 have wanted for years to serve, and you know they would do a good job in advocating for meeting the needs of youth of color.

Public officials who provide accurate, honest, comprehensive, and timely information and advice to constituents of their offices follow the principle to *fully inform and advise*. This means that elected and appointed officials and governing board members, in addition to staff members in your organization, should not be surprised by policies you have knowledge about. For example, you become aware that in six months the law will be changed to make it legal for people to carry handguns in visible holsters. While you may not support this decision, you must let businesses and other organizations in your community know the expected implementation date so they can fully prepare.

Public administrators must *demonstrate personal integrity*. Virtue ethics calls on public administrators to adhere to the highest standards of conduct to inspire public confidence and trust in public service. In some countries and contexts, bribery and other corrupting influences may tempt public administrators. Codes of ethics for public officials in the USA regulate acceptance of gifts or other favors and prohibit conflicts of interest such as use of position or expertise to secure private gains, advantages, or employment (see, e.g., Minnesota Statute 43A.38 Code of Ethics for Employees in the Executive Branch.). Resisting pressures from superiors or others in administration to cut corners or subvert social policy goals requires some courage as well as practical wisdom (prudence). So too does protecting whistle-blowers from retaliation or blowing the whistle oneself if efforts to remedy the problem internally do not lead to ethical changes. Affirming that whistle-blowing can be "an ethical requirement," Svara (2015, p. 147) warns of the severe retaliatory techniques that organizations use to punish whistle-blowers. He also suggests constructive strategies for public administrators to consider in calling attention to administrative, organizational, or governmental misconduct, malfeasance, fraud, or other corruption and unethical actions (pp. 149–157). Importantly, citing Dobel (1999, p. 111), he also discusses addressing the difficult issues related to resigning in protest; see Dobel's chapter on "Getting out: The ethics of resigning from office" (pp. 109–129). (For more on research and practice guidance related to whistle-blowing and legally protecting whistle-blowers, see also Miceli et al. 2008).

Honesty, authenticity, and humility among other virtues help ensure that when you get into trouble, you handle yourself responsibly and ethically. Trouble may come in many ways, and there are at least three explanations of a public administrator's wrong behavior (Svara 2015, p. 106): "(1) explanations that focus on bad people, (2) explanations that apply to decent administrators who make unethical choices, and (3) explanations that stress circumstances." Public administrators can also err by making a mistake and not owning it or taking responsibility for it. Reamer (2013a, p. 182) explains that unethical actions tend to fall into two broad categories: "malfeasance," i.e., committing acts that violate professional ethical standards, or "nonfeasance," i.e., failing to perform an ethical duty. Moreover, acts can be technically legal but not ethical (such as enforcing a provision of a social policy that has disproportionate impact on a poor neighborhood) or possibly ethical but not legal (such as engaging in civil disobedience). Fortunately, since most laws in democracies tend to reflect accepted moral norms and priorities, in many situations legal and ethical standards align fairly closely.

In another example, your government may not have a specific policy against bribes in housing services, but that does not make taking a bribe to award a government contract ethical. Similarly, offensive behavior toward a colleague may not be illegal, but if you accidently mutter an expletive about your opponent on a policy issue into a microphone or call the opponent by a derogatory name on social media, take responsibility and issue an apology.

Leadership from public administrators can be illustrated in efforts to *promote ethical organizations*. Staff who serve the public, including those in private organizations under contract with government, should be trained and rewarded for

working to attain the highest standards of ethics, stewardship, and public service. Conducting an ethics audit can be an effective means to assess strengths and weaknesses in an organization's general work climate or to establish procedures related to ethical social policies and practice (Reamer 2001). Public administrators can encourage and influence the ethical conduct of others inside and outside their own organizations indirectly through exemplifying virtuous processes and directly by taking ethical stands. For example, a city manager might need to advocate for a policy that requires any housing development corporation seeking tax breaks to commit to including in its business outcomes more affordable housing and a park open to use by all in the community.

Administrators should *advance professional excellence*, their own and others'. To strengthen personal capabilities to act competently and ethically and encourage the professional development of others, administrators can engage in continuing education and make staff development a budget priority. For example, perhaps you know that several city council members go out to lunch after every meeting. They do invite the only woman on the council to join them, but she does not feel welcome. While going out to lunch does not violate the open meeting law in your country, the perception among some community members is that council members should not do it. You invite them to participate in training on open meeting laws and transparency, gently but clearly suggesting they stop this decades-long lunch routine.

In addition to texts cited in this chapter and other sources in the reference list below, Cooper's second edition of the *Handbook for Administrative Ethics* (2001) and Thompson and Leidlein's *Ethics in City Hall* (2009) are good resources for continuing education and further study of ethical administration of public policies; the latter includes an annotated bibliography and a selected list of films (pp. 153–168).

## Conclusion

This chapter presents a problem-solving framework for analysis of ethical issues and dilemmas involving social policies. While systematically considering moral implications in designing, implementing, or evaluating a social policy, public administrators must cultivate competencies required for policy practice. The intersection of social policy and ethics is complex and can be overwhelming when considered in addition to the full range of knowledge, skills, and virtues an effective administrator must possess. Even seasoned professionals are challenged by the sheer volume of theories, frameworks, and principles that comprise the ethics and social policy whole.

Indeed, research by Rest et al. (1999) indicates that gaining ethical competencies takes gradually moving from lower to higher, more mature levels of thinking. In the process of professional moral development, the ethical administrator focuses on the following competencies to guide practice and pursue further study (Cooper and Wright 1992, pp. 338–339). First, being able to assess one's character is fundamental. Then, to become ethically competent to work with social policies, public administrators should work on recognizing ethical issues and potential conflicts of interest inherent in work with a given social policy. They should learn to sort through competing values that often underlie social policies. They should apply perspectives from moral philosophy, and they should share their moral reasoning with others. Throughout their lives, they should cultivate virtues such as the courage, integrity, and practical wisdom needed to carry out ethical decisions and reflect on what was learned in the process. They should always refuse to partake in any unethical actions or policies. Ultimately, involving staff and citizens, they should help create and strengthen an ethical work climate in their organizations (Cooper and Menzel 2013). In addition to modeling fairness, equity, and other moral practices and processes, public administrators nurture ethical organizational climates by protecting whistle-blowers, curtailing preferential treatment of or deferral to special interest groups, and disciplining self-serving bias. Other specific competencies include:

- Putting public interest first
- Viewing oneself as a professional, not merely a technician

- Possessing a high degree of self-awareness, particularly knowledge of one's own primary values and vulnerabilities
- Becoming well-versed in one's professional code of ethics and laws related to social policy (reading the code annually on one's anniversary of hire or on the occasion of annual performance reviews is a good habit)
- Willingly consulting with others
- Building capacity for mature practice, including willingness to take responsibility for one's actions

See also Svara's eleven-point list of public administrators' duties, each of which will require competencies to act upon (2015, pp. 195–197).

Remember that administrators ARE policy practitioners, though many texts focus primarily on technical tasks, e.g., personnel management, finance, and policy implementation. "Successful public officials know how to influence policy" (Dobel 1999, p. 93). A mature practitioner will embrace the responsibility and excitement of ethical policy practice. This could include conducting an ethics audit of the organization, working to build or enhance an ethical climate, setting up an ethics committee, sponsoring forums on ethics, following a consistent process of decision-making when thorny ethical issues arise, and empowering oneself to ethically influence all steps of the social policy process, from formulation to evaluation. Ethical, transparent, and effective democratic policy practice involves citizens and others who may be affected by social policies, even to the point of global collaboration, in development, implementation, and improvement of policies and procedures.

# Ethics and Sustainability in Local Government

Haris Alibašić
Public Administration Program, College of Education and Professional Studies, University of West Florida, Pensacola, FL, USA

## Synonyms

Accountability; Ethics; Governance; Integrity; Local governments; Municipalities; Resilience; Sustainability; Sustainable development

## Definition

Ethics and sustainability are inseparable and integral to maintaining sustainable communities, and local governments have an obligation to track and report outcomes related to ethics and integrity in the sustainability plans.

## Introduction

By design, sustainability is an attempt of organizations to recognize and address the social, economic, environmental, and governance issues in strategic planning. Ethics may be intentionally included in the sustainability plan or be a by-product of a deliberate sustainability strategy. Reid (2009) believed sustainability to be an ethical framework (p. 29). The climate change, social inequalities, increased poverty levels, income gap, lack of access to health care, inadequate housing, and energy crisis are among some the most relevant issues facing communities and local governments. Given the lack of national programs addressing climate change, a broken tax system that disfavors urban areas, failing infrastructure, and absence of a comprehensive domestic energy policy, local governments are taking a very aggressive and proactive approach to become self-sustained and sustainable. Sustainability is at the core of the cities' service delivery, leadership, and community improvement. Saha (2009) conceptualized the sustainable development as "a policy paradigm." A system change and a new paradigm are needed for an actual implementation of sustainability within local governments.

Ethics and sustainability and ethics of sustainability are directly related. The ICMA's (2017) Code of Ethics requires its members to uphold the highest standards of conduct and integrity in providing services at the local government level, where the role of administrators is to serve the public and the interest of all the people all the time. Ethical responsibilities of local government administrators include the ability to plan ethically and with integrity. Poor planning is unethical and can lead to disastrous consequences. Over 600 years ago, Ibn Khaldun (1406, 1969), in his work The Muqaddimah: An introduction to history, warned of dire consequences for the inhabitants of the poorly planned towns and discussed the importance of air and water quality in consideration of town planning. The standard views of sustainability planning at the local level of authority are challenged continuously, re-evaluated, revisited, and reinvented.

Whether the imperative is rooted in morality, religion, social justice, or environmental ethics, the local government's sustainability planning activities are consistent with the notion of concerns over the finite nature of resources and the proper stewardship over the earth. Zaidi (1981) rejected the idea of a maximization of benefits from natural resources exploitation as unjust and argued for full consideration of environmental degradation from such practices. The commitment to sustainability predictably leads to improved social and environmental outcomes. Worrell and Appleby (2000) defined stewardship as the concept of "responsible use of natural resources" and acceptance of "significant answerability to society" (p. 275). The adverse effects on the environment and the society from economic development are often unrecognized, neglected, and ignored in plans, strategies, and reports.

## Sustainability Planning and Ethics in Local Governments

The foundation of the concepts of sustainability can be traced to the United Nations sustainable development goals, but also to earlier environmental and social justice initiatives. Since then the term sustainability, sustainable development, and Triple Bottom Line (TBL) were used to define a variety of initiatives aimed at supporting strategies encompassing economic, environmental, social, and governance goals. The more recent global efforts for sustainable future can be linked to the United Nations 2030 Agenda and the Paris Climate Accord (See more: Dimitrov 2016; UNGA 2015; Alibašić 2017). From the very beginning of sustainability efforts, local governments played an important and a leading role in supporting the notion of a just and equitable society through positive impacts in their communities. Importantly, sustainability has been expressed in the context of the economic situation of an organization, in alignment with the environmental and social justice issues, social responsibility, and governance (Alibašić 2017).

An essential complement to the ethics of sustainability is a fiscal responsibility as a critical

component of good governance. A stable organization can commit long term to the sustainability-related efforts. Good governance, ethics, integrity, transparency, community engagement, and accountability are vital elements necessary for attainment and implementation of sustainable policies and practices in organizations. In rare instances organizations practicing and implementing sustainability policies intentionally measure and report good governance, ethics, equity, integrity, transparency, and accountability aspects of sustainability. In evaluating and implementing sustainability initiatives, it is indispensable for organizations to integrate into plans and give full consideration to ethics, integrity, and governance.

## Accountability and Participative Citizenry

To be accountable for tax dollars spent, transparent in the delivery of services, and to provide the same level of services, cities administrators continually evolve and transform the long-term strategic planning. With a sustainability planning framework, cities can focus on the economic, governance, social, and environmental aspects of service delivery. Hemmati et al. (2002) noted that "basic societal processes related to sustainability are economic and social processes, and those of governance and political participation" (p. 40). The concept of citizen engagement in the delivery and planning of services preserves the democratic principle of participative governance.

An appropriate way to view an administrator is as an agent of the local or state government or any other form of government, and the local and state government as the people. Post (2006) argued the "citizens are free to engage in public discourse to make the state responsive to their ideas and values," which similarly applies to all levels of government (p. 28). Furthermore, Girardet (1999) saw the "popular participation in decision-making to restore confidence in local democracy" as essential to managing cities (p. 71). Local government must be transparent and more engaging with the public. Seeking compromise is the key to democratic governance and usually leads to neither strong nor weak government. Such notion of a participative decision-making process in local and other forms of governments is further supported by Ranney and Kendall (1951) in their understanding of democracy. In essence, the issues of equity, citizen engagement, accountability, transparency, and consensus building are all relevant to successful implementation of sustainability-related efforts.

Often, sustainability is seen as a tool for participation building. Portney and Berry (2010) discussed how sustainable communities with sustainable policies in place have more participatory residents and other interest groups, emphasizing the relevance of civic engagement in cities (Portney and Berry 2010). While active and participant citizenry in communities is critical to the implementation of policies, administrators have a role too in defining what Dubnick (2003) described as setting up "clear and well-defined expectations" (p. 417).

## Public Policy and Positive Social Change

Sustainability as a public policy for positive social change is critical to the basic concept of ethics of sustainability in local government. Defining such decisive instrument is difficult when determining the social change context. Defining the social change as a positive is very important as the potential for abuses of public policy as an instrument in creating the adverse social change continues to exist. The ethical norms and ethical standards for local government administrators, as encapsulated by the ICMA Code of Ethics, include "a deep sense of social responsibility as a trusted public servant" in executing policies for the betterment of the communities and organizations they serve. The positive social change from such service is an end goal for public servants. The effectiveness of environmental policies is relevant to economic growth and the nature of economic development. There is a balance, and similar to the private sector, sustainability for municipalities begins with the financial bottom line.

As the layers of the organization embrace sustainability and it becomes embedded within organizations, good governance, along with diversity, integrity, and transparency, coalesce around the basic tenants of sustainable development, economic, social, and environmental tenets. Public policies focusing on bringing about positive social change are essential. For example, the climate change bill and national energy policy have the potential for positive impact on the entire society. However, there has been no political consensus on passing those policies. Where the federal government in the United States failed to take a leading role in addressing the climate change concerns, subnational levels of government through local municipal leadership have filled in a void. American cities have been active in planning and implementing sustainability measures to counter the adverse impacts of climate change and to be more just, safer, and healthier communities.

## Ethics and Quadruple Bottom Line (QBL)

Most cities embrace the concept of Triple Bottom Line, focusing on economic, social, and environmental elements of sustainability in sustainability planning. However, there have been recent efforts in some cities around the globe, mostly in Australia using the Quadruple Bottom Line (QBL) in sustainability planning and reporting. In addition to the TBL pillars of sustainability, the QBL is intended to address governance (Alibašić 2017). The fourth component of sustainability, Governance, emphasizes the often-neglected areas of organizational sustainability, including ethics, integrity, financial resilience, community engagement, transparency, accountability, and ethics. It rewards staff involved in sustainability implementation with ownership of sustainability initiatives and helps the city administrators to track sustainability efforts using a holistic, organization-wide approach. The inclusion of governance strengthens all the parts of sustainability planning, ensuring sustainability efforts are thorough and implemented efficiently. The four pillars provide a robust framework for inclusion and measurement of ethics and integrity in the sustainability reports.

## Conclusion

Ethics in sustainability and the ethics of sustainability are instrumental for successful implementation of sustainability-related efforts and ultimately for sustainable communities. Over the years, researchers and practitioners have realized the limitations of using the Triple Bottom Line, and the implications of not measuring and reporting ethics, accountability, transparency, and other elements of good governance in sustainability plans. Ethical implications of sustainability planning and implementing sustainability-related efforts include more just, equitable, healthy, and environmentally resilient communities with an overall positive societal outcome. A solution to the lack of meaningful inclusion of ethics and integrity in sustainability would be a more deliberate approach to measuring ethics in sustainability plans, by applying the Quadruple Bottom Line. Ethics and sustainability are integral to sustainable communities, and local government administrators should track and report outcomes related to ethics and integrity in the sustainability plans.

# Ethics and the Nonprofit Sector

Colleen Casey
University of Texas at Arlington, Arlington, TX, USA

## Definition

Ethics: Well-based standards of right and wrong that prescribe what humans ought to do, usually in terms of duties, principles, specific virtues, or benefits to society

Public governance arrangements: These are defined as the multisector relationships and networks of organizations that have authority and accountability to act in the public interest

Neoliberalization: A regulatory state that prioritizes market-based, market-oriented, or market-disciplinary responses to regulatory problems and which has the potential to produce institutional differentiation across places

Nonprofit organization: An organization that exists for a broader purpose than to make a profit

Public interest: The welfare of the general public

## Introduction

Ethics is a central question in governance and organizational life. Ethics and ethical behavior by nonprofit organizations is increasingly important to the public interest in a world characterized by multisector, shared power governance relationships (Bryson et al. 2015). Menzel (2015) found that the study of ethics is alive and well in the public administration literature as it relates to research questions of ethical decision-making and moral development, ethics law and regulatory agencies, organizational performance, globalization, ethics management, policy ethics, and ethical environments. However, despite this breadth, a paucity of ethics studies investigate the growth of networking and public-private partnering in the public sector, minus a few notable exceptions here (2011), Cigler (2001), and Hudon (2011). The purpose of this chapter is to review current approaches to studying ethics and nonprofit organizations in public governance arrangements and offer suggestions for future research.

Public governance arrangements are defined as the multisector relationships and networks of organizations that have authority and accountability to act in the public interest. This definition encompasses partnerships to larger, multi-organizational networks composed of public, nonprofit, and private organizations. The chapter is important because nonprofits are unique

organizational actors that are governed by multiple sources of accountability. Nonprofits are subject to the organization's mission and the interpretation of the mission by managers, boards of directors, stakeholders, and clients as opposed to pure profit maximization (such as for-profit sector actors) or satisfying elected officials and citizens (such as public sector actors). The mission also influences the rules and regulations to which the Internal Revenue Service (IRS) holds nonprofits accountable. This occurs through their tax code and subject classification (IRS 2016). As nonprofits become engaged in public governance arrangements, they face additional sources of accountability from public agencies or organizations authorizing and regulating their action.

Secondly, nonprofits are distinct from private, for-profit, and public sector organizations as their ethical stance towards the world guides their action. Whereas public sector organizations aim to serve all members of the public, nonprofits often pursue particular issues, passions, or aim to serve specific target populations. As Rothschild and Milofsky (2006) summarize, nonprofits "are the organizational expression of their members' ethical stance toward the world: nonprofit organizations, by way of their very existence and practices, convey a public statement of what their members see as a better, more caring, or just world" (p. 137). The involvement of nonprofits in public governance arrangements makes the arrangements more fluid and contextual. Public governance arrangements become more fluid because nonprofits represent a wide variety of interests, elect to make the world a better place for certain populations, and may serve interests or purposes that are underrepresented in the general public. They enable public governance arrangements to be more contextual because nonprofits are unique and can respond to different types of public issues or needs, and thus, no two arrangements may look the same. The fluidity and contextuality nonprofits contribute to public governance arrangements can enhance responsiveness to the public interest; however, also raises a number of ethical challenges.

Finally, considering nonprofits and public governance arrangements is important due to the convergence of globalization and neoliberal policy ideas that heighten the potential for ethical conflict and tension. Although the term neoliberal has been used many ways, for the purposes here, neoliberal is conceptualized as a regulatory state that prioritizes market-based, market-oriented, or market-disciplinary responses to regulatory problems and which has the potential to produce institutional differentiation across places (Brenner et al. 2010). As Hasenfeld and Garrow (2012) argue, since the 1970s, neoliberal ideology has altered the "institutional, economic and political landscape for nonprofit organizations" (p. 297). Neoliberalization places nonprofit organizations in new relationships with the state and for-profit actors. Neoliberalization results in nonprofits taking on a variety of roles and functions, from direct public service providers to market competitors and social entrepreneurs. The result is that the nonprofit sector is characterized by those organizations that function more bureaucratic-like, as an extension of the state, to those that function as market competitors.

## Ethics and the Public Interest

Ethics can be defined as a branch of philosophy that refers to "well-based standards of right and wrong that prescribe what humans ought to do, usually in terms of duties, principles, specific virtues, or benefits to society" (adopted from Andre and Velasquez 1987 in Svara 2015, p. 12). Or, more basically, ethics is about doing what is right in the face of those served. The branch of normative ethics focuses on a general theory about how one ought to live or what one ought to do (von der Pfordten 2012). Approaches and alternatives to studying normative ethics stem from three traditional concepts in classical philosophical thought: deontology, consequentialism, and virtues. Deontology holds that some acts are morally obligatory regardless of their consequences for human weal or woe (Alexander and Moore 2015). Deontology holds that an ethical choice is personal and one acts or takes a certain course of action because to act is a duty or a right, not because of the end consequences of the act.

For example, a moral rule might be to "do unto others as you would like done to you." It is ethical because the action aligns with one's duty or right. Conversely, consequentialism is concerned with the consequences of action and emphasizes the ends of the action (Sinnott-Armstrong 2015). An act is ethical if it achieves some envisioned ends or purposes. One's duty, right, and moral obligation may be subordinate to the achievement of the envisioned ends or purposes. Finally, virtues ethics emphasizes one's moral character, and the value or virtue is what serves as the motivation to take ethical action (Hursthouse 2013). One acts because it is their character to do so, not because it is a duty or right and not because it will maximize individual ends.

In the organization theory and behavior literature, a central concern is the alignment between individual and organizational ethics. Individuals have different ethical compasses, and thus the organizational level considers how one's ethical values are realized, espoused, interpreted, and acted upon by administrators, executives, and employees. Key factors at the individual and organizational level that have been found to influence ethical action are organization structures and norms, leadership, organizational climate, organizational culture, moral awareness, decision-making, codes of conduct, intent and action, and cognitive biases (Fenton and Inglis 2007; Jurkiewicz and Massey 1998; Malloy and Agarwal 2001). Professional ethics expand beyond the organizational level to consider how professional standards can shape and inform individual action within a given profession and set of organizations. Professional ethics manifest themselves in professional codes of conduct that aim to govern the behavior of professionals in the field, seen and advocated in the nonprofit field by organizations such as the Council of Nonprofits. This literature is of importance for understanding ethical challenges within nonprofit organizations or within a professional sector but is less informative as to the ethical challenges nonprofits face in public governance arrangements.

A central concern of public governance arrangements is ethical behavior in the public interest. Cooper (2004) provides an overview and summary of key work on administrative ethics from the past 30 years. Of note in his review is that although there is a breadth of literature on public interest, there is less scholarship on administrative ethics and the public interest with the exception of Goodsell (1990) and Morgan (2001). A major challenge in this arena has been defining the term so that it has operational value. Public interest can be defined as the welfare of the general public. However, determining the public interest is more challenging. Public interest has been described as the aggregation of individual self-interests (Downs 1957) or more broadly as an evolving, common space that divergent groups and values share. In the latter instance, the public interest emerges from the common space shaped through the political process and individuals and groups having representation and access to inform this space. As Colm (1960) writes, "it is through the political debate, the vote, and the influence of pressure groups that the public interest evolves as a set of concrete objectives to be pursued by actual policy" (p. 302). Through articulations of the public interest, value systems are transformed into power structures, which manifest into specific public policies and activities. The path to the public interest has implications for the ethical challenges or dilemmas that can emerge in public governance arrangements.

The public administration literature offers promise for the study of ethical behavior of nonprofits in public governance networks. Two approaches, bureaucratic and democratic ethos, illustrate the ethical ramifications of different paths to the public interest. First, the bureaucratic ethos suggests that administrators in a democracy are both legally and morally bound to enforce the laws and implement the policies enacted by the people's democratically elected representatives (Woller and Patterson 1997). In this case, the administrator is the bureaucratic, neutral public servant, executing the will of the public that resulted through the democratic process. The public interest is realized through the political system, and in the case of the United States, through the system of representation. Bureaucratic approaches often focus on the adherence to the rules that are necessary in order for

individuals to carry out their work for the public they serve (Gilman and Lewis 1996). The basic idea is that the use of rules, and adherence to the rules, guides ethical behavior. Failure to do so results in unethical behavior. Adherence to the rules is necessary to realize the public interest.

The democratic ethos rejects that bureaucratic objectives can be readily or unambiguously determined from the political process and does not accept that politicians exercise control over the bureaucracy – rather, administrators also exist in an ethical space that leaves room for rule interpretation (Fox 1989). Administrators can enact democracy by interpreting this social space in favor of social equity as a value, or acting on the interest of a non-majority public. The democratic ethos approach shares a similar philosophical foundation with the broader definition of public interest, in that it is an active, evolving space, and suggests that administrators participate in the interpretation of the ethical space. The democratic ethos suggests that ethical behavior and dilemmas are not as black and white as simply following the rules. Rather, from this perspective, administrators may also be acting in the public interest when they act in favor for a disadvantaged group or incorporate democratic elements, such as public-participation and deliberation, into the process of rule-making and implementation.

## Nonprofits and Ethical Considerations in Public Governance Arrangements

As ethical actors, nonprofits bring a certain set of values to different types of public governance arrangements that serve different purposes in the policy process, from policy formation and analysis to implementation and service delivery. Nonprofits participate in governance networks that exist purposefully to inform the political process of policy-making. For example, they can provide a voice for underrepresented communities, serve as a vehicle to promote policy change, or engage and mobilize and build community leadership among different populations. For example, social movements are typically driven by nonprofit organizations seeking policy change.

However, at the same time, nonprofits are increasingly relied on to provide public or private services and programs, emerging as a more direct extension of the state (Salamon 1993). For example, in the area of housing and community development, nonprofit organizations have become key partners in the coproduction of low-income, affordable housing through the Low-Income Housing Tax Credit (LIHTC) program.

These role and function variations place nonprofits in a web of relationships with different partners, which may threaten their ability to retain an ethical commitment to their organizational issues, values, or passion. It may also threaten the ability for nonprofits to govern neutrally. For example, a nonprofit may be actively engaged in challenging the state; in another instance, they may be beneficiaries from a particular program or policy and subject to the rules of the state. As nonprofits become increasingly involved in different types of governance arrangements, the gray areas of ethical behavior and opportunities for ethical conflict become more prevalent.

## Ethical Issues and Nonprofits

Rhode and Packel (2009) identify six common areas where ethical issues arise in the nonprofit sector: compensation, conflicts of interest, publications and solicitation, financial integrity, investment policies, and accountability and strategic management. Some of these challenges are black and white, in that they clearly result in an outcome that is of detriment to society and are directly observable as it results in criminal violations or civil liability: fraud, misrepresentation, and misappropriation of assets. For example, it is clearly unethical (and illegal) to embezzle funds that belong to an organization for private or personal use. However, gray areas exist, which involves conflicts of interest, misallocation of resources, or inadequate accountability and transparency. For example, nonprofits serving multiple populations may face ethical dilemmas related to decisions they make in terms of resource allocations to improve the welfare of all clients. Nonprofits may face questions about difficult trade-offs such as how to allocate resources to

residents in one community or to another community. While this decision may not result in a direct violation of a rule or regulation, it creates a situation of ethical conflict for that organization.

However, additional study is necessary to understand the breadth and expansion of ethical gray areas when nonprofits become engaged in governance arrangements. Studies to date provide mixed evidence on the ethical behavior of nonprofits in governance arrangements such as public-private partnerships (PPPs) with a particular focus on public interest concerns. For example, Hudon (2011) suggests that PPPs circumvent traditional accountability and participation structures, potentially compromising the public interest. Kee and Forrer (2012) view PPPs as areas of gray – they may not be the solution to every public sector problem, they may be more prone to threatening democratic values, but its indeterminable if this is more or less than public organizations. Casey (2016) found that the outcomes largely depend upon the mission of nonprofits involved in the relationship and the governing structure of the relationship.

## Conclusion

In conclusion, the relationship between nonprofits, ethics, and public governance arrangements deserve further research. Ethical areas of gray seem to be more pronounced when nonprofits are engaged as service providers as it poses an ethical challenge to the virtue and character of nonprofits. As mission driven entities, the fulfillment of their mission often means meeting the needs of their clients. Yet, as recipients of public resources, their responsibility may be to be an efficient and effective steward of taxpayer's resources. While blending the two may be possible, it can also pose challenges and conflicts as the organizations subscribe to different philosophical interpretations of ethical action. Nonprofits bring virtue to what they do, and in most cases, this is what drives action. However, when entering into a contract with the public sector organization, the forces of consequentialism may dictate. As the forces of privatization and market-oriented governance increasingly emphasize the efficient and effective production and service delivery, this provides an ethical source of tension. Nonprofits may face situations that require them to consider how to most efficiently allocate the resources to fulfill a policy or program requirement, which can create ethical conflicts as it relates to what is valued as the moral course of action.

A second area that deserves more research attention is the ethical challenge nonprofits face in balancing multiple roles in the governance process. For example, a nonprofit with the mission to fight against poverty or homelessness may be recipients of public sector funds to provide services to these populations. However, the receipt of funds raises new ethical challenges as to how the nonprofit balances their mission of promoting policy change around this issue and fulfilling the public sector expectations of operating as a neutral servant of the state. Ethical questions also emerge as to for what purposes does the nonprofit organization advocate – is it purely advocacy in the best interest of the clients they serve or is it advocacy to ensure organizational survival? In different types of public governance arrangements, different ethical theories and approaches can converge. Thus, it becomes critical to understand the types of networks in which nonprofits participate, the expectations and roles they are expected to fulfill, the bureaucratic controls that govern their actions, and the ethical values driving or converging in a given governance arrangement.

## Introduction

The ethical conduct of public officials elected and appointed alike, and civil servants, has been a major focus of attention for the general public, the media, politicians, and public administrators for much of the twentieth and twenty-first centuries. Betrayed by high-level ethical infractions like Watergate, those in government found themselves under greater scrutiny than ever before. At the same time, attention to public officials' role as guardians of the public interest has been equally high. Emphasis is on the fact that the public interest should be viewed as a moral and ethical benchmark for public administrative decision making.

Yet, interest in and quest for ethics in government and public administration are not novel but rather date to ancient philosophers like Plato (428–347 BC) and Aristotle (384–322 BC), and the public interest too was addressed by philosophers Thomas Hobbes (1588–1679) and John Locke (1632–1704), among others.

It is important to note, however, that the scope of work for contemporary public administration and the diversity of those to serve have greatly changed from what pertained centuries ago. To date, public officials have to administer and manage expanded and varied interests of both the government and public including national security, social welfare, social services and infrastructure, health and disease control, collection of taxes, control of drugs, technology and cyber space, etc. All this means that for a public administrator, more difficult ethical challenges and dilemmas are encountered and more ethical choices have to be made. But what is ethics? Why is ethics important in public administration? What is public interest? What does it mean to serve the public interest? How can ethics engender the public interest? This brief entry offers answers to these questions. The goal here is to offer an overview of the concepts ethics and public interest that can function as a guide to those in government and those that wish to work in government, academics, and students of public administration as they navigate the ethical terrain.

## Ethics in Public Administration

The word ethics has been variedly defined, but most of the definitions include morality and determination of right from wrong (Lewis and Gilman 2012). Svara (2007, 10) defines ethics as "well-based standards of right and wrong that prescribe what humans ought to do, usually in terms of duties, principles, specific virtues, or benefits to society." This definition emphasizes the major ethics philosophical foundations encompassed in deontology (principle/Kantianism), teleology (utilitarianism/consequentialism), and virtue theory (personal traits). In his view, all ethical theories can inform the performance of public administrators; standards and principles guide action, personal qualities and traits guide ethical reasoning, and focusing on results and outcomes that serve the most justifies ethical action. Denhardt et al. (2014, 250) view ethics as a quest for moral guidelines: "the process by which we clarify what is right and wrong and by which we act on what we take to be right; it involves the use of reason in determining a proper course of action." Ethics viewed this way may appear contradictory: it bolsters conventional perceptions of accountability while at the same time fostering subjective thought and judgment in the framework of objective moral benchmarks. Yet, in public administration, the proper course of action is not always easy to determine, and the contemporary complexity of government and its roles make decision-making harder for bureaucrats.

Public administrators are responsible for implementing and managing public programs. In the fulfillment of these duties, they provide services and regulation to the public. Public administrators are not only required to be efficient and effective in carrying out their mandates but also to be responsive to the public, elected officials, political leaders, and different interest groups and clients and to understand constitutional values. By acknowledging the diversity and varied nature of public interests and needs to be served, the public administrator embraces the challenging role of reconciling competing and sometimes contradictory interests in the execution of laws and policies. It is no wonder then that administrative policies, choices, and decisions entail value judgments that can cause numerous impacts on the way public servants perform and how the public is served. It is because of the numerous obligations and the associated challenges like discretion and accountability and respect for constitutional values that public administrators need to be mindful of their ethical stance.

Being aware of ethical challenges does not mean capability to confront them. As James Madison observed, "If men were angels, no government would be necessary. If angels were to govern men neither external controls on government would be necessary" (Federalist Paper No. 51). In order to enhance ethical performance, formal

ethics training is offered, ethics audits are conducted, control mechanisms that enforce accountability and responsiveness are set up, formal rules and regulations are devised, and external control mechanisms like codes of ethics and codes of conduct are formulated to guide public administrators. While these mechanisms and external controls offer safeguards against unethical behavior, they do not guarantee it. Rather, each public administrator must face arduous, vague, and conflicting ethical dilemmas based on their internal standards of conduct embodied in their own personal virtues. It is the public servant's internal moral character and individual conscience that are critical in ensuring that administrative actions are ethical and in line with organizational goals, legal obligations, and general welfare. Anyone wishing to join the administrative system must appreciate that emphasis on ethics in public administration is meant to legitimate the role of the government, preserve public service integrity, and facilitate public servants to abide by their duties and professional standards, respect public trust, and ultimately serve the public interest.

## The Public Interest
